P R E F A C E

IN yet another internationally troubled year, clouded still further towards its close by the illness of King George VI, the Festival of Britain in 1951 made pleasant history. Not only in London and other large cities, where splendour is more readily achieved, but in country places the people of Britain came together to celebrate often in simple and engaging ways. The full story is not yet written but in this volume, the 1952 edition of the *Britannica Book of the Year*, an agreeable summary recaptures for the reader the chief events and the frontispiece recalls the South Bank scene.

Another item of more than usual interest to the friends of Britain was the Canadian Royal Tour. This, too, receives special treatment as does MACARTHUR, DOUGLAS, whose biography, unusually long, records the investigations which took place on the General's return to the United States. The reader's attention is also drawn to the table, occupying two pages, of MINERAL AND METAL PRODUCTION, and, at the end of the index, to the cumulative list of biographical articles published in the *Book of the Year* since 1949.

For Britain the year under review included another general election. This time there was a change of government and Mr. Winston Churchill, after six years as leader of the opposition, returned to power. Three of his ministers, not previously accorded a biographical article in the *Book of the Year*, are Mr. R. A. Butler, Sir David Maxwell Fyfe and Lord Woolton. Other new titles are COLOMBO PLAN, COUNCIL OF FOREIGN MINISTERS, JAPANESE PEACE TREATY CONFERENCE and ORNITHOLOGY ; fresh sections on Germany and Italy have been added to the article THEATRE.

A few articles, for one reason or another, have disappeared or changed their titles : Spanish American Literature is renamed LATIN AMERICAN LITERATURE and Food Research is included under the heading NUTRITION. Medical articles have been reduced in number ; the new titles, for example BLOOD, DISEASES OF THE, are wider in scope and make reference easier to related themes. Cross references and the index will assist the reader in doubt where to look for the information he requires.

JOHN ARMITAGE

London Editor.

EDITORS AND CONTRIBUTORS

WALTER YUST, Editor in Chief of Encyclopædia Britannica
JOHN ARMITAGE, London Editor

The initials and names of contributors to the Britannica Book of the Year with the principal articles written by them are given below. The arrangement is alphabetical by initials.

- A.A.At.** **Mathematics**
A. ADRIAN ALBERT. Professor of Mathematics, University of Chicago. Author of *Modern Higher Algebra*; etc.
- A.A.P.** **Greece**
ALEXANDER ALEXANDROU PALLIS, B.A. Minister Plenipotentiary attached to the Greek Embassy, London; Director, Greek Office of Information, London. Author of *Greece's Anatolian Venture—and After; In the Days of the Janissaries*; etc.
- A.Ar.** **Cinema (in part)**
ART ARTHUR. Executive Secretary, Motion Picture Industry Council, Hollywood.
- A.C.Ch.** **X-Ray and Radiology**
ARTHUR C. CHRISTIE, M.D. Chief, Department of Radiology, Doctors Hospital Medical Centre, Washington.
- A.Ck.** **English Literature (in part)**
ARTHUR CROOK. Editor and literary critic, London.
- A.Da.** **Football (in part)**
ALLISON DANZIG. Member of sports staff, *New York Times*. Author of *The Racquet Game*; etc.
- A.D.B.S.** **Art Exhibitions (in part); Painting (in part); etc.**
ANTHONY DAVID BERNARD SYLVESTER. Art critic, lecturer and broadcaster, London. Contributor to the *Burlington Magazine*, London, etc.
- A.D.I.s.** **Entomology**
ANTHONY DAVID LEES, M.A., Ph.D. Senior Scientific Officer, Agricultural Research Council Unit of Insect Physiology, Cambridge.
- A.Dr.** **Textile Industry (in part)**
ALFRED DAWBER, Mem. Text. Inst. Director, Emmott and Company, Ltd., technical publishers, Manchester. Editor, *Textile Manufacturer*, Manchester; compiler of *Textile Manufacturer Year Book*; etc.
- Ae.** **Rackets; Tennis**
LORD ABERDARE, B.A., C.B.E. Chairman, National Association of Boys' Clubs. Former rackets and tennis amateur champion of Britain, U.S. and Canada. Author of *First Steps to Rackets* (with E. B. Noel), etc.
- A.Flo.** **Latin American Literature**
ANGEL FLORES. Chairman, Latin-American Area Studies, and Professor of Latin-American Literature, Queens College, Flushing, New York. Author of *Lope de Vega; Cervantes Across the Centuries; The Kafka Problem; Fiesta in November*.
- A.G.Br.** **Dyestuffs (in part)**
ANSO G. BRUINIER, Jr. Technical Advertising Manager, Dyestuffs Division, Organic Chemicals Department, E. I. du Pont de Nemours and Company, Inc., Wilmington, Delaware.
- A.G.L.I.** **Hospitals (in part); Nursing**
ARTHUR GLENDINNING LOVELACE IVES, M.V.O., M.A. Secretary, King Edward's Hospital Fund for London. Author of *British Hospitals*.
- A.H.H.** **Venereal Diseases (in part)**
ARTHUR HERBERT HARKNESS, F.R.C.S., L.R.C.P. Director (Venereology), Institute of Urology, London; Surgeon, Lock Hospital, London; Dermatologist, London Skin Hospital. Author of *Non-gonococcal Urethritis*.
- A.H.J.B.** **Docks and Harbours (in part); etc.**
ALFRED HENRY JAMES BOWN, O.B.E., F.C.I.S., M.I.T. General Manager and Clerk, River Wear Commissioners, Sunderland. Author of *Port Operation and Administration* (with C. A. Dove).
- A.H.Ld.** **Forestry (in part)**
ARTHUR HENRY LLOYD, O.B.E., M.C., T.D., M.A. Lecturer in Forestry, University of Oxford. Author of *Engineering for Forest Rangers*.
- A.Hw.** **Cancer**
ALEXANDER HADDOW, M.D., D.Sc., Ph.D., F.R.Soc.Med. Professor of Experimental Pathology, University of London (at the Institute of Cancer Research); Director of the Chester Beatty Research Institute, Royal Cancer Hospital, London.
- A.J.A.** **Social Security, U.S.**
A. J. ALTMAYER. Commissioner, Social Security Administration, Federal Security Agency, Washington.
- A.J.Ar.** **Industrial Health (in part)**
ARTHUR JOSEPH AMOR, C.B.E., M.D., M.Sc., D.I.H. Principal Medical Officer, Imperial Chemical Industries, Ltd., London. Author of *An Atlas of Silicosis; The Chemical Aspects of Silicosis; Notes on the Toxicity of Solvents*.
- A.J.Coe.** **South African Literature (in part)**
ABEL JACOBUS COETZEE, M.A., D.Litt., D.Lit. et Phil. Professor of Afrikaans Linguistics and Folklore, University of the Witwatersrand, Johannesburg, South Africa. Author of *Groei van die Afrikaanse Kultuurgedagte aan die Rand*, etc.
- A.J.Hy.** **Advertising (in part)**
ARTHUR JAMES HEIGHWAY. Editor and Managing Director, *World's Press News*, London.
- A.J.Ll.** **Spirits (in part)**
ALFRED J. LIEBMANN. President, Schenley Research Institute, New York.
- A.J.Macd.** **Anglican Communion; Church of England; etc.**
ALAN JOHN MACDONALD, D.D., F.S.A., F.R.Hist.S. Prebendary of St. Paul's; Rural Dean of the City of London and Rector of St. Dunstan-in-the-West. Author of *Lanfranc, His Life, Work and Writing; Hildebrand*; etc.

DIARY OF EVENTS, 1951

JANUARY

1: Great Britain. The strength of the armed forces at home and overseas was 751,700. (Ministry of Defence return, Feb. 27, 1951.)

Albania. The Ministry of the Interior announced that 29 spies, dropped by parachute or landed from a submarine, had been "annihilated".

Korea. Chinese and North Korean troops attacked the U.N. left flank in force, crossed the frozen Imjin river east of Kaesong and advanced to within 20 mi. of Seoul.

Nepal-India. Joint discussions on constitutional reform in Nepal, begun in Delhi on Dec. 26, 1950, were concluded.

South Africa. E. G. Jansen succeeded Gideon Brand van Zyl as governor general.

2: Hungary. Rationing of sugar and flour began.

3: Jamaica. The riot act was read and tear-gas used by the police against striking sugar workers who attacked strike-breakers at Kingston.

Korea. U.N. troops abandoned Seoul, after the whole U.N. line had been withdrawn on Jan. 2.

4: Commonwealth. The Commonwealth Prime Ministers' conference began in London.

Korea. Inchon, on the west coast, was abandoned by U.N. forces.

5: Korea. The first award of the Victoria Cross in the Korean war, made posthumously to Major Kenneth Muir, was announced.

N.A.T.O. It was announced that Italy would contribute three divisions to the N.A.T.O. force.

Pakistan-Germany. The state of war between the two countries ended.

U.S.S.R. The Soviet government received notes from the British and French governments on the subject of German demilitarization and western defence, refuting charges of aggressive preparations.

6: Korea. It was announced that U.N. troops had abandoned Hongchon.

Netherlands-Spain. Count van Rechteren Limburg, Netherlands minister in Cairo, was appointed Netherlands ambassador to Spain, the first since 1946.

7: Commonwealth. Liaquat Ali Khan, prime minister of Pakistan, arrived in London to attend the Commonwealth Prime Ministers' conference.

Korea. Wonju was abandoned by U.N. forces but was later retaken.

N.A.T.O. General Dwight D. Eisenhower, supreme commander of the N.A.T.O. forces in Europe, arrived in Paris to begin a tour of European capitals.

8: Great Britain. An order made by the minister of fuel and power prohibiting

shop-window and advertisement lighting came into effect.

Great Britain-Spain. Sir John Balfour, British ambassador in Buenos Aires, was appointed ambassador to Spain, the first since 1946.

France. A special rearmament budget of Fr. 355,000 million was passed.

Korea. U.N. troops abandoned Osan, 28 mi. south of Seoul, and Wonju.

9: Great Britain. The government announced that the east African groundnuts scheme would be continued as an experiment, and that the £36.5 million—the amount granted to the Overseas Food corporation by March 1951—would be written off.

Australia. Dock workers in all ports stopped work for 24 hr. in protest against a 10s. 8d. a week wage increase award, instead of a £A1 award.

Cricket. Australia defeated England by an innings and 13 runs in the third test match at Sydney.

10: Korea. U.S. troops of the U.N. command, with French elements, re-took Wonju.

11: Great Britain. An agreement for increased wages for certain employees in

the coal-mining industry was concluded between the National Coal board and the National Union of Mineworkers.

United Nations. The cease-fire committee at Lake Success, New York, called for an immediate armistice in Korea and a conference between Great Britain, the U.S., the U.S.S.R. and the Chinese People's republic to discuss far eastern problems.

Power. The World Power conference, and meetings of international commissions on irrigation and canals, and large dams, opened in Delhi.

12: Commonwealth. The Commonwealth Prime Ministers' conference ended in London.

Argentina-France. An agreement providing for the exchange of goods to the value of Fr. 99,000 million was signed in Buenos Aires.

United States. The president approved a programme increasing the armed forces to more than 3,460,000 by the end of June.

13: Great Britain-U.S.-France. The three governments announced that international "commodity groups" would be set up representing the governments of those countries in the free world with a special interest in the commodity concerned.

Italy. The Senate passed a motion reaffirming Italy's subscription to the North Atlantic treaty and expressing confidence in the government's foreign policy.

United Nations. The political committee of the general assembly decided by 45 votes to 5, with 8 abstentions, to transmit cease-fire proposals for Korea, tabled by Israel, to the Chinese Communist government.

14: Indochina. A Vietminh offensive was launched north of the Red river delta on a 75-mi. front.

15: Czechoslovakia. Two Roman Catholic bishops accused of treason and espionage at Bratislava received life sentences, and a third 24 years' hard labour.

Germany. In a broadcast reply to the East German prime minister's proposals of Nov. 20, 1950, the West German chancellor postulated political and personal freedom in Eastern Germany as a prerequisite of all-German elections.

Ilse Koch, wife of the former commandant of Buchenwald concentration camp, was sentenced by a German court at Augsburg to life imprisonment.

Korea. U.N. forces recaptured Osan, Kumyangjang and Chon in western Korea; they also re-took Suwon, 17 mi. south of Seoul, but withdrew from the Wonju salient.

16: Austria-Yugoslavia. The state of war between the two countries ended.

Denmark-Norway-Sweden. The foreign

- ministers met in Copenhagen for discussions on common foreign policy problems.
- 17: **Great Britain.** Aneurin Bevan, minister of health, was appointed minister of labour and national service, George Isaacs, minister of labour, became minister of pensions, and H. A. Marquand, minister of pensions, became minister of health. Hugh Dalton, minister of town and country planning, became minister of local government and planning when his department took over certain responsibilities of the minister of health.
- Finland.** A coalition cabinet was formed; Urho Kekkonen remained prime minister.
- Korea.** The Chinese government rejected the U.N. proposals for a cease-fire and put forward other proposals.
- Pakistan.** General Muhammad Ayub Khan became c. in c. of the army in succession to General Sir Douglas Gracey, a British officer.
- 18: **Great Britain.** The report was published of the Broadcasting committee, which began work in 1949 under the chairmanship of Lord Beveridge.
- Berlin.** Ernst Reuter (Social Democrat) was re-elected lord mayor of West Berlin, after a tie with his opponent Walter Schreiber (Christian Democrat) on Jan. 12.
- Italy.** Communist rioting near Palermo and at Adrano (Sicily), and at Comacchio (Emilia) over the arrival in Italy of General Dwight D. Eisenhower, N.A.T.O. supreme commander, resulted in deaths and injury.
- United States.** It was announced that a "major portion" of the air reserves and national guard would be called up for service immediately.
- 19: **Hungary.** Members of foreign diplomatic missions were made subject to a travel restriction to within 30 km. of Budapest.
- Indochina.** Vietminh activity slackened and French troops consolidated their positions; Vietminh casualties in the attack on Hanoi, Jan. 12-19, were over 8,000; French and Vietnamese losses were 43 killed, 160 wounded and 545 missing.
- Korea.** U.N. forces re-occupied Wonju. U.S. casualties in Korea up to this date were 6,693 killed, 30,251 wounded and 9,257 missing.
- 20: **Great Britain-Yemen.** A mutual aid agreement between the two countries became effective.
- U.S.S.R.** Soviet notes to Great Britain and France rejected the western powers' attitude towards the question of German demilitarization as expressed in their notes of Jan. 5.
- 21: **Korea.** After changing hands several times Wonju was again abandoned by U.N. troops.
- 22: **Malaya.** The call-up each month into the security forces and re-settlement organization of 1,000 men between the ages of 18 and 24 was announced.
- Spain-Pakistan.** A trade agreement was signed in Madrid.
- 23: **Netherlands.** Lieut. General H. J. Kruls resigned from his post of chief of the general staff.^o
- South Africa.** It was announced in Washington that the International bank had made loans amounting to \$50 million to South Africa for transport and electric power development.
- U.S.S.R.** Identical notes on a four-power conference were received from the British, French and U.S. governments.
- 24: **Korea.** A U.N. patrol entered Hoengsong, 10 mi. north of Wonju.
- Netherlands.** D. U. Stikker, Liberal foreign minister, resigned following criticism of government policy on New Guinea; the rest of the cabinet then resigned.
- 25: **France.** General Alphonse Juin was appointed inspector general of the French forces; he continued as resident general in Morocco.
- Aviation.** The Swedish, Danish and Norwegian air lines were amalgamated to form the Scandinavian Airlines System (S.A.S.).
- 26: **France.** The government ordered the dissolution of the Paris headquarters of the Communist-sponsored World Federation of Trade Unions, World Federation of Democratic Youth and International Democratic Federation of Women.
- Greece.** The cabinet resigned following decisions to reduce its size for the sake of economy and efficiency.
- Korea.** Strong U.N. forces recaptured Suwon and Kumyangjang.
- United States.** The government ordered a general price and wage "freeze."
- United States-Peru.** An agreement for U.S. technical aid to Peru under the "Point Four" programme was signed in Lima.
- 27: **Austria-Yugoslavia.** An agreement between the two countries formally restored diplomatic relations.
- Finland.** Field Marshal Carl Gustaf Emil Mannerheim, former president and commander in chief, died at Lausanne, Switzerland.
- France-United States.** René Plevin, French prime minister, arrived in the U.S. for discussions with President Truman.
- 28: **Korea.** U.N. troops advanced to within 12 mi. of Seoul.
- 29: **Great Britain.** The prime minister, Clement Attlee, announced that 235,000 members of the class Z army reserve and 10,000 of the R.A.F. class G reserve would be called up for 15 days' training in the summer. He also stated that the defence estimate for the financial year 1951-52 was £1,300 million.
- Netherlands.** Queen Juliana asked D. U. Stikker to form a new government.
- South Africa.** A vote of censure on the government was rejected by 82 votes to 69 in the House of Assembly; a counter-motion of confidence was passed by 82 votes to 70.
- 30: **Germany.** The East German Volkskammer addressed an appeal for an all-German council to the West German Bundestag.
- Israel-Yugoslavia.** A trade agreement between the two countries was signed in Tel Aviv.
- Korea.** South Korean troops entered Kangnung.
- 31: **Great Britain.** A new issue of saving certificates and defence bonds, at an improved rate of interest, was put on sale.
- Brazil.** Getulio Dornelas Vargas was sworn in as president.
- Korea.** A joint Belgian-Luxembourg battalion arrived to join the U.N. forces in Korea.
- Western Germany.** The U.S. authorities commuted the death sentence of 21 German war criminals and shortened the prison sentences of 70 others. It was also announced that the decree confiscating the property of Alfred Krupp had been cancelled.
- Aviation.** Captain Charles Blair, U.S., set up a new record of 7 hr. 48 min. for the New York-London flight in a Mustang aircraft powered by a Packard-built Rolls Royce engine; the previous record was 8 hr. 55 min.

FEBRUARY

- 1: **United Nations.** The general assembly was convened at Lake Success, New York, and ratified the political committee's decision to brand China an aggressor by 44 votes to 7 with 9 abstentions.
- Western Germany.** Travel control became the responsibility of the German authorities and German passports were again issued.
- 2: **Arab League.** The session in Cairo ended; a collective security pact was signed by all members except Jordan.
- France-Canada.** René Plevin, French prime minister, arrived in Ottawa from the U.S.
- India-France.** An agreement was signed in Paris, ceding Chandernagore to India.
- Netherlands.** Queen Juliana asked Willem Drees and Theodorus van Schaik to form a government.
- 3: **Western Germany.** An interim trade agreement was signed with Eastern Germany.
- 4: **Great Britain.** The carcass-meat ration was decreased from 10d.- to 8d.-worth.
- 5: **Western Germany.** A three-day conference of U.S. ambassadors and state department officials in western Europe opened in Frankfurt.
- 6: **Great Britain.** Parliament approved supplementary service estimates of £40 million for the current financial year.
- South Africa.** Patrick Gordon Walker, British secretary of state for Commonwealth relations, arrived in Capetown for discussions.
- 7: **Great Britain.** An opposition motion of censure in the House of Commons on steel nationalization was defeated, 308-298.

- United Nations.** The withdrawal of Hungary from the F.A.O. was announced.
- A Soviet draft calling upon the Security Council to take immediate steps for the cessation of U.S. aggression against China in Formosa and the Formosan straits was rejected by 49 votes to 5 with 3 abstentions.
- United States-U.S.S.R.** A note was handed to the Soviet ambassador in Washington demanding that the U.S.S.R. should return 672 naval and merchant ships transferred under lend-lease during World War II.
- 8: **Great Britain.** An opposition motion of censure charging mismanagement in the supply of meat was defeated by 306 votes to 298.
- Tunisia.** Decrees provided that the Tunisian prime minister, not the French resident general, would preside over the cabinet, and allocated a proportion of civil service posts to Tunisians.
- Cricket.** Australia won the fourth test match against England at Adelaide by 274 runs.
- 9: **Pakistan.** The second meeting of the World Moslem conference opened in Karachi.
- Western Union.** The Brussels treaty powers announced the appointment of Air Chief Marshal Sir Hugh Saunders as commander in chief, air forces, western Europe, in succession to Air Chief Marshal Sir James Robb.
- 10: **Great Britain.** 19,600 dockworkers were on unofficial strikes in London, Merseyside, Manchester and Salford.
- Germany.** In a speech at Bonn university, Konrad Adenauer, West German chancellor, said that discussions with Eastern Germany could take place only after all Eastern German political prisoners had been released.
- Gold Coast.** Voting was completed in the elections, the results being: Convention People's party, 38 seats; Independents, 34; United Gold Coast Convention, 3.
- Ireland.** The strike of bank officials, begun on Dec. 23, 1950, ended.
- 11: **Australia.** Frederick Doidge, New Zealand minister of external affairs, arrived in Sydney for conferences with P. C. Spender and John Foster Dulles on a Japanese peace treaty.
- Korea.** U.N. patrols re-entered Seoul.
- 12: **France.** The Bulgarian, Rumanian and Albanian representatives in Paris were informed that they would be subject to certain restrictions within French territory.
- Korea.** A Communist force estimated at 100,000 attacked on a 30-mi. front in the central sector of Korea at midnight on Feb. 11-12.
- Persia.** The Shah, Mohammed Riza Pahlavi, was married in Tehran to Suraya Isfandiari Bakhtiari.
- 13: **Japan.** Shigeru Yoshida, prime minister, stated that in the talks with John Foster Dulles he had accepted the U.S. offer of military assistance.
- 14: **Great Britain.** A two-day debate on defence was opened by Emanuel Shinwell, minister of defence.
- Israel.** After a government defeat in the Knesset on religious education, David Ben-Gurion, prime minister, announced his resignation.
- Japan-U.S.S.R.** At the Allied council in Tokyo, General Aleksey Kislenko, Soviet delegate, charged the U.S. with remilitarizing Japan.
- Morocco.** The French resident general, General A.-H. Juin, opened discussions with the sultan on Moroccan nationalist activities.
- 15: **Great Britain.** The opposition motion of censure on defence was defeated in the House of Commons by 308 votes to 287.
- The Conservatives retained the seat in the Bristol West by-election, when Sir Walter Monckton was returned with a majority of 17,144.
- France.** A conference called on French initiative to discuss the formation of a European army opened in Paris.
- Greece-Yugoslavia.** After an interval of nearly ten years, railway and postal services were restarted between Greece and Yugoslavia.
- Nepal.** King Tribhuvana returned to Kathmandu after his three-month exile in India.
- Western Germany-United States.** The first U.S. conscripts arrived for service in Western Germany.

- Switzerland.** The two houses of parliament, in joint session, elected a new government for a term of four years.
- 14: **Nepal.** Maharaja Mohan Shumshere Rana, former hereditary prime minister, left Kathmandu for Bombay.
- 15: **Finland.** Parliament passed an emergency law giving the government powers to curb inflation.
- Indochina.** The battle for Hoa-Binh ended in favour of the French and Vietminh forces after about 7,000 Vietminh casualties had been inflicted.
- Western Germany.** Forty-five war criminals were released by the British and U.S. authorities in a Christmas amnesty.
- 16: **Egypt.** The minister of the interior announced that the government would release the property of the Moslem Brotherhood, sequestered in 1948.
- Uruguay.** As the result of a plebiscite, the presidency was abolished and replaced by a council of nine.
- 17: **Great Britain.** Winston Churchill and Anthony Eden arrived in Paris for talks with French ministers.
- The London Foreign Exchange market, closed since 1939, was reopened for forward dealing in currencies.
- 18: **International Court of Justice.** The court, in its judgment on the British-Norwegian fisheries dispute, decided by 10 votes to 2 that the method employed by Norway for the delimitation of the fisheries zone was not contrary to international law.
- Korea.** Communist and U.N. representatives at Panmunjom exchanged lists of prisoners of war.
- 19: **Korea.** At Panmunjom the U.N. delegates protested that the Communist list of war prisoners was incomplete; the Communists complained that the U.N. list was useless because the prisoners' names were in Latin characters; the U.N. delegates promised to supply a list in Chinese or Korean characters.
- United Nations.** The political committee voted in favour of the western powers' proposals for a disarmament commission. The *ad hoc* political committee adopted the western resolution for a commission to examine the possibility of holding free elections in Eastern and Western Germany.
- Cricket.** The second India-England test match ended in a draw in Bombay.
- 20: **Muscat-Great Britain.** A treaty of friendship, commerce and navigation was signed at Muscat.
- United Nations.** The assembly adopted the *ad hoc* political committee's resolution for a German election commission.
- 21: **Egypt.** General Erskine, the British c. in c., imposed a dusk-to-dawn curfew in key areas of Ismailia.
- France.** A strike of the flying staff of Air France began.
- United States.** One hundred and nineteen men were killed in an explosion at the West Orient bituminous coal mine at West Frankfort, Illinois.
- 22: **Czechoslovakia.** It was announced that Jaromir Dolansky, head of the state planning commission, would succeed Rudolf Slansky as a vice premier.
- Egypt.** Ibrahim Farag, acting foreign minister, stated that Egypt would not submit its dispute with Great Britain to U.N.
- Greece.** Parliament ratified the revised constitution by 132 votes to 8, the Greek Rally abstaining.
- Rugby Football.** South Africa beat Wales by 6 points to 3 at Cardiff.
- 23: **Hungary-United States.** The four members of the crew of the U.S. bomber forced down in Hungary (see Dec. 3) were fined 360,000 forints (\$30,000) each for violation of the Hungarian frontier.
- Exploration.** The relief ship "Norsel" arrived at Maudheim, Antarctica.
- 24: **Libya.** Independence was formally proclaimed and the Emir Idris es-Senussi ascended the throne as Idris I, king of the United Kingdom of Libya.
- 25: **Great Britain.** A recording of King George VI's Christmas Day message was broadcast. The king had made the recording beforehand to avoid strain on his voice following his lung operation.
- South Africa.** Forty-one Africans were killed and 500 injured in clashes between tribal and other factions on the outskirts of Johannesburg.
- Cricket.** The West Indies beat Australia by six wickets in the third test match at Adelaide.
- 26: **Bulgaria.** A court in Sofia condemned to death 4 of 10 men accused of spying.
- Egypt.** General Erskine stated that if Egyptian "youth commandos" entered the canal zone to attack British troops he would be compelled to crush them.
- Korea.** General Ridgway was authorized to extend the 30-day period for agreement on an armistice for 30 more days.
- 27: **Egypt.** After further clashes between students and the police, the authorities ordered colleges and secondary schools in Cairo to be closed.
- United States-U.S.S.R.** It was announced that George Kennan had been nominated U.S. ambassador to the Soviet Union.
- Sport.** *Soviet Sport*, organ of the Soviet Union sports committee, announced that Russia would participate in the Olympic Games, Helsinki, 1952.
- 28: **Korea.** It was announced in the *London Gazette* that Private W. Speakman, Black Watch attached to King's Own Scottish Borderers, had been awarded the Victoria Cross.
- Lawn Tennis.** Australia held the Davis cup, beating the U.S. in the challenge round at Sydney.
- 29: **Korea.** The U.N. delegation made their final truce proposals.
- 30: **Persia.** A ban on travel abroad was announced.
- 31: **Great Britain-United States.** Winston Churchill, the British prime minister, and Anthony Eden, foreign secretary, sailed for the U.S. in the "Queen Mary."
- Indonesia.** The acting foreign minister announced that Indonesia had recognized Farouk as king of Egypt and the Sudan.

BOOK OF THE YEAR

ABYSSINIA: *see* ETHIOPIA.

ACCIDENT PREVENTION. *Road Safety.* The British government's National Road Safety campaign was continued in co-operation with the Royal Society for the Prevention of Accidents. The year's theme, linked to the Festival of Britain, was "Courtesy." Television and broadcast items included hints to overseas visitors.

One thousand local road safety committees held an average of 450 meetings a month and co-operated in a national safety week. Monthly statistics were published in the press. In June 1951, road casualties since the war reached the total of one million. *Fatal Road Accidents to Children—1950* showed that 1950 had the lowest child fatality total for 25 years. The improved trend continued during 1951.

The Pedestrian Crossings (General) Regulations, 1951, came into operation on Oct. 31. Their main provision was for precedence to pedestrians at authorized uncontrolled crossings only, in the vicinity of which vehicle waiting or parking was restricted. All authorized crossings were painted in zebra (black and white) lines.

Organizations and the public protested at limiting the number of crossings by two-thirds, demanded by the Ministry of Transport. The National Safe Driving competition was to withhold awards to drivers convicted under the pedestrian crossing regulations. The government's Committee on Road Safety set up sub-committees to consider (i) motor-cycling accidents and (ii) suggestions for making law of parts of the Highway code. The minister of transport addressed the National Safety congress, attended by 1,000 delegates, including representatives of overseas safety organizations.

The "Aetna Roadometer," a mechanical driving tester, giving an automatic analysis of driving characteristics, was sent from the United States by the Aetna Life Affiliated companies for showing at the congress. A new rear-projection cinema and mobile training centre was opened by the parliamentary secretary to the Ministry of Transport (Lord Lucas).

The Ro.S.P.A. assisted in preparing a paper presented at the Lisbon congress of the Permanent International Association of Road Congresses. Great Britain was represented on a working party on the prevention of road accidents (convened by the Inland Transport committee of the U.N. Economic Commission for Europe), which suggested uniformity in international statistics, temporary withdrawal of licences of drivers under the influence of drink involved in accidents, production of an international handbook on road safety and organization of an international propaganda campaign. More than 270,000 drivers were entered in the National Safe Driving competition. Two drivers received the society's award for 32 consecutive years of safe driving. The House of Lords debated "The problem of road accidents with special reference to road improvements and maintenance." The Ro.S.P.A. displayed at the Ideal Home exhibition, International Motor show, Cycle and Motor-cycle show and the transport section of the South Bank exhibition. *The Times* re-published letters and articles in a

booklet *Accidents on the Road*. A reprinted series of Highway Hints appeared in the *London Evening News*.

Home Safety. The report of the government's Interdepartmental Committee on Home Accidents, published after four years' work, stated that a substantial reduction of home accidents would depend on improvement of domestic appliances and greater public awareness. The Home Office electrical branch reported on 42 fatal home electrical accidents during 1950. The Board of Trade issued warnings against the use of an imported toy iron which could be connected to normal electrical equipment. Press publicity was given to the danger of leaving children unattended at home.

Recommendations for an adequate fire-guard were issued by the Women's Advisory Council on Solid Fuel. A report appeared of an enquiry by the chief scientific advisory division, Ministry of Works, into domestic accidents relating to building design. The research group of Old People's Welfare was investigating safe furniture designs. An exhibition on home fire prevention was staged jointly by the L.C.C. and the Home Office. The Ideal Home exhibition included a stand on home safety.

Industrial Safety. A national industrial housekeeping week was held in April and chambers of commerce, local

One of the "Zebra" pedestrian crossings which, in Nov. 1951, replaced the Belisha crossings.

authorities and industry generally co-operated. A "People at Work" conference, organized jointly by the Industrial Welfare society, the National Institute of Industrial Psychology and the Ro.S.P.A. was opened by the minister of labour and national service.

The 1951 National Industrial Safety conference and exhibition was held in May. Other conferences included a chemical works safety conference and the fifth annual conference of the Industrial Safety Officers' section.

Industrial safety stands were included in the Engineering, Marine and Welding exhibition and the Manpower exhibition at the Safety, Health and Welfare museum; a Birmingham industrial safety exhibition included displays showing how adoption of safety devices has reduced accidents.

The annual report of the chief inspector of factories for 1949 was published. It stated that reportable accidents fell by over 8,000. Accidents to young persons continued to decrease; in 1949 they numbered 9,000 as compared with 24,000 in 1944. The latest report of the chief inspector of mines (1949) showed reductions in fatal and non-fatal accidents. The chief inspector of factories set up committees to consider safety problems in the use of hydraulic presses and press brakes.

Revised preliminary draft regulations as to safety, health and welfare concerning engineering were published. A memorandum by the senior electrical inspector of factories on the electricity regulations was published for the first time since 1934.

Guide to the Regulations of the Factories' Act, 1947-48; Guide to the Building (Safety, Health and Welfare) Regulations, 1948 (prepared by the I.C.I.); *Eye Protection for Industrial Workers; Supervisor's Guide to the Building Regulations*; and two new I.C.I. codes—*Portable and Transportable Plant and Equipment and Railways and Haulages (Design)* were published by the Ro.S.P.A.

A paper was given by C. Oakley at the British Association for the Advancement of Science on the prevention of industrial accidents. Eleven Ro.S.P.A. poster designs were included in the 1951 National Poster Exhibition among examples from 17 countries.

(H. Su.)

TABLE I. ACCIDENTAL DEATHS AND INJURIES IN GREAT BRITAIN

	Killed		
	1948	1949	1950
Railways	367	321	316
Roads	4,513	4,773	5,012
Coal Mines	468	460	493
Factories	861	772	799
	Injured		
Railways	30,050	29,311	27,016
Roads	148,884	172,006	196,313
Coal Mines	182,600	229,000	237,800
Factories	200,225	192,210	192,260

TABLE II. ACCIDENTAL DEATHS IN AND ABOUT THE HOME, ENGLAND AND WALES

	1947	1948	1949
Falls and Crushing	4,001	3,498	3,591
Drowning	1,149	984	988
Burns, Scalds and Conflagrations	904	651	667
Suffocation	1,054	838	797
Others	1,482	1,315	1,398
Total	8,590	7,286	7,441

United States. Accidents caused 90,000 deaths in the United States in 1950. Information available at the end of Oct. 1951 indicated that the 1951 accidental death total would be somewhat higher than in 1950. In addition to the deaths, accidents in 1951 also caused more than the 1950 total of 9 million non-fatal injuries. In Dec. 1951 the millionth traffic accident fatality occurred, the first fatal motor vehicle accident on record having occurred in Sept. 1899.

Several hundred members of the committees and sub-committees of the President's Conference on Industrial

Safety met in Washington in May to report on progress made on programmes agreed upon the previous year. It appeared, late in 1951, that the year's toll of occupational accident fatalities would probably be a little greater than the 1950 toll of 15,500.

As 1951 drew to a close, it appeared that the number of traffic accident deaths would be close to 37,500—the largest annual total since 1941. This increase in deaths was apparently matched by the increase in miles travelled by motor vehicles. A meeting of the President's Highway Safety conference was held in Washington in June. Leading points considered by the delegates were adequate accident records and tighter requirements in the issuance of drivers' licences.

Recognition of the seriousness of the farm accident problem was indicated by the fact that, in 1951, 26 states had state farm safety committees and 12 states had a full-time farm safety specialist, working through public and private agencies to spread information on the problem and ways and means of meeting it. The president of the United States, for the eighth successive year, proclaimed a National Farm Safety week, in July 1951, which attracted unprecedented attention to the problem of rural accidents. More than 1,100,000 pieces of educational material were distributed, and radio, newspaper and magazine support was outstanding.

The 1950 toll of deaths in home accidents was 27,500. Reports for the first ten months of 1951 indicated that they were about as many as in 1950.

During 1951 about 85 of the several hundred local and state safety organizations throughout the country qualified for acceptance as chapters of the National Safety council, to represent the National Safety council in the communities in which they worked, although at the same time to retain their autonomy. The 39th National Safety congress was held in Chicago in Oct. 1951, with an attendance of about 12,000. In addition, about 30 regional safety conferences were held during the year.

(R. L. Fo.)

ACHESON, DEAN GOODERHAM, U.S. statesman (b. Middletown, Connecticut, April 11, 1893), attended Groton school and graduated from Yale university in 1915 and from the Harvard law school in 1918. He served in the navy in World War I and was for two years private secretary to Louis Brandeis, associate justice of the Supreme court. He practised law, served for six months as under secretary of the treasury in 1933 and entered the State department in 1941, first as assistant secretary of state and later (Aug. 1945-June 1947) as under secretary. He became secretary on Jan. 21, 1949. Acheson was one of the principal authors of the Truman foreign policy and strongly supported measures for international co-operation such as the North Atlantic alliance. Yet, because he had been high in government counsels during the war and postwar periods when the Soviet Union and international Communism gained greatly, he was the continual target of criticism from foreign policy critics within both political parties. Especially after the entry of Communist China into the Korean war, demands for his resignation grew, and President Harry S. Truman repeatedly issued denials that Acheson would leave his post. The storm about him became hottest after the dismissal on April 11, 1951, of General Douglas MacArthur from his far east posts.

He presided at the San Francisco conference on the Japanese peace treaty Sept. 4-8, signing the treaty on Sept. 8, and his capable handling of the conference won him admiration even from some of his former critics.

ADEN. British colony and protectorates and a free port on the southern coast of Arabia.

Colony. Area: 80 sq.mi. (incl. Perim island [5 sq.mi.], the

strait of Bab el Mandeb and Kuria Muria islands). Pop.: (1946 census) 80,876; (1950 est.) 100,000. Language: Arabic; Indian dialects and Somali also spoken. Religion: Moslem. Administration: governor; executive council, 3 *ex-officio* and 3 nominated members; legislative council, 4 *ex-officio* and up to 12 nominated members.

Protectorates. Western and eastern, the latter including the Hadhramaut and Socotra island. Area, 112,000 sq. mi. Pop. (1950 est.): 800,000. Religion: Moslem. Administration: indirect, by sultans with advice of political officers under British agents. Premier chieftain (western), Fadl Abdul Karim, Sultan of Lahaj; premier chieftain (eastern), Sir Salih bin Ghalib al Qu'aiti, Sultan of Shihr and Mukalla. Governors (1951): Sir Reginald S. Champion and (from Aug. 3) Tom Hickinbothom.

History. A conference held in London in Sept. 1950 with representatives of the Yemen bore fruit early in 1951 in an agreement to establish diplomatic relations and the appointment of a joint commission to demarcate frontiers. Relations between Aden and the Yemen improved greatly in 1951. Nationalist disorders within the protectorate, in which the sultan of Mukalla and the British agent for the western protectorate had been attacked and several rioters killed and wounded in Dec. 1950, did not recur and the year was one of peaceful progress. Excellent progress continued to be made on the Abyan irrigation scheme, under which it was hoped to irrigate about 100,000 ac. of good land, mostly for cotton growing.

Education. Colony, 4,000 primary scholars; protectorate 6,500.

Finance and Trade. Currency: Indian rupee (Rs. 1 = 1s. 6d.); (from Oct. 1951) East African shilling (20s. = £1). Budget (1951 est.): revenue Rs. 14,700,000; expenditure (incl. development) Rs. 20 million. Foreign Trade: imports (1950) Rs. 42 million; exports Rs. 19 million. Trade is mostly entrepôt. Principal exports of local origin: salt (255,865 tons in 1950) and fish (120,000 tons in 1949). In 1950 the port was used by 4,283 ships (tonnage 17,984,884).

(K. G. B.)

See Lord Belhaven, *The Eagle and the Sun* (London, 1951).

ADENAUER, KONRAD, German lawyer and statesman (b. Cologne, Jan. 5, 1876), was educated at the Gymnasium St. Aposteln, Cologne, and at the universities of Freiburg-im-Breisgau, Munich and Bonn. In 1906 he was elected councillor and deputy mayor of Cologne, becoming lord mayor (*Oberbürgermeister*) in 1917. A leading member of the Catholic Centre party, he was a member of the Prussian upper houses from 1917 to 1933 (president from 1928 to 1933). He was dismissed by the nazis from the position of *Oberbürgermeister* in July 1933 and a year later was imprisoned for a short time in a drive against Catholic leaders. He was again imprisoned in 1944 after the attempt on Adolf Hitler's life. The United States occupation authorities made him mayor of Cologne in the spring of 1945, but in October the British, who had taken over the area, dismissed him, forbidding him to take part in politics; however, this prohibition was soon removed. A foundation member of the Christian Democratic union in Sept. 1945, he was president (1948-49) of the parliamentary council of the three western zones which drafted the basic law (constitution) of the German Federal republic; he became chancellor of the republic in Sept. 1949.

Adenauer's chancellorship was marked by the substantial economic recovery of the republic and by renewed German participation in external politics (see GERMANY). He visited Paris in April 1951 and Rome in June. He took the initiative in proposing to the three western occupying powers (Oct. 4) that the United Nations should be asked to appoint a commission to inquire in east and west Germany whether free all-German elections could be held. He again visited Paris (Nov. 20-23) for talks with Dean Acheson, Robert Schuman and Anthony Eden. In visiting London on Dec. 3 Adenauer was the first German chancellor since Heinrich Brüning

(1931) to be received there. He had discussions with Winston Churchill and Anthony Eden and on Dec. 4 addressed members of the House of Lords and the House of Commons under the auspices of the Inter-Parliamentary union; he visited Oxford university, Dec. 5, and met Clement Attlee, leader of the opposition, and leaders of the Liberal party on Dec. 6. Adenauer was received by King George VI at Buckingham palace on Dec. 7 and returned to Bonn on Dec. 8. He paid another visit to Paris, Dec. 28-30, to continue discussions on the European army project. (R. J.A.)

ADULT EDUCATION. Existing facilities for adult education continued to attract growing numbers of students in many countries. On the other hand, there were signs that the unpromising economic situation was having an adverse effect on the development of new facilities. In general, schemes for providing a fundamental education for backward peoples and attempts to bring national movements into closer international contact took precedence over any spectacular new developments in individual countries.

In Jan. 1951 adult educationists from the United States, the Scandinavian countries and India held a weekend conference at Pearson Foundation college (U.S.) to discuss means of tightening the links between adult colleges throughout the world. In September, the Carnegie Endowment for International Peace arranged a round-table conference of leaders in community education in New York and Washington. Its purpose was to begin a study of agencies for international relations, with special reference to the humanitarian aspects of the United Nations' work. In April the director general of U.N.E.S.C.O. spoke in London of his organization's plans for training 4,000-5,000 teachers and specialist field-workers for fundamental education during the following 12 years.

At Cambridge, members of the Colonial Office, the Universities Council for Adult Education and the Cambridge Board of Extra-Mural Studies met in August to discuss adult education in the colonies. The third annual report of the residential college at Burton Manor, Cheshire, recorded in July a growing relationship with industry illustrated by all courses in supervisory management being fully booked to the end of the year, while in Wales the report of the University Extension board showed that 40% of people attending classes were women, with agricultural workers close behind and industrial employees far down the list. A report presented at the conference of the National Institute of Adult Education, held at Oxford, claimed that enrolments in adult classes in England and Wales had risen from 1,165,000 in 1936-37 to 2,362,000 in 1949-50. In September, the well-known series of adult education aids, *Current Affairs* and *Map Review*, ceased publication and their progenitor, the Bureau of Current Affairs, began to wind up. The bureau had made a notable contribution to adult education in popularizing the discussion group.

At the congress of the Educational Institute of Scotland in January it was claimed that adult students were tending to turn from "bread and butter" subjects to literature, philosophy and political theory. In 1951, Glasgow and Edinburgh universities had fully equipped adult education departments and full-time directors of extra-mural studies, while all Scottish universities had extra-mural committees linking universities and local authorities.

The Adult Education Association of the United States held its first annual conference at Los Angeles in October. In Delhi an experimental public library, created by the Indian Government and U.N.E.S.C.O., was opened for the newly literate. It started with 10,000 books, 3,500 of them in Hindi, and would include a mobile unit and Braille and talking books. (H. C. D.; L. WN.)

ADVERTISING. A nine-day International Advertising conference, attended by 2,824 delegates from 38 countries, was held in London from July 7 to July 13, 1951. Before it broke up the conference passed a resolution recording the deep sense of responsibility of all those present "arising from the great development of advertising, the elaboration of its techniques and the widened scope of its functions in modern society." A formal declaration was then made on the use of advertising in the promotion of world trade and international understanding, and on the ethics of advertising and the standard of character and training of those engaged in it. The conference was opened by the Duke of Gloucester, and Lord Mackintosh of Halifax presided. It was the biggest international advertising gathering so far held and was also the largest international business or professional conference to be held in Britain since World War II.

Expenditure on press advertising continued to mount. The *Statistical Review* calculated that the value of space (excluding classified advertising) bought in publications of all kinds (newspapers, magazines and trade and specialized periodicals) in 1950 amounted to £36,913,899. This was 20.94% higher than the figure for 1949, when the same authority put the total at £30,522,199. For the first six months of 1951 the *Statistical Review* estimated the expenditure at £19,814,356, as against £18,441,862 in the same period of 1950. These increases were largely accounted for by the higher advertisement rates which publications of all classes were constrained to charge to cover themselves against the rising costs of paper and printing.

The government made further cuts in its advertising programme. Civil estimates published in March 1951 provided for the expenditure of £671,650 (as against £911,000 in 1950-51) on press advertising through the Central Office of Information in 1951-52. Poster-advertising expenditure was to be reduced from £253,000 to £173,500 and the outlay on films decreased from £497,500 to £313,840. A white paper issued in June 1951 noted that home information expenditure would be cut from £4,157,800 (1950-51) to £3,411,200 (1951-52) while the outlay on overseas information expenditure would be brought down from £10,821,950 to £10,184,000.

The report of the broadcasting committee under Lord Beveridge, published in Jan. 1951, recommended, among other things, that advertising should not be permitted from British radio and television stations, although Lord Beveridge himself, and two other committee members, expressed the view that publicity material, suitably controlled, should be

allowed. Nevertheless British radio listeners continued to receive sponsored programmes broadcast to them from Luxembourg, which on July 2 opened up a powerful new transmitter, beamed to Great Britain and transmitting nightly programmes in English paid for by British advertising interests.

In the field of outdoor advertising manufacturers and users of electrical signs, as well as those shopkeepers who relied on the advertising value of illuminated window displays, noted the assurance of the Ministry of Fuel and Power that the absolute ban on the use of power for these purposes, re-introduced in the winter of 1950-51, would not be imposed again. Instead limited restrictions, to be applied during the "peak" hours of electricity consumption, were announced for 1951-52.

A plan to discover, by research and inquiry, how cinema audiences reacted to advertising on the screen was announced by a large firm engaged in this type of advertising. Co-operation in this investigation was promised by the Institute of Incorporated Practitioners in Advertising and the Incorporated Society of British Advertisers.

In July a novel advertising campaign was launched to explain the merits of free enterprise. Using large spaces in the press it was backed by the Institute of Directors. In the first year it was planned to spend £200,000 on this scheme, designed to show that "Free Enterprise gives everyone a chance and a choice."

The death of Sir William Crawford in Nov. 1950 brought to a close a distinguished career in advertising. He was a notable pioneer in the advertising agency field and, as vice chairman of the Post Office Publicity committee, was responsible for the introduction of the special greetings telegrams.

Commonwealth. Questions were asked in the Australian federal parliament following the revelation that the London *Daily Mirror* had acquired the biggest network of commercial broadcasting stations in Australia, including 2GB, Sydney. Between 60 and 70 transmitters were involved in the transaction. All the stations derived their revenue from the sale of time for advertising purposes and were said to reach 92% of the Australian radio audience.

South African growers launched a campaign, to cost £60,000, advertising the union's citrus fruits in Great Britain.

Europe. The Association of Advertisers in Ireland was formed in Dublin with the support of many of the biggest advertisers in the country. It aimed to protect the interests of advertisers, as opposed to the owners of advertisement media and advertising agencies, and would co-operate with

The Festival of Britain influenced the design of many of the posters displayed in 1951. This advertisement was erected near the South Bank exhibition in London.

similar organizations already established in other countries. A meeting of the advertising group of the International Chamber of Commerce was held during the I.C.C.'s 13th biennial congress which took place in Lisbon. It was reported that the I.C.C.'s *Code of Standards of Advertising Practice* had been officially adopted by 51 advertising and other organizations in 12 different countries. The European Society for Opinion Surveys and Market Research and the World Association for Public Opinion Research held a conference at Tunbridge Wells, England, the arrangements for this meeting being in the hands of the Market Research Society of Britain. Some 100 delegates from 12 countries attended and discussion covered the role of modern opinion and fact-finding research methods in advertising.

(A. J. Hy.)

United States. The volume of advertising bought in the United States in 1951 was estimated by Robert Coen, McCann-Erickson Inc., to be about \$6,300 million, an increase of 12% over 1950. Especial vigour was shown by television, magazines and direct mail as advertising media. Advertising charges continued to rise, but not with the speed of other costs; while the bureau of labour statistics wholesale price index had risen 65% since the end of World War II, it was estimated that the cost of advertising had risen only 23%.

Television. Television continued to show rapid growth, sets in use by the public on Jan. 1, 1952, being estimated at 14,500,000 with 108 stations covering 63 major market areas with 60 hours a week of regular programmes. It was estimated that 29% of U.S. families had television sets by Oct. 1951. The Publishers Information bureau reported that television time charges on the four major networks were \$114 million for the first 11 months of 1951. The Columbia Broadcasting system estimated that all television time, talent and other costs amounted to about \$355 million in the year. Basic hourly rates were increased during December; a station in New York city was expected to raise its hourly night-time price from \$4,000 to between \$4,500 and \$4,700. Talent-production costs went as high as \$40,000 for an hour's programme.

The National Association of Radio and Television Broadcasters announced that a code of practices for television would become effective on March 1, 1952, and that a national review board would be established to investigate complaints against television stations. Nearly half the code was devoted to advertising. It stated that messages were to be presented with courtesy and good taste, that liquor advertising should be rejected, and wine and beer accepted only in compliance with local law. Contests and premium offers should be carefully supervised.

Radio. Radio continued to grow during 1951, the number of homes with radio sets at the beginning of 1952 standing at 42,700,000, a gain of 800,000 during the year. However, in 1951 the total hours of radio usage in the home were 14% below the 1949 level, according to data supplied by A. C. Nielsen company.

In order to meet the competition of advertising on television, radio stations reduced their rates and resorted to other expedients. The Columbia Broadcasting system cut its night-time network rates by about 10% in the spring, and the other networks followed. Advertisers were also given more latitude in buying time on network stations. The National Broadcasting company revised its line-up of stations so that an advertiser was permitted to choose stations based upon the number of homes they reached, rather than upon the old basis of minimum groups designed by the network. Columbia Broadcasting system offered to sell advertisers a piece of a particular show; the advertiser could buy the show in whatever markets he chose and in the weeks he selected.

A poster by Reginald Mount which was used in the "Keep Britain Tidy" campaign during 1951.

A number of important advertisers returned to radio after an experience in television, and there was considerable interest by advertisers in morning radio programmes. It was also realized that the mere purchase of a television set did not mean that radios were thrown out, as more families were buying extra radio sets; while there were 42,700,000 homes with radios, there was a total of 105,700,000 sets in use. The Columbia Broadcasting system reported that advertising expenditures on the four major networks were \$145,745,097 for the first ten months of 1951, a 4.1% drop from 1950.

Newspapers. An estimate by Media Records based upon newspaper advertising in 52 cities showed that total advertising linage was 1.9% higher during the first 11 months of 1951 than for the same period of 1950. The volume of all newspaper advertising in 1950 was more than \$2,000 million. National advertising linage was down 5.7%, declines being noted in both the general and automotive classifications. Local (retail) advertising showed no change from its 1950 volume. Classified advertising linage increased 14.3%, however, saving the total newspaper advertising figure from a loss. Declines in national newspaper advertising were found in most classifications, laundry soaps and cleansers and alcoholic beverages being the most important classifications revealing gains. Advertising of new passenger cars and of groceries was off. It was estimated the dollar volume of national newspaper advertising would be close to the 1950 figure of \$499 million, the drop in linage being offset by increases in rates.

Magazines. The volume of advertising in magazines was estimated by the Magazine Advertising bureau to be \$508

An example of three-dimensional advertising on a bombed site in Piccadilly, London.

million for 1951, an increase of about 11% over 1950. The 11-months' total for magazine advertising (Jan.-Nov.), \$469 million, was the highest on record. The circulation of magazines was also at a record level. The average circulation of all magazines who were members of the Audit Bureau of Circulations (excluding comics) was 150,638,004 copies an issue during the first six months of 1951, an increase of 2.7% over the 147,300,000 for 1950. This represented a circulation per 100 persons of 98.5.

Magazine advertising costs on a page-per-thousand basis increased about 3% for the first six months of 1951 over the preceding year, for both black-and-white and four-colour advertising. During 1951 many magazines announced rate increases and it appeared that magazine advertising costs in 1952 would be about 6% higher than those for the first six months of 1951 and about 12% higher than prior to World War II.

Other Media. The dollar volume of direct mail advertising during the first 10 months of 1951 was \$879 million, a gain of 14.5% over the corresponding period of 1950 according to an estimate by the Direct Mail Advertising association. An estimate by Outdoor Advertising, Inc., put the national volume of outdoor advertising in 1951 at \$90 million, a gain of 4.5% over 1950. There was still a shortage of outdoor advertising space and it was difficult to secure stainless steel for outdoor panels because of war demands. (R. A. BN.)

AFGHANISTAN. Independent kingdom in the centre of Asia bounded N. by the U.S.S.R., W. by Persia, S. and S.E. by Pakistan and E. by China (Sinkiang). Area: c. 270,000 sq.mi. Pop. (1947 est.): 12 million. Races: Afghans or Pathans or Pashtuns 53%, Tajiks 36%, others 11%. Language: Pashtu or Pakhtu, some Persian. Religion: Moslem (Afghans are Sunni, others mainly Shia). Chief towns (pop. 1950 est.): Kabul (cap., 206,000); Herat (85,000); Kandahar (77,000); Mazar-i-Sharif (55,000). King, Mohammed Zahir Shah; prime minister (from May 1946), Shah Mahmud Khan, the king's uncle.

History. As in the previous year, relations between Afghanistan and Pakistan were not happy in 1951, owing to charges and countercharges regarding border incidents and, on the Pakistan side, particularly because of the alleged encouragement by Afghanistan of the so-called "Pashtunistan" movement (see *Britannica Book of the Year 1951*).

Under the Four-Point programme, an agreement with the United States was signed in Kabul in February to assist the Afghan government in the economic development of the

country. In May a high official of the Pakistan government, Colonel A. S. B. Shah, who had been counsellor to the British embassy in Kabul in 1944 and was regarded as particularly acceptable to Afghans, visited Kabul for private talks, and it was hoped that in due course Afghan relations with Pakistan would improve. With India the Afghan government maintained, through the year, a cordial relationship of which an indication was given by the visit of the prime minister, Shah Mahmud Khan, to Delhi in January.

The assassination of Liaquat Ali Khan called forth from Kabul a sympathetic message and a tribute to the ability of the dead statesman. The Pakistan government on their side were careful to stress the point that, although the assassin was stated to be of Afghan origin, there was no sinister significance in that fact, especially as he had been an exile in Pakistan for some time.

On Sept. 5, the Afghan prime minister, who was paying yet another visit to Delhi, was invited to address members of the Indian parliament and he reaffirmed his hope that the close and sincere relations already existing between Afghanistan and India would remain for the benefit of world peace. He indicated that the policy of his government was to improve commercial relations with other countries and particularly to develop trade with India. At a state banquet at which Jawaharlal Nehru presided, the two prime ministers exchanged more cordial greetings. At a subsequent press conference Shah Mahmud Khan stressed the friendliness of Afghan policy towards Pakistan, but maintained that in supporting the "Pashtunistan" movement, Afghanistan was not animated by hostility to Pakistan. (E. Hd.)

Education. Schools (1948): primary 400, secondary 25, higher 7; teachers' training colleges 2. University at Kabul with four faculties.

Agriculture. Main food crops: wheat, barley, rice, millet, maize and fruit. Production ('000 metric tons): cotton (1949) 4; sugar beet (1950) 33; wool (1950) 8. Livestock ('000 head, Jan. 1948): cattle 3,000; sheep 14,000; goats 6,000; camels 350; horses 500; asses 1,000; poultry 40,030.

Industry. Fuel and power: coal (1950) 7,100 metric tons. Raw materials (1949): chrome ore 907 metric tons; salt 10,373 metric tons; skins and hides (number) 7,250,000.

Foreign Trade. Principal imports: textiles, sugar, china, petrol (1949: 4.5 million gal.), cement (1949: 18,100 metric tons), machinery, tea, coffee and cocoa. Principal exports: karakul skins (1950: \$26 million), carpets, cotton, raw wool, spices and fruit.

Communications. Roads (1949) 2,265 mi. Licensed motor vehicles (Dec. 1950): cars 975; commercial 3,735. Telephone subscribers (Jan. 1949): 3,899. Radio receiving sets (1949): 4,800.

Finance and Banking. Note circulation (million afghans, March 20, 1949; March 20, 1950, in brackets): 955 (845). Monetary unit: *afghani*, with an exchange rate (Nov. 1951) of £1 = Af. 47.38.

AGRICULTURE. During the first quarter of 1951 the demand for farm products continued to increase rapidly. In North America, rearmament necessitated a rapid building up of strategic reserves of wool and other raw materials, and of foodstuffs. The fear of "burdensome surpluses" of foodstuffs that had prevailed before the outbreak of the Korean war gave way to concern about shortages. By the end of Jan. 1951, prices received by farmers in the United States were already 26% higher than in June 1950, and retail prices of food were 12% higher. In an attempt to control inflation, internal prices and wage rates were fixed at the levels they had attained on Jan. 25. Apart from beef, veal and lamb, however, most important foodstuffs were exempt from control because, on official calculations, their prices were still below parity with the prices that farmers paid for goods and services purchased. Imports of agricultural products to North America from overseas were increased and much higher prices paid for them. During the year ended June 1951, as compared with the previous year, the U.S. imported 9% more rubber, 30% more wool, 2% more cocoa, 10% more coffee and 15% more sugar. In dollar value the increases were 184%, 140%, 62%, 58% and 19%

respectively. Before June, however, the rapid price advances had ceased and some substantial downward adjustments were made in wool and rubber prices. During the remainder of the year general price movements in dollar markets were less significant.

High prices for wool, rubber and cocoa tended to raise the dollar earnings of the sterling area as a whole, particularly during the early part of the year, but the concurrently high prices for wheat, feedingstuffs and other imports, aggravated balance-of-payment problems in the United Kingdom and western continental Europe. High prices for feedingstuffs, partly due to the poor harvests of 1950 in Argentina, made conditions particularly difficult for the U.K., Denmark and the Netherlands, where maintenance of recent rates of increase in livestock populations was largely dependent on imported feedingstuffs. The U.K. was, moreover, faced with an upward adjustment of long-term contract prices for food imports. These prices had been kept relatively low on the grounds that the contract arrangements gave promise of greater long-run stability. But increases in general price levels following the outbreak of hostilities in Korea finally made upward adjustment imperative. After many months of negotiation agreement was reached in April 1951 to pay much higher prices for meat to Argentina. In October a 15-yr. agreement with Australia also provided for large price increases for meat. For dairy produce Australian producers were not satisfied with the maximum price increase of 7.5% in any one year, as originally agreed with the U.K., and both New Zealand and Denmark were in serious difficulties because the prices of their exports were low compared with those of their imports. The bargaining position of the U.K. on dairy produce was further undermined by the ending

of butter rationing in Australia, New Zealand and Denmark late in 1950, and by the decision of the Canadian government at the beginning of Jan. 1950 to discontinue the subsidization of exports of foodstuffs to the U.K.

The United Kingdom was moreover attempting during the second half of 1951 to rebuild stocks of foodstuffs that had been reduced during the period of rising prices of the previous 12 months. During the financial year 1951-52 it was intended to spend some £71 million on war-emergency stocks of foodstuffs.

Livestock Production of 1950-51. The 1950 European harvest of coarse grains, so badly needed for livestock, was 2.4 million tons less than in 1949, and 7.6 million tons less than in the late 1930s. Crops in the Danubian countries were especially small. Western and southwestern districts of Great Britain were also seriously affected. In North America the harvest was as great as in 1949, but it was again poor in Argentina, and international trade in feedgrains continued at a low level.

Shortage of feedingstuffs in Europe resulted in a marked reduction in the rate of increase of livestock production. Milk production during the first half of 1951 was significantly lower than in the same period of 1950 in the United Kingdom, Denmark and the Netherlands. By Sept. 1950, in England and Wales, the total number of cattle was 2% less and the number of calves 9% less than in Sept. 1950. The marked rise in the pig numbers gave cause for anxiety about the sufficiency of feedingstuffs for them. In the Netherlands the number of breeding sows was reduced by 10%.

In Argentina the effects of droughts in 1949 and earlier price-fixing became apparent in the sharply reduced flow of cattle to slaughter.

The sheep fair which was held at Findon on the South Downs in Sept. 1951.

TABLE I. POPULATION, AGRICULTURAL PRODUCTION AND TRADE, AND AVAILABLE SUPPLIES OF FOOD CROPS, 1950-51

	Population (1936 = 100)	Production (1934-38 = 100)	Exports (1934-38 = 100)	Imports (1934-38 = 100)	Supplies†

SOURCE: F.A.O. *Monthly Bulletin of Statistics* July-Aug. 1951.

Harvests of 1951. The area sown to wheat and rye in western Europe for harvest during 1951 was some 2% smaller than that sown for harvest in 1950, and yields were lower. Wheat production was some 2 million metric tons (7%) less than in 1950 and rye production some 0.4 million metric tons (6%) less.

In eastern Europe bread grain harvests were substantially larger than in 1950. In Yugoslavia, where drought conditions in 1950 were unusually severe, wheat production in 1951 was greater by over 0.5 million metric tons (29%).

In North America, the wheat crop of the United States was slightly smaller than that of 1950 but still almost 8 million metric tons greater than the average of the years 1934 to 1938. Canada had a bumper crop, 3.3 million tons greater (and of better quality) than that of 1950 and 8.7 million tons greater than the prewar average.

In Australia, the acreage sown to wheat was again reduced and there were fears that the exportable surplus from the 1951 crop would fall below the amount under the International Wheat agreement. Argentina's wheat acreage was also reduced.

In India, the monsoon was a partial failure and severe drought damage was done to crops in the west and south. The need for a further increase in imports of food grains in 1952 seemed inevitable. Despite prospective reductions in supplies from the U.S., Australia and Argentina, and India's greater needs, the world bread-grain position was, in general, somewhat improved. In western Europe, however, additional purchases of "dollar" wheat or of wheat from eastern Europe became necessary.

The coarse-grain crops, barley and oats, as estimated in September, were some 0.6 million metric tons greater in western Europe in 1951 than in 1950. The maize crop was also somewhat greater, and, in eastern Europe, very much greater. On the other hand, in the U.K., where the spring came late and sowing conditions were difficult, production of barley and oats were down by some 0.3 million tons.

In North America, barley and oat production was up by 3 million tons in Canada but down by 2.1 million tons in the U.S. where the maize crop also seemed likely to yield less. The Argentine maize crop harvested during the first part of the year was expected to provide an exportable surplus of some 0.5 million to 1.5 million metric tons as against average exports of 6.5 million tons a year during the late 1930s. But little maize was in fact shipped during 1951, and no substantial additional acreages were sown for harvest in 1952.

Potato and sugar beet crops suffered from variable weather conditions. In the U.K. the potato acreage was reduced by 15% between 1950 and 1951 and yields fell by some 4%. Wet conditions in late summer and autumn provided plenty of grazing in northwestern Europe and, generally, supplies of hay were adequate though of low quality.

Marketing and International Trade in Farm Products. Countries that had negotiated tariff reductions at Geneva (1947) and Annecy (1949) agreed at a conference at Torquay, England, to renew practically all existing concessions for a

three-year period up to Jan. 1, 1954. But the fears of agricultural surpluses in the U.S. that had grown up before the war in Korea were still evident in the Torquay negotiations.

The O.E.E.C. continued their commodity studies with a view to the liberalization of trade but the United Kingdom opposed the plan of Pierre Pflimlin, French minister of agriculture, preferring inter-government agreements rather than any supranational commodity commissions.

Arrangements for the marketing of cotton in Uganda, and cocoa and oilseeds in Nigeria and the Gold Coast were further developed, but strong opposition was raised to a proposal to establish a fund for the stabilization of rubber prices.

Scientific Research. Much attention continued to be devoted to grassland and grazing problems, particularly in the British Isles and western Europe. Growth inhibitors and plant toxins were further developed. Systemic insecticides were actively studied and some appeared to be particularly useful. Further progress was made in the study of trace elements (especially molybdenum), phosphate deficiencies in farm animals, various types of fowl pest, venereal infertility in cattle, and mastitis, and in many other chemical, biological and veterinary fields. Considerable progress was also made in tropical problems such as cattle management in Uganda and lime die-back disease in the Gold Coast. A secretary for agricultural and forestry research took up his appointment in the office of the secretary of the West African council in Feb. 1951.

In California, Great Britain and the Netherlands, the efficiency of fresh-water algae in photosynthesis was shown to be exceptionally high; this gave some promise of a useful food production technique for emergency conditions.

United Kingdom. In the face of the growing difficulty of securing cheap imported foodstuffs, the agricultural policy of the United Kingdom was to continue the programme of expanding home production, which had been announced in Aug. 1947. The objectives discussed by the farmers' leaders and the government in Feb. and March 1951 included (a) continuation until 1954-55 of the programme for increasing meat production, and (b) confirmation that the national requirement of barley, oats and mixed corn for animal feeding was "virtually unlimited." On the other hand, the government wished to stabilize the output of milk, eggs, wheat and sugar beet at about current levels and to reduce slightly the acreage of potatoes. The fixed prices for livestock guaranteed for the year ending April 1952 and for crops of the 1952 harvest reflected this production policy to some degree, and indicated the government's desire somewhat to reduce farming profits, which, in 1950-51, were about five times greater than in 1937-38.

Later in the year the census figures for England and Wales showed a reduction in the acreage of grain between 1950 and 1951 of 430,000 ac. This was partly due to weather conditions in the autumn of 1950 and spring of 1951, but, together with continuing difficulties in securing imports of feedingstuffs, it led the minister of agriculture in Sept. 1951 to inaugurate a campaign with the slogan "Plough more—Feed more." Despite the risk of grain losses at harvest-time, western areas of the country would, it was hoped, increase feed grain acreages.

The difficult upland areas were also expected to produce more. The Livestock Rearing act was passed in March with the object of further encouraging cattle and sheep breeding and rearing. It provided for grants to owners and tenants who carried out approved schemes of upland farm improvement. A total subsidy of £22 million might be paid out by the end of 1956.

Throughout the year, in the United Kingdom as elsewhere in western Europe, the prices of goods and services bought

This mechanically-operated elevator was used for stacking hay on a farm at Broughton, Hampshire, in June 1951, when there were generally good crops.

by farmers tended to rise. In October the Agricultural Wages Board of England and Wales decided on further increases in wage rates amounting in all to some £20 million a year. A special review of farm produce prices in the U.K. was therefore undertaken during November.

Western Europe. Elsewhere in western Europe no such automatic adjustments were made and farmers in many localities faced much uncertainty. In March the council of ministers of the Organization for European Economic Co-operation approved a report on agricultural production calling for a more rapid increase in output especially in 1951 and 1952. It showed that the food output of O.E.E.C. countries as a group was still only 8% to 10% greater than in prewar years although the human population was 11% greater. This report was also considered by the European economic recovery committee of the International Federation of Agricultural Producers in Paris in April, and governments were later advised to ensure that farmers had adequate finance and supplies of requisites to undertake further expansion, and to ensure also that they felt little risk in doing so. It was clear, however, that any increase in livestock numbers was subject to uncertainties about feedingstuff supplies, and expansion of crop production might sooner or later be limited by shortages of fertilizers (particularly nitrogenous fertilizers and superphosphates requiring sulphuric acid in their production), of chemicals for pesticides and of farm machinery. Defence programmes would also result in some withdrawal of labour from farms.

On the other hand, progress could be made in certain directions. The development of machinery suited to small farms continued and the desirability of extending successful co-operative organization to provide machine services was widely recognized. Revision of taxes on tractor fuels, tractors and implements and improvements in credit facilities were proposed. Further progress was made in trials of many maize hybrids and in selection of types of maize suited to various local conditions. Improvements in grassland management and conservation of grass continued. Control of Colorado beetles was made more effective, though the infestation was severe and tended to spread in Western Germany. Future supplies of potash fertilizers for western Europe as a whole became better assured through the discovery of large deposits of potassium chloride in Yorkshire, England. In Italy some progress was made in carrying out the land reform law passed in Oct. 1950. This provided for

the expropriation of 600,000 ha. and about one-sixth of this was reported to have been brought under the control of regional boards by Sept. 1951.

Eastern Europe. The acceleration of the collectivization of holdings, begun in 1950, continued in 1951. In Bulgaria, 70% of peasant holdings were to be collectivized before the end of the year. The corresponding figure for 1948 was only 6.7%. Opposition to collectivization was active. In the U.S.S.R. the extent to which collective farms had been merged during 1950 was reported: the total number of collective farms was reduced from 252,000 to 123,000. This implied a new pattern of labour organization and strike control. A failure of livestock production plans was also reported.

In Yugoslavia, on the other hand, no substantial number of new collective or state farms was organized and attention was devoted entirely to improving the efficiency of existing units within the socialized sector of agriculture, which was heavily subsidized. A revival of co-operative societies of the prewar type received a measure of encouragement from the federal government and some of the republican governments. But, despite foreign aid, rapid inflation increased the difficulties of securing steady agricultural progress through wise capital investment and production and marketing organization.

Commonwealth. Realization of the need to give greater priority to agricultural development became more evident in Australia. The population was increasing at the rate

of 3% a year but food production was rising at less than half this rate. Shortages of rural labour were further accentuated by industrial development schemes and the defence programme. Some distortion of normal agricultural output also resulted from the high prices of wool; in March 1951 wool prices were more than four times as high as they were in early 1950. Fears were expressed that, should Australia's population increase by 1960 to nearly 11 million, exports of meat and dairy produce would have to be greatly reduced. Rapid advances in retail prices of foods served to call general attention to these basic changes. Consideration was given to securing more superphosphate and sulphur-bearing materials for its production, more and better grass and fodder conservation, more intensive use of pastures, further improvements of the cattle routes from the Northern Territory to Queensland, increased mechanization and better conservation of soil, water and natural vegetation. Canada, too, with rising population and rapid development of mining and industry, had a clear indication of how well its expanding home market could absorb most of the output of its farms, apart from wheat.

The draft outline of India's first five-year plan, published in July 1951, indicated that it would direct the major effort to agriculture, and in particular to irrigation. The previous objective of self-sufficiency by 1952 was abandoned and instead an annual import of some 3 million tons of grain was recommended. Co-operative farming and the radical changes in land tenure which it would require were advocated. Operations were under way on three large river-valley projects, those of the Damodar, the Bhakra Nangal and the Kirakuddams. Eight other valley projects were under investigation.

These and other Indian projects were included in the Colombo plan (*q.v.*) for co-operative economic development in southeast Asia, which was officially inaugurated on July 1. Pakistan's plans included water control and irrigation projects for 6 million acres of land, and schemes for the distribution of improved seeds, fertilizers and farm machinery.

Ceylon planned to complete a £25 million river-control scheme to irrigate 130,000 ac. and provide 21,000 peasant holdings, and to undertake other schemes of this type. Malaya, Singapore, North Borneo and Sarawak would together spend some £13 million directly on agricultural projects—out of a total of £107 million. Contributions of capital were to be made by the United Kingdom, Australia and Canada, and by the United States. The high prices of primary products also facilitated finance by the Asian countries themselves. Greater difficulties seemed likely to arise in trying to secure enough trained men, and (because of rearmament) certain capital goods.

Argentina. The desire of the Argentine government to strengthen agriculture and to export more farm produce was intensified by the growing need to earn more foreign currency. Serious drought in 1949-50, the fixing during the protracted trade negotiations with the United Kingdom during 1950 of cattle prices that induced the slaughter of too many young cattle and the low yields of cereal crops in 1949-50 and

Spectators watching a competitor in the British national tractor ploughing championships held in Nov. 1951 near Tadcaster, Yorkshire.

1950-51 all aggravated the effects of the general postwar policy of industrialization which led to reduced cereal acreages and restricted livestock numbers. The agreement to export 200,000 tons of carcass meat to the U.K., which was reached in April 1951, seemed unlikely to be fulfilled for lack of supplies, but the change in Argentine policy was significant for the future. (J. R. RA.)

United States. Crops. In spite of bad weather U.S. crops in 1951 were the third largest on record, exceeded only in 1948 and 1949. The total volume of all U.S. 1951 crops increased to 139% of the 1935-39 base as compared with 134% in 1950, but was nevertheless well below the 152% of 1948 and the 147% of 1949. Food grains declined moderately to an index of 144 as compared with 148 in 1950.

The 52 principal crops for 1951 were planted or growing on a total of 362,207,000 ac. But acreage losses prior to harvest were the largest since 1936, amounting to 26,390,000 ac., and the 335,817,000 ac. harvested were 647,000 ac. less than in 1950 and less than any year since 1941.

Yields per acre were relatively high, giving a composite-yield all-crop index of 143, the same as in 1950 and exceeded only in 1948. New high yields were set for all hay, tobacco, hops, dry beans and sugar beet. Spring wheat, oats, rye, cotton and several of the legume seeds exceeded 1950 but were not new records. The harvest in 1951 included 146,500,000 tons of the eight major grains, exceeded in several years but more than in any year prior to 1942. The tobacco crop was the second largest and the fourth to exceed 2,000 million lb.

The U.S. Department of Agriculture late in 1951 called for an enlargement of 1952 planted acreage by about 3 million ac. total, with about 7 million ac. more for feed crops.

TABLE IV. U.S. CROP PRODUCTION AND YIELD

Livestock. Abundant livestock production in 1951 filled some gaps left by lower crop production. Farmers and ranchers in the U.S. increased their cattle herds further during 1951, holding 84,179,000 head at the beginning of the year, as compared with 80,052,000 a year earlier. It was forecast that cattle on farms and ranches at the beginning of 1952 might exceed 90 million head. Meanwhile, during a hectic year of price controls and high cattle prices, enough animals came to market to provide 9,000 million lb. of beef, about 800 million lb. less than had been forecast for the year and 580 million lb. less than in 1950. The average price paid to farmers for beef cattle in Dec. 1951 was \$27.50 a hundredweight, compared with \$25.40 a year earlier.

Of the total cattle, 24,579,000 were classed as milk cows and heifers, a figure which had changed only slightly in late years, of which about 22,700,000 were milk cows. And, as in late years, those cows produced milk at a level approximating 120,000 million lb. for the year, and perhaps a new record of more than 5,292 lb. a cow.

There were 65,028,000 pigs on farms at the beginning of the year and a pig crop of 105,818,000 during the year. About 86 million head were slaughtered during the year, yielding about 11,800 million lb. of pork.

In spite of the high price for lamb and mutton, sheep numbers on farms made a 4% recovery from record low numbers; the 31,505,000 on farms on Jan. 1, 1951, probably increased further during the year and meanwhile 515 million lb. of lamb and mutton were produced, with 600 million lb. forecast for 1952. Lambs at \$28.50 a hundredweight in Dec. 1951 were higher than the \$27.60 a year earlier.

Total production of wool in the U.S. in 1951 was about 260 million lb. (greasy basis). Imports of wool for clothes for consumption amounted to 325 million lb. during the first eight months of 1951; in 1950, carpet wool in an amount of 315 million lb. was imported. In the latter part of the year consumption was declining. The gyrations of wool prices during the year were very rapid and extreme, but U.S. farmers in Dec. 1951 were receiving 62.7 cents a pound against 82.8 cents a pound a year earlier.

Poultry played a very significant part in supplying the meat demand of 1951. Approximately 703 million farm chickens, a production of broiler chickens as much as 25% to 30% more than the 616 million of 1950, and about 53 million turkeys contributed about 35 lb. of food a head during the year, much more than the total for veal, lamb and fish. Prices were rather low, and storage stocks very large.

Food Stocks and Exports. In spite of generally good crops, supplies of some of the major and minor agricultural commodities declined during 1951. This was especially the case as to the very storable bread grains and feed grains, but almost as true of butter, cheese and dried milk.

U.S. exports of farm products in 1950-51 accounted for 27% of the nation's total exports and amounted to a value of \$3,409,245,000, about 14% more than in the previous year. Exports of cotton (\$935,332,000), wheat (\$747,570,000) and tobacco (\$273,262,000) accounted for 57% of the farm products, by value.

Prices and Farm Income. The price effects of inflation and inventory accumulation of the latter half of 1950 carried over strongly into early 1951, so that, in spite of comparative abundance of most agricultural products, in mid-Feb. 1951 farm prices stood at record levels, 313% of the 1910-14 level and 32% higher than a year before, about 26.5% higher than when the fighting started in Korea and 2% higher than the previous record in Jan. 1948. Higher prices for meat animals were in considerable part responsible for the strong upturn, though soybeans, cotton, cottonseed, rice and wool, as well as beef cattle, veal calves, sheep and lambs, were at or above probable legal minimum ceiling levels.

Then demand moderated somewhat and favourable prospects began to affect the situation. Prices declined until September to a level 291% of the 1910-14 average, then turned up again, ending the year at 305% of the average, 19 points, or nearly 7%, above the previous December.

Estimated gross farm income, including home consumed produce, for 1951 was \$37,500 million, 14% higher than in 1950. Of the net increase of \$37,500 million, 2% was credited to larger volume of marketings and 12% to higher average prices. Receipts from livestock and livestock products were estimated at \$19,500 million, 20% higher than in 1950, whereas the estimated total for crops of \$13,300 million was only 6% larger than in the previous year. Agricultural

production expenses also increased from a record \$20,000 million in 1950 to \$22,500 million in 1951.

Population and Farms and Farm Labour. Not nearly all the agricultural information to be derived from the 1950 census was yet available in 1951. But the trend toward fewer, larger and better-equipped farms was confirmed. Farms decreased by 713,000 as compared with 1940, from 6,097,000 to 5,384,000; the average-size farm unit grew from 174 ac. to 210.5 ac.

Agricultural employment in 1951 was estimated at about 400,000 less than in 1950, partly because of increased mechanization of farming but even more because of the strong drawing power of defence industries. Total farm employment included in late Sept. 1951 (the normal peak period of farm employment) 13,352,000 persons.

Wage rates, frozen early in the year, were somewhat relaxed under an order permitting up to a 10% increase without special authorization, but nevertheless averaged only about 66 cents an hour cash wages on Oct. 1, about 12% more than a year earlier. From Jan. 1951, regular hired farm workers were covered under the old age and survivors' insurance programme of the Social Security act as amended in 1950. K. R.)

AIRCRAFT MANUFACTURE. As a result of the armament drive, British manufacturers during 1951 were concentrating their efforts mainly upon military types of aircraft; aero-engine constructors were thus hard put to it to fulfil the need for power plants for the Royal Air Force, with the result that the output of civil transport types lagged.

The annual exhibition of the Society of British Aircraft Constructors, at Farnborough, in September, reflected the preponderance of military construction. The show included two four-jet bombers, the Vickers Valiant and the Short SA.4, and two new single-seater interceptor fighters, the Hawker P.1067 and the Vickers-Supermarine Swift, all powered by Rolls-Royce Avons. On the other hand, the civil transports exhibited had all been shown previously. Of the Vickers Valiant, the secretary of state for air, introducing the estimates for 1951-52, stated that it would be faster and have a greater load and range than the twin-jet Canberra bomber, then being mass produced in the United States under the designation B-57, with Armstrong-Siddeley Sapphire engines (first demonstrated at Farnborough in 1950) in place of the Avons which were being fitted in all R.A.F. versions of the type, which included a tactical bomber and a high-altitude reconnaissance aircraft. The Short SA.4, first flown on Aug. 10, presented original features in the installation of its Avon engines, in each pair of which one engine was mounted above the other.

The Hawker P.1067 fighter, somewhat similar in appearance to its predecessors the P.1040 and P.1052, was claimed to have a better performance than the Russian MIG-15 or the latest U.S. fighter. Its cousin, the Sea Hawk, adopted as the standard naval fighter and powered by a Rolls-Royce Nene engine, was given increased endurance by the provision of wing tanks of 180 gal. capacity.

The Swift, developed from the Supermarine 535 and first demonstrated at the 1950 Farnborough show, was accepted by the R.A.F. It had the swept-back wings first seen in the Type 510, and was powered by Rolls-Royce Avon. Meanwhile, the Attacker, an interim deck-landing fighter for the Royal Navy, was being delivered in quantity to the service.

Among civil transport aircraft, the De Havilland Comet, with Ghost engines, carried out a considerable amount of

development flying on the British Overseas Airways corporation routes during the year. At an all-up weight of 105,000 lb., it had a cruising speed of 490 m.p.h. at 35,000 ft. and a still air range of 3,000 mi. In addition to those earmarked for B.O.A.C., orders were received from Canada and France. The Avon-powered series II Comets seemed likely to show much improved performance.

Two interesting new aero-engines were removed from the secret list during the year. The Napier Nomad was a composite, combining a turbine and a piston, connected to drive an airscrew and giving very low fuel consumption. The Bristol Olympus, a large turbo-jet for which an important future in both military and civil aviation was forecast, was Bristol's first venture in the pure jet field. A licensing agreement was made between Bristols and the Curtiss-Wright corporation for building this engine in the United States.

In January, it was announced that the Bristol Brabazon would not be put into production as an airliner. The second prototype ordered by the Ministry of Supply would be completed and used for experimental flying, though it might ultimately have uses as a military transport. The total cost of the Brabazons, including the consequent aerodrome development at Filton, Bristol, would amount to about £12 million. Meanwhile, work continued on three 140-ton Saunders-Roe Princess flying boats powered, like the Brabazon II, with Bristol Proteus air-screw turbines. Originally intended for civil use, they were being completed for R.A.F. Transport command.

United States. Progress in 1951 was more notable in the field of aero-engines than in airframes, though a number of new military types were announced.

In transport aircraft, most manufacturers continued to produce existing models for military and civil needs. Much interest was being shown in the Canadian Avro Jetliner C-102, which paid visits to Washington for inspection by the U.S. air force and navy. Owing to backlogs in U.S. production, there seemed a possibility that Avro's might receive orders for Jetliners both as military and civil transports. Douglas sales of DC-6B transport aircraft numbered 83, and of DC-6 aircraft, 261. Consolidated Vultee's orders for their Convairliner 340 rose to just under 100, and deliveries were expected during the first half of 1952.

The shortage of used transport aircraft, due, to a considerable extent, to the needs of the Korean war, was accentuated. The market price of DC-3s and DC-4s was two to three times that before the Korean war. A Douglas DC-4 in good condition was worth \$350,000. The Military Air Transport service Pacific airlift chartered 66 4-engined transports from the airlines.

Republic's swept-wing fighter, the F-84F, a development of the Thunderjet, was to be powered by the Armstrong-Siddeley Sapphire engine, known in the U.S. as the J-65. Another interesting aircraft was the Lockheed F-94B, a long-range ground-support fighter, with a Pratt and Whitney J-48 turbo-jet engine with afterburner.

It was expected that the Allison J-35-A-23 engine (9,700 lb. static thrust) would be installed in the B-47B 6-engined bomber. Meanwhile, Pratt and Whitney began flight tests on their 10,000-lb.-thrust J-57 jet engine which, they claimed, had a more economical fuel consumption than any other engine in a similar stage of development anywhere. The U.S. navy placed a production order for a number of Allison T-40 turbo-prop engines to power the Convair XP5Y flying boat and the Douglas XA2D Skyhawk attack plane. The T-40 was made up of two identical power sections coupled through a common gearbox. Each power section was a complete T-38 engine, which was the power plant for the Convair turbo-liner, the prototype turbo-prop commercial transport undergoing trials during 1951.

The first theoretical phase of the project to study the possibility of producing an atom-powered engine was completed by the Fairchild Engine company. Phase 2, the production of an actual blue-print for a nuclear-energy engine, was to be handled by the General Electric company, at Lockland, Ohio.

Canada. A Canadian-designed fighter, the Avro CF-100, fitted with Canada's first jet engine, flew during June. The engine, the Orenda, also an Avro product, had a rated thrust of over 6,000 lb.

U.S.S.R. According to a statement by the British secretary of state for air, on Sept. 29, the U.S.S.R. was turning out in quantity a twin-jet bomber, somewhat similar to the British Canberra, with swept-back tailplane and fin. A new fighter, the MIG-19, was reported to show great promise. It was thought that it derived directly from the TA.183 *bis* fighter designed by Professor Kurt Tank for the Luftwaffe shortly before Germany's capitulation.

Western Europe. In France, the Marcel Dassault Mystère fighter, a successor to the Ouragan, was successfully demonstrated in July. Actually equipped with a Hispano-built Nene, it was proposed to replace the power plant with a Tay jet engine. The Atar series of gas turbines were being produced by the Société Nationale d'Etude et de Construction de Moteurs d'Aviation and showed considerable promise. The Atar 101B, flight-tested on top of a Languedoc 4-engined transport, gave a static thrust of 5,291 lb.

In the Netherlands, Fokker, who completed the move of their factory from Amsterdam to Schiphol airport, produced an advanced trainer, the S-14, equipped with a Rolls-Royce Derwent 5 engine. They also produced, with backing from the Dutch government and KLM (Royal Dutch airlines), a design for a twin-engine turbo-prop passenger aircraft.

In Italy the aircraft industry, possessing considerable manufacturing capacity, unfortunately shrank still further during 1951, owing to lack of orders. (See also JET PROPULSION AND GAS TURBINES.) (D. Cr.)

AIR FORCES OF THE WORLD. Great Britain and the Commonwealth. Although British aircraft production fell to a low ebb in the five years following World War II, research and development programmes, particularly in the field of high-speed jet aircraft, were maintained at reasonable levels and in 1951 were beginning to bear fruit in the form of fast fighter and bomber prototypes.

Prototypes of Great Britain's first four-engined jet bombers were flown in public at the Farnborough show in September. The Vickers Valiant was a swept-wing machine powered with four Rolls-Royce Avon jet engines completely housed in the wing root. The Short brothers SA.4 was a large monoplane with a pair of Avon engines, mounted one above the other and fitted into a single nacelle mounted on each wing. Production in quantity was still several years away. Meanwhile, the old post-World War II standbys, the Vickers Vampires and Venoms and the Gloster Meteors, continued to form the backbone of the R.A.F. fighter command. These jet fighters were also being produced for several nations, including France, Belgium, the Netherlands and the Scandinavian countries.

During 1951 Armstrong Whitworth put a new two-seat twin-jet night fighter into production, the MF.11. A development from the Gloster Meteor, it was fitted with Rolls-Royce Derwent engines. It was said to be very fast and capable of a variety of missions at night and in foul weather.

On the bomber side, the British Electric Canberra in the medium twin-jet category went into limited production and

A general view of the main assembly block of the Gloster Aircraft Co. at Gloucester, where Meteor jet aircraft were being manufactured during 1951. (See page 32 for photograph of completed aircraft.)

The world's first jet flying-boat fighter, the Saunders-Roe A.1, seen on the river Thames when it was moored near the South Bank exhibition.

the first of the jet bomber squadrons using these machines was put into commission by the R.A.F. The Canberra was also licensed for production in the U.S. by the Glenn L. Martin company of Baltimore, Maryland.

Most interesting of the British types flown during 1951 was a group of research aircraft intended for the study of flight at supersonic speeds. None of these machines had any immediate military value but they forecast the trends in combat designs. Three, the Fairey FD.1, the Avro 707 and the Boulton Paul P.111, were of the so-called delta-wing configuration.

During 1951 British jet engine development continued at a high level. No new types were announced but work progressed toward the attainment of high thrust and greater reliability. A number of engines that were considered experimental in 1950 were put into production in 1951; for example, the Rolls-Royce Avon was now specified for two R.A.F. fighters and two bombers, and plans for putting it into production in at least seven factories in Great Britain were being pushed at the end of 1951. The latest Derwent (the Mark 8) was also high on the Rolls-Royce production schedule.

De Havilland's Goblin and Ghost fighter engines were being widely used. The latest Goblin 35 had a rated sea-level thrust of 3,500 lb., the larger Ghost (5,000 lb. sea-level thrust) was fitted in a number of current R.A.F. and R.N. fighters, and the M.50 model powered the de Havilland Comet transport.

The Armstrong Siddeley Sapphire, with more than 7,500 lb. sea-level thrust, was one of the largest British jets. During 1951 the Wright-Aeronautical corporation of Wood-Ridge, New Jersey, was licensed to build this engine in the U.S.

To the so-called turbo-prop field (a conventional gas turbine driving a conventional propeller), two engines added considerable military significance in 1951, particularly for the R.N. The first was the Armstrong Siddeley Double Mamba fitted in the Fairey Gannet. It consisted of two Mamba turbo-prop engines mounted side by side, connected to a common gearbox and driving two separate four-bladed propellers on coaxial shafts. The other was the Armstrong Siddeley Python

used in the Westland Wyvern torpedo carrier. This engine was rated at more than 3,500 shaft h.p. plus 11,000 lb. direct thrust at sea level.

The Commonwealth countries contributed little to British air power in 1951. Canada was in the lead with a two-seat long-range, twin-jet all-weather fighter, the Avro CF.100 Canuck. The power plant was to be the Canadian-built Avro Orenda jet engine. The prototype was flown in 1950, and limited production began in 1951. Canadair Ltd. of Montreal (a subsidiary of the U.S.-owned Electric Boat company) began quantity production on the North American (U.S.) Sabre jet fighter during the year.

In Australia, activities were limited to the development of jet-powered target drones, expendable radio-controlled aircraft for gunnery practice. Test flying had been initiated in the rocket testing ground at Woomera in South Australia, and several British guided-missile manufacturers started test programmes there.

United States. During 1951 the U.S. air force made considerable progress toward the goal of attaining, by the end of fiscal year 1952, a modernized 95-wing air force with the necessary supporting units. In November an acceleration of this expansion appeared in prospect when President Harry S. Truman and the National Security council approved recommendations of the joint chiefs of staff that an air force of 143 wings (including 126 combat wings) be achieved during 1954.

About 150,000 men ordered into active military service from the reserve forces were absorbed into the air force with a minimum of training. In October the air force announced a revised, long-range programme for the training and recall of reserve forces. The new programme provided for technical training of air force reserves by civilian schools under government contract and the complete integration of the reserve organization, its administration, training and supply, with the regular establishment.

The installations of the air force were re-evaluated in the light of defence and training needs. The increase in personnel required additional and expanded facilities, especially of bases for training. Many World War II bases in the

continental United States were not properly located for air defence operations or for strategic counter-attack. Construction of new bases, rather than the re-commissioning of former bases, was necessary in only a few cases, but many facilities had to be modernized at existing bases. Bases in Greenland, Britain, France and elsewhere were activated or were under construction to support the forces of the North Atlantic Treaty organization (N.A.T.O.).

Orders were placed for aircraft to meet operational requirements in Korea and throughout the world and to anticipate future requirements. Contracts for production of the Canberra, the British-designed jet bomber (the first jet aircraft to fly the Atlantic non-stop without refuelling), as a night intruder aircraft (the B-57A) were let in March, and announcement was made of the commencement of ground tests on the B-60, a swept-wing all-jet version of the B-36 bomber. The B-52, a new all-jet long-range strategic bomber, was ordered into production. There was a step up in production of the F-89 (Scorpion) twin-engine all-weather night fighter and the B-47 Stratojet, a six-jet medium bomber.

On Sept. 19 President Truman signed the Air Force Organization act of 1951, the first detailed organizational legislation affecting the air force, and an act that established by law the three major commands of the air force.

The 1st pilotless bomber squadron (light) was commissioned on Oct. 1 at the U.S.A.F. missile test centre, Cocoa, Florida. This unit, equipped with the B-61 pilotless bomber (the Matador), was the first unit of its kind in the air force.

While support of the U.N. forces in Korea was given priority in air force operations during the year, increased support was given General Dwight D. Eisenhower's N.A.T.O. force. In May the 3rd air division (formerly an independent command with headquarters in England) became the 3rd air force and was made a part of the United States air forces in Europe (U.S.A.F.E.) under Lieut. General Lauris Norstad, who also commanded the central European components of the U.S. and Allied air power assigned to supreme headquarters Allied powers in Europe (S.H.A.P.E.).

In mid-January six B-36s flown from Carswell air force base, Texas, via Limestone, Maine, to Lakenheath, England, and non-stop from England to Texas on a routine training mission, were the first B-36s to appear in Europe. On May 7 a small number of air force personnel arrived in Iceland to help strengthen the defences of that country. The 433rd troop carrier wing, an Ohio air reserve unit commissioned in Oct. 1950 and flying C-119s, became the first air force combat unit to be permanently assigned in Europe since World War II and the first U.S. air unit specifically assigned to N.A.T.O. It arrived at Rhein-Main (near Frankfurt) air base on July 29. The first unit of the 81st fighter interceptor wing, a squadron

of F-86s, arrived in England in August, the first foreign air unit to become an integral part of the United Kingdom's air defence. The 126th bomb wing (B-26), a former air national guard wing with units from Illinois and Missouri, commissioned in April, was transferred to France, to be based at Bordeaux-Merignac aerodrome, the first U.S. combat force based in France since World War II.

From the beginning of the Korean war up to Nov. 27, 1951, aircraft under the operational control of the far east air forces flew a total of 336,063 sorties; during the same time, 354 aircraft of all types were lost to enemy fire. Casualty statistics to Nov. 23, 1951, indicated a total of 305 deaths, and 539 still missing in action, during the 16 months of the Korean war.

The U.S. far east air force flew about 615 sorties daily in support of ground action—most of them against ground targets from below 500 ft. altitude in the face of heavy automatic weapons' fire. U.S. heavy bombers dropped tons of propaganda leaflets over enemy territory, and night bombing attacks increased steadily. Radar aiming techniques were improved till night attacks attained an accuracy comparable to that of visual aiming methods. Particularly successful were the employment of B-26s against rolling stock and vehicles, and the B-29 strikes against Communist airfields. From August to mid-December, Operation "Strangle" exploited the dependence of the Chinese upon supplies from China and the Soviet Union. U.S. air attacks destroyed great quantities of Communist equipment: 67,850 vehicles, 1,236 locomotives, 23,500 railroad cars and 1,820 tanks were destroyed or damaged. The Communists suffered an estimated 138,388 casualties caused directly by air action.

The air force F-80 (Shooting Star), the faster F-84 (Thunderjet) and the still faster F-86 (Sabre jet) performed well against the Soviet-built MIG-15, an aircraft comparable in performance to the U.S. F-86 employed by the Communist forces, but a careful assessment of combat air action in Korea indicated that the real superiority of U.N. air forces over Communist air forces was in fire-control equipment and in the training and skill of U.N. pilots.

From Nov. 1, 1950, when the MIG-15 first made its appearance to Nov. 28, 1951, the day of the provisional cease fire, the U.S.A.F. lost 26 jet aircraft to enemy air-to-air action. During the same period it destroyed 152 Communist jets and probably destroyed 51 more—all MIG-15s.

At the beginning of the year, the U.S.A.F. had 560,000 personnel and 58 wings; on Oct. 31, 1951, it had 88 wings and its personnel strength was about 840,000, of whom less than 8% were officers. Women numbered about 12,000. The 95-wing air force had a personnel goal of 1,061,000.

(H. S. Vg.)

The United States 10-engine bomber, B-36, the world's largest military aircraft (wing span 230 ft., speed 435 m.p.h.), seen here on its first visit to Europe in Jan. 1951. For comparison a Gloster Meteor can be seen beside it.

U.S.S.R. Reliable production figures were entirely lacking in 1951. Guesses as to annual output ranged from 5,000 to 15,000 and for available combat aircraft, up to 20,000. Comfortable theories had been advanced to the effect that although Soviet technical skill remained as good as that of any other country, capability to organize production in quantity was still lacking. This was an unfounded and unsafe assumption, however. Many capable German technicians disappeared into the U.S.S.R. in 1945—men with a first-hand knowledge of turning out aircraft under the most adverse conditions in wartime. It would be unlikely that the experience they gained would be overlooked by Soviet planners. Such assistance, coupled with the fact that Soviet aircraft manufacturing plants were neither destroyed during World War II nor shut down afterwards gave pause to any facile discounting of Soviet production potential. Large aircraft, engine and accessory manufacturing centres probably had been built in the central Asiatic regions, but their exact location and their production rates were not known.

Information on Soviet aircraft, apart from observations made during the Korean war, came largely from reports during annual aircraft parades over Moscow, and from scattered sightings of new planes over the Soviet zones of Germany and Austria. It was, therefore, fragmentary and had always to be recognized as somewhat out of date when published.

When an MIG-15 was shot down in Korea in the summer of 1951 its power plant was identified with certainty. It became known that the Russians had combined the best of British and German jet engine practice into efficient designs of their own. They had not been blind copyists, but had made improvements in line with modern design, metallurgical and production techniques. There was no reason to believe that Soviet jet engines in use or under development in 1951 were inferior in any way to those on test beds in other parts of the world.

The same could be said of armament. Although the

experience of the Korean war had indicated that the larger (37 mm.) calibre slower-firing aircraft cannon fitted in the MIGs were not as effective for air-to-air jet combat as the U.S. smaller-calibre, higher-firing-rate guns, that lesson had not been lost on the Russians. Meanwhile, the larger cannon were known to be excellent for ground support tactics. The Russians had long been proponents of aircraft rocket ordnance. Their wing-carried rockets were highly developed during World War II, and with the aid of German rocket experts it seemed probable that this form of ordnance had not been neglected. Whether or not they had developed anything new in proximity-type fusing was speculative, but the operating principles of this useful device were so well known that its use by the Russians was almost a certainty.

The greatest Soviet weakness in 1951 probably lay in the area of application of electronic devices. A modern military aircraft was little more than an aerodynamically shaped housing around a maze of electronically actuated control, navigating, gun-aiming and gun-firing gadgets. As speeds and general performance of aircraft go up, the human pilot must rely more and more on "quick-thinking" vacuum tubes and electronic circuits to do his work effectively. U.S. aircraft and missile designers had a vast reservoir of radio technology and a tremendous electronic equipment manufacturing capacity at their beck and call—an asset that seemed almost entirely lacking to the Russians.

Few new aircraft types were identified during 1951. There were rumours of a new swept-wing fighter (tentatively designated as an MIG-17) seen both in Korea and in western Europe, which evidently outperformed the five-year-old MIG-15. Another tailless type, probably a development of a German Heinkel fighter of 1945, was reported flying in the vicinity of Moscow. Delta-wing designs for very high speeds were well advanced in German experimental plants by the end of World War II, and it was certain that Soviet designers were exploring the possibilities of this type as supersonic interceptor fighters, as were British and United States designers. Power plants for

Completed Gloster Meteor aircraft at Moreton Valence airfield, Gloucestershire, in March 1951. The aircraft (which are shown under construction on page 29) were awaiting delivery to the Royal Air Force and the air forces of Belgium, Denmark and the Netherlands.

such machines would undoubtedly consist of combinations of rocket motors and ram-jets.

In the bomber field no startling developments came to light in 1951. There were rumours of a large long-range intercontinental type similar to the U.S. B-36, but no confirmation from sightings or other sources. Meanwhile the TU-71, a Soviet adaptation of the B-29, continued to be the basic heavy bomber. These machines could carry an atomic bomb on one-way missions to many key cities of the United States.

More detailed information on the configuration and characteristics of the TU-10 medium twin-jet bomber came to light during 1951. This machine carried a crew of three. It could be adapted to a wide range of tactical and training uses

The British Supermarine 508. This aircraft, claimed to be the world's fastest and most powerful naval fighter, was on view for the first time in 1951.

with easy modifications of its armament and equipment. It was thoroughly modern in design and construction. Its two jet power plants, believed to be 6,000-lb.-thrust Soviet versions of the British Rolls-Royce Nene engine, gave the TU-10 a probable top speed of about 580 m.p.h.

From the standpoint of aircraft design and production, none of the Soviet satellite states was thought to be active in 1951. Certain research centres outside the U.S.S.R. (e.g., the rocket and guided missile testing station at Peenemünde, Eastern Germany, were being used, but under Soviet control. There were apparently scattered manufacturing plants building Soviet-designed aircraft in eastern Europe, but, as was illustrated by the capture of a U.S.A.F. C-47 transport in Hungary, and by the experience in air fighting in Korea, the Soviet Union's satellites were being supplied with Russian aircraft probably flown by Russian military pilots.

Other Countries. Practically all the fighting squadrons of N.A.T.O. countries that could be put into action immediately in 1951 were made up of aircraft of British or U.S. origin. The sole exception was Sweden, which listed a couple of jet fighters of Swedish design and construction. France had nothing to offer but a scattering of prototypes of only average military capability.

Argentina. Argentina was the only country in South America where military aircraft of modern design had been built, probably because of the presence of certain former French and German designers such as Kurt Tank and Amelio Dewoitine. The former was responsible for a high-performance, single-seat, swept-wing fighter, the I.Ae.33 Pulquí II, powered with a British Rolls-Royce Nene jet engine. Dewoitine designed the I.Ae.27 Pulquí I, also a Nene-powered jet fighter of less advanced type. This work was conducted at the Instituto Aerotecnico at Córdoba, a government-owned establishment. It was said to be the largest aircraft manufacturing plant in South America with a reported employment of more than 6,000.

France. The 19th Salon de l'Aéronautique held in Paris in the summer of 1951 revealed that the five-year rearmament plan for the French air force introduced in 1947 was pro-

gressing, but slowly. On the civil side, a number of transport, cargo and general utility types turned up, but results on the military side were disappointing. The only production was in British de Havilland Vampire Mark 5s with British engines, and the Dassault MD-450 Ouragan. The latter was a strictly French design of excellent performance. It was powered with Hispano-built Nene engines. A later Dassault jet fighter, the Mystère, was flown in prototype and was reported to show great promise, from the standpoints of both performance and production.

Sweden. Sweden's air force probably ranked as the fourth most powerful in the world in 1951. It was reported to include more than 50 combat squadrons, with a high proportion of jets. The programme called for an all-jet fighter force within two years. Although both U.S. and British aircraft were now used, an increasing number of Swedish-designed and built machines were coming off production lines. The J-29, the current production model, was a single-seat jet fighter of excellent performance powered with a Swedish-built Rolls-Royce Nene engine. A later model was reported in production, but details were lacking. It was significant that Sweden in 1951 was the only country (outside the U.S.S.R.) where large aircraft manufacturing and servicing plants had been put underground. (See also ROYAL AIR FORCE.) (S. P. J.)

AIRPORTS. During 1951, airport development was vigorously pursued. Although no new major airport of international class "A" classification was nearing completion—Jan Smuts airport in South Africa being subject to financial delays—new airports of class "B" standard established during 1951 included Luanda in Angola, intended for trans-Atlantic services to Brazil, and Khalde (Beirut) in the Lebanon. Entebbe, near the northern shores of Lake Victoria Nyanza, provided a good example of the type of long-established aerodrome that was being extended and improved to meet modern air traffic requirements. It was re-opened in its new guise on Nov. 10.

The importance of improving existing airports on world trunk routes lay in the necessity for providing adequate ground service for turbine-powered civil aircraft, shortly to go into scheduled operation for the first time. The high speed and high altitude at which these new types of airliners would fly demanded better runway specifications, quicker refuelling and handling at airports, more advanced navigational aids and telecommunications and, last but not least, improved meteorology, especially in forecasting weather at great heights.

Without such progress on the ground, all the economic advantages accruing from the introduction of the new power plants, whether they were gas turbines driving propellers or driving the airliner by pure jet thrust, would have been lost. The chief gain of turbine aircraft was expected to be seen not only in quicker passages for air travellers and freight but also in higher "utilization" as measured in flying hours per aircraft. In the case of Entebbe airport, for example, it should be appreciated that its location on the equator some 3,000 ft. above sea level demanded its improvement, having regard to the greater sensitivity of the gas turbine to tropical conditions and the need for longer take-off runs of aircraft at altitude.

Great Britain. In order to complete the sky surveillance available to control at London airport, Great Britain's chief airway terminal, it was expected that an intermediate radar system between the long range MEW (microwave early warning) and GCA (ground-controlled approach) would be used experimentally in 1952. This new azimuth scanner was designed to give better definition of incoming or outgoing aircraft in the control zone up to a range just short of 50 mi.

Constructional work at London airport continued steadily during 1951 with the excavation of the quadruple tunnel from the main highway to the central terminal site and the erection of several permanent hangar blocks on the maintenance sites, as previously planned. Some progress was also reported in the planning of the fuel "farm" with pipelines into the central area and in the completion of the design of some of the permanent buildings for the central terminal, which was intended ultimately to replace airport temporary buildings on the Bath road.

Australasia. Essendon airport (serving Melbourne) which had long been overshadowed by the Australian terminal of Mascot (Kingsford Smith airport) at Sydney, was raised to the status of "international." The opening, in 1951, of a direct air service between Melbourne and Christchurch, New Zealand, rendered this promotion inevitable. Progress in airport development in the latter country had been slow mainly because of labour and national finance problems. Harewood, at Christchurch, was likely to be speeded up in its development—it had to accommodate the finish of the proposed air race from Great Britain to New Zealand in 1953.

United States. During 1951 the Civil Aeronautics administration recommended the construction or improvement of no less than 4,945 civil airports within the U.S. This expansion, initiated by the Federal Airports act of 1946, would give the United States 64 airports of international class "A" standard, 77 for express routes (such as jet airliner operation), 303 terminal airports for ordinary trunk lines, 656 for feeder lines connecting to the trunk routes and the rest for secondary purposes such as town or private airfields. In the grand total, it should be noted, were 83 exclusive landing spaces for helicopters and 304 bases for marine aircraft operation. (C. F. As.)

On June 30, 1951, the end of the fifth year of the Federal Aid Airport programme, a total of \$166,537,603 in federal funds had been allocated, of which \$162,194,067 had been put under contract. Funds had been granted to 1,952 projects, of which 410 were under construction, 1,295 had been completed and 247 were being processed for construction.

Substantial progress was made in implementing the common system of air traffic control and navigation. At midyear, of the approximately 400 VOR (very high frequency omnirange) facilities required to cover the United States, 305 had been fully commissioned and 11 others were operating on a test basis. There were 98 instrument landing systems (ILS) in operation. Nine airport surveillance radar (ASR) systems and nine precision approach radar (PAR) facilities were in operation at Boston, New York International and LaGuardia, Newark, Washington National, Atlanta, Chicago Midway, Cleveland and Los Angeles airports. The two types of radar, when used together, constituted a ground-controlled approach system. (See also AVIATION, CIVIL.) (B. M. St.)

AIR RACES AND RECORDS. The 1951 British national air races were cancelled because of the very bad weather at Hatfield on June 23. Similar ill-luck attended the date planned for the *Daily Express* south coast race, but it was eventually staged for Sept. 22 over a 186-mi. course from Shoreham eastward, returning over a different route to a finishing line at Brighton. The winner was H. M. Kendall, flying a diminutive prewar Chilton D.W.1.

Several outstanding records were set up during the year, apart from the United States navy's claim that their Skyrocket had exceeded 1,000 m.p.h. and (in the same flight) had flown higher than any previous piloted aircraft—a claim inadmissible to the record book because of security restrictions—the most spectacular and significant achievements were the two east-west crossings of the North Atlantic by

English Electric Canberra twin-jet bombers. The pilot on the first occasion, in February, was Squadron Leader A. E. Callard; the second flight (officially observed) on Aug. 31 was in the hands of Wing Commander R. P. Beamont. He and his crew of two set up a Belfast-Gander course record by covering 2,072 mi. (3,334 km.) in 4 hr. 18½ min.—average speed 481 m.p.h. During Aug. 4-5 another Canberra, piloted by Squadron Leader D. R. Cuming, flew to Melbourne from Lynchem (Wiltshire) in under 25½ hr.

Great Britain also set up the first four "rate-of-climb" records (a new category) on Aug. 31, when R. B. Prickett of Glosters took up a Meteor 8 (with two Sapphire turbo-jets) from Moreton Valence to 12,000 m. in 3 min. 9.5 sec.

The U.S. won back one major record—speed over 100 km. circuit: during the (U.S.) national races (in August), Colonel F. Ascani flew an F-86 Sabre at Detroit at 635 m.p.h. (1,023 km.p.h.), and F-86 pilots were also outstanding in another of the "nationals," the transcontinental Bendix trophy, in which Colonel K. K. Compton averaged 551.76 m.p.h. over 1,920 mi. Two "unobserved" flights in pioneer style were those of Capt. C. Blair, who piloted his single-engined Mustang from New York to London in 7 hr. 48 min., and later crossed the North Pole en route from Norway to Alaska and New York.

The D.H. Comet appeared once more in the record lists by covering London-Karachi in 12 hr. 13 min., with Capt. A. Majendie in command.

The Fédération Aéronautique Internationale upgraded two international class records into the "world absolute" category: distance in a closed circuit, and speed over 100 km. (the first holder in the new grade being Ascani). Among several other innovations that became officially admissible were "point-to-point speed records for airline aircraft," and parachute jump records. (G. D. H. L.)

See B. J. Hurren, *Fellowship of the Air* (London, 1951); Geoffrey Dorman, *Fifty Years Fly-Past* (London, 1951).

ALASKA. Northernmost territory of the United States, separated from Siberian U.S.S.R. by the Bering strait. The Aleutian islands, extending 1,200 mi. westward from the extremity of the Alaskan peninsula, constitute part of the territory. Area: 586,400 sq.mi. Pop. (1951 est.): 136,000 excl. military, naval and coast-guard personnel. Chief towns (pop. 1950): Anchorage (11,060); Juneau (cap., 5,818); Fairbanks (5,625); Ketchikan (5,202). Governor, Ernest Gruening.

History. The most significant event during 1951 was the announcement of construction of a \$40 million pulp mill near Ketchikan. This basic forest industry was expected to do much to stabilize the economy of the southeastern region which had been of a seasonal character based on salmon and halibut fishing. Construction plans for Alaska's first plywood mill at Juneau were also announced.

Construction activities reached a new peak in 1950, the total programme being estimated at \$500 million. Although the bulk of activities centred on defence installations, numerous projects important to development of the territory were undertaken. Construction commenced on Alaska's first large hydroelectric plant (30,000 kw. installed capacity) at Eklutna, near Anchorage. Great strides were taken toward alleviating the critical housing shortage with the erection of numerous apartment buildings in Anchorage, Fairbanks, Juneau, Ketchikan and other communities. Paving of the interior highway system continued throughout the year. New construction included the linking of Anchorage with Seward on Kenai peninsula by a 128-mi. road.

(ER. GR.)

Education. Schools in 1951: 27 high (2,363 pupils); 73 elementary (12,234 pupils); native 96, incl. 3 boarding (5,407 pupils).

Banking and Finance. Cash balance at Dec. 15, 1951, \$4,331,687.

Fisheries. The salmon pack, considered the largest in the world, was 3,473,592 cases in 1951 with a value of about \$90 million. The halibut, shrimp, crab and cod fishery brought the total value of seafood packed to more than \$110 million.

Agriculture. Total value, \$2,186,000, of which \$1,275,000 came from Matanuska valley. A total of 1,061 ac. of new cropland were cleared during the year.

Mineral Production. Coal (1950) 412,455 tons; gold 289,272 oz.; sand and gravel 3,050,020 tons; other minerals, value \$2,463,000.

ALBANIA. People's republic in the western Balkans, bounded N. and E. by Yugoslavia and S. by Greece, with an Adriatic coastline of 200 mi. Area: 10,629 sq.mi. Pop.: (1930 census) 1,003,097; (mid-1950 est.) 1,200,000. Language: literary Albanian and two dialects, Gheg north of the river Shkumbi and Tosk in the south. Religion: Moslem 65%, Greek Orthodox 23%, Roman Catholic 11%. Chief towns (1949 est.): Tirana (cap. 40,000); Scutari or Shkodër (30,000); Koritsa or Korçë (28,000); Elbasan (18,000). Chairman of the presidium of the People's Assembly, Dr. Omer Nishani; prime minister, minister of foreign affairs and of national defence, General Enver Hoxha.

History. The theme that ran through events in 1951 was isolation. The main preoccupation of the Communist government was with real or imaginary attempts to overthrow a régime apparently cut off from outside help. The Soviet government continued to exploit to the best of its ability Albania's natural resources without committing itself to Albania's defence. In the capital numbers of Soviet advisers and technicians were to be seen and the Soviet press gave considerable publicity to Albania, but no moves were made to sign a Soviet-Albanian mutual defence treaty.

Throughout the year state security was emphasized. The most striking news to reach the outside world (although not officially confirmed) was the reported explosion of a time-bomb outside the Soviet legation in Tirana on Feb. 19. The explosion apparently did little damage and casualties were few, but the incident was followed by the arrest of between 300 and 400 Albanians, of whom 40 were executed immediately without trial. Shortly afterwards, on Feb. 25, the government issued instructions calling for a ten-day intensive campaign against elements hostile to the régime and ordering the immediate surrender of all firearms and close-combat weapons.

The government frequently announced the death or capture of "enemy agents" who had allegedly entered Albania illegally on instructions from western governments; these amounted to 65 during the year. At the same time Albania maintained its hostile attitude to Yugoslavia, Greece and Italy, despatching frequent protests against alleged violations of Albania's frontiers and air space.

In this uneasy situation the Albanian government pressed on as best it could with the economic and social measures outlined in the two-year plan. The government's agricultural policy, proclaimed at a session of the central committee of the Albanian Workers' (Communist) party on April 12 as further development of the collectivization of agriculture, was reversed at a second meeting of the committee on May 14. A warning was then issued against undue haste, and the party's policy was laid down as consolidation of results so far achieved. The government continued to make exaggerated claims of industrial progress; and on Sept. 26 it announced the introduction of a new five-year plan based on Soviet experience.

Major changes in the Albanian cabinet during the year were: in March, Spiro Spano, one of the deputy premiers, was dismissed; on Sept. 6 Mehmet Shehu, member of the politburo of the Albanian Communist party, deputy premier and minister of the interior, was relieved of all his duties and succeeded by Iosif Pasko.

An interesting development was the decree published on

Aug. 3 of a new statute for the Albanian Roman Catholic Church. Under this decree, the church was required to break off all relations with the Vatican and to conduct its external relations through the Albanian government.

Albania's diplomatic representation in western Europe was restricted to legations in Italy and France. The negotiations between Britain and Albania over compensation for the loss of two British destroyers and 44 British lives in the Corfu channel mining incident of 1947 continued during the year, but no settlement was reached. (M. MACK.)

Education. Schools (1949): elementary 1,910, pupils 162,000; higher elementary 145, secondary 20, total pupils 19,140. A teachers' college was opened at Tirana in 1946.

Agriculture. Main crops ('000 metric tons): wheat (1947) 54; maize (1947) 140; olives (prewar) 17; grapes (prewar) 14; potatoes (1949) 4; tobacco (1945) 1.5. Livestock (1946 est., '000 head): cattle and buffaloes 371; sheep 1,700; horses 50; pigs 35; goats 854; asses 40; mules 10.

Industry. Crude oil production (1950): 150,000 metric tons.

Foreign Trade. Before 1939, main imports were cotton yarns and manufactures, petrol, wheat and maize. Main exports were crude petroleum, skins and hides, foodstuffs.

Transport and Communications. Roads (1949): 1,766 mi. Licensed motor vehicles (Dec. 1950): cars 500; commercial 1,200. Railways (1950): 26 mi. Shipping (1949): merchant vessels 6. Post and telegraph offices 53. Radio receiving sets (1950): 40,025.

Finance. Monetary unit: *lek*, until mid-1948 at par with Yugoslav dinar, with an official exchange rate (Nov. 1951) of 139.25 lek to the pound and 49.6 lek to the U.S. dollar.

ALGERIA. French territory of north Africa, situated between Morocco (west) and Tunisia (east), with a status of government general of the French Union. Total area: 851,078 sq.mi., administered in two parts: Northern Algeria (80,919 sq.mi.), comprising the overseas *départements* of Algiers, Oran and Constantine, and the four territories of Southern Algeria (770,159 sq.mi.). Pop.: (1936 census) 7,234,684; (1948 census) 8,676,016 including 816,993 (9.4%) in the southern territories. Arabs and Berbers, who are Moslem, constitute 86.7% of the population; Europeans (1936) 987,252, predominantly Roman Catholic; Jews (1949 est.) 130,000. Administration: Algerian Assembly, 120 members elected by two colleges. In the first college there are all citizens of French status and Moslems distinguished by military, university, administrative or judicial qualifications; in the second college are grouped all other Moslem citizens. The Assembly manages Algerian affairs in agreement with the governor general, who has wide powers. Chief towns (1948 census): Algiers (cap., 315,210); Oran (256,661); Constantine (118,774); Bône (102,823); Tlemcen (69,668). Governor general, Roger Léonard.

History. The elections on June 17, 1951, to the National Assembly in Paris were notable for the total victory, in the second college, of the moderate independents over the nationalists of the Mouvement pour le Triomphe des Libertés Démocratiques (M.T.L.D.), autonomists of the Union Démocratique du Manifeste Algérien (U.D.M.A.) and Communists. In the first college victory went to the independents and the Rassemblement du Peuple Français (12 seats against 1 Socialist and 2 Communists). Similar results had attended the elections to the Algerian Assembly in February and were to attend those to the general councils (of the three *départements*) in October; in the latter the M.T.L.D. and the U.D.M.A. did not take part, alleging pressure by the authorities. On Aug. 5 these parties formed an Algerian Freedom Front (Front Algérien de la Liberté) with the Communists and the religious movement of the ulemas. New communes, with elected municipal councils, were set up.

The yearly increase of population reached 150,000, the number of departures for France 85,000. Output of citrus fruits, livestock, minerals, industrial produce was higher.

Education. Schools (1949): primary 2,188, pupils 331,700; secondary 128, pupils 23,400; technical, pupils 3,000; University of Algiers, students 4,977.

Agriculture. Main crops (1950, '000 metric tons): wheat 1,030; barley 780; oats 150; citrus fruits 250; olives 100; figs 50; dates 20; potatoes 210; vegetables 450; tobacco 19; wine ('000 hectolitres) 14,000. Livestock (1950, '000 head): cattle 766; sheep 4,500; goats 2,900; horses 220; asses 330; mules 230; camels 120.

Industry. Mineral production (1950, '000 metric tons): coal 250; iron ore 2,572; phosphates 585; zinc 16. Industrial production (1950, '000 metric tons): cement 324,000; superphosphates 90,853; paper 12,000; pig iron 5,900; copper wire 3,500; matches (millions of boxes) 181; electricity (millions of kwh.) 500.

Foreign trade (1950, million Fr.): imports 983, exports 112,232 (including 82,279 to France).

Transport and Communications (1950) Railways 4,500 km.; state roads 8,500 km.; secondary roads 26,000 km.; tracks in the Sahara 11,000 km. Motor vehicles licensed, 173,000. Ships entered: Algiers 3,621; Oran 2,660. Aircraft landed 10,792.

Finance. Budget (1951-52 est.): balanced at Fr. 72,000 million. Currency: Algerian franc = metropolitan franc.

See *Etat des opérations du plan pour l'Afrique du Nord* (Imprimerie Nationale, Paris, 1951). (HU. DE.)

ALIENS. The number of aliens registered in the United Kingdom on Oct. 1, 1951, was 420,595 (males 254,547; females 166,048), of whom 140,390 were living in the metropolitan police district (London). The figure on Jan. 1 was 429,329. The principal nationalities represented and the numbers of each compared with similar figures at the same date in 1950 were: Austrian 9,737 (10,037); Belgian 5,295 (5,520); Chinese 9,966 (9,725); Czechoslovak 5,223 (6,017); Dutch 9,363 (9,117); French 15,316 (14,901); German 47,359 (47,762); Italian 25,664 (21,672); Latvian 13,427 (13,794); Lithuanian 6,303 (6,860); Norwegian 6,096 (5,966); Polish 138,439 (145,524); Russian, including White Russian 35,743 (38,172); Swiss 12,255 (12,878); U.S. 20,894 (18,283); Yugoslav 9,151 (9,391). The figures included 10,000 aliens to whom no nationality could be attributed.

Among aliens not required to register and therefore not included in these figures were children under 16 years of age, members of the diplomatic and consular services of foreign governments, certain officials of international organizations, members of the U.K. armed forces and of certain foreign armed forces on duty in the U.K., British protected persons, and tourists and other visitors who spent less than three months in the U.K. The number of incoming travellers to the U.K. during the first nine months was over 630,000. In July 1951, 128,015 foreigners landed at U.K. ports and 106,772 embarked. Figures for July 1950 were 114,738 and 97,062.

In March 1951 the United Kingdom concluded a visa abolition agreement with Cuba. As the result of earlier agreements the nationals of the following countries were not required to obtain visas for travel to the U.K.:—Belgium, Denmark, France, Iceland, Italy, Liechtenstein, Luxembourg, Monaco, Netherlands, Norway, San Marino, Sweden, Switzerland and the United States. The provisions of the Aliens order, 1951 (Statutory Instrument 966/1951) included the extension from two to three months of the initial period during which a foreigner arriving in the U.K. was not required to register with the police and the extension from two weeks to two months of the period during which a foreigner living in the U.K. might be absent from his registered address without reporting the fact.

The number of foreigners admitted after the end of World War II to allow relatives in the United Kingdom to offer homes to foreigners in isolated and distressed circumstances abroad rose to over 7,300. During 1951 about 1,300 foreigners were allowed to remain in the U.K. after marriage to British subjects.

In 1951 some 36,000 permits were issued for non-resident foreigners to come and work in the United Kingdom for periods of varying length. The majority of permits were for

domestic employment in hospitals, institutions and private households. In addition, the number of German, Austrian and Italian women received under official schemes for employment in hospitals, institutions and the undermanned industries rose to 10,000, 2,300 and 2,000 respectively. Recruiting teams went to Italy to select men for work in coal-mining and other undermanned industries, and by Oct. 1951 1,100 men for the coal mines and 1,100 for other industries had arrived in the U.K.

There were also 77,000 foreigners, mostly of Polish or Baltic origin, who were temporarily accommodated in displaced persons' camps on the continent immediately after the end of World War II and had subsequently, prior to 1951, been admitted for employment in the United Kingdom with a view to settlement. With them came nearly 4,000 dependants. From Jan. 1, 1951, onwards, those with three years' residence were free to take any work they could obtain. In addition, some 15,000 former members of the German armed forces, 8,500 former Ukrainian prisoners of war and 1,000 Italian former prisoners of war who volunteered to remain in the U.K. to work in agriculture instead of accepting repatriation at the end of 1948, would be free to take any work they could obtain from Jan. 1, 1952, onwards.

Between Jan. 1 and Oct. 1, 1951, 3,576 new applications for naturalization were lodged compared with 5,702 for the same period in 1950. Certificates granted during the same period numbered 3,501. Under the British Nationality act, 1948, it was possible for alien wives of citizens of the United Kingdom and colonies (who did not now automatically acquire British nationality by their marriage) and alien minor children to obtain British nationality by registering as citizens of the U.K. and colonies: 4,528 alien wives and 768 minors were so registered between Jan. 1 and Oct. 1, 1951.

(T. G. W.)

United States. It is estimated that there were about 3 million resident aliens in the continental United States on June 30, 1946. This estimate does not take into account persons there temporarily, that is, non-immigrants, border crossers and imported labourers.

Naturalizations. The number of persons naturalized in 1951 was 54,716—the lowest total since 1910—and 2,935 petitions were denied.

In addition to those persons whose U.S. citizenship was revoked, 4,443 persons expatriated themselves by affirmative action: 1,401 by voting in a foreign political election or plebiscite; 1,084 through naturalization in a foreign state; 836 by taking up residence in a foreign state; 565 by serving in foreign armed forces; and 557 by leaving the U.S. to avoid military service and for other reasons.

NON-CITIZENS NATURALIZED IN THE U.S., 1948-51
(Years ended June 30)

Former nationality	1948	1949	1950	1951
British	12,361	13,284	12,697	10,867
Canadian	3,860	5,347	5,882	5,872
German	7,486	5,777	6,065	5,439
Italian	9,452	8,301	8,743	5,975
Polish	5,136	4,371	3,793	3,100
U.S.S.R.	3,143	2,752	2,122	1,830
Filipino	5,768	3,478	3,257	1,595
Mexican	1,895	2,227	2,323	1,969
Other	21,049	21,057	21,464	18,069
Total	70,150	66,594	66,346	54,716

New Legislation. On Aug. 27, 1951, S.2055—an omnibus bill having as its objective the complete revision of immigration and nationality laws—was introduced into the Senate.

The most important public law enacted during 1951 relating to immigration and naturalization, was the Internal Security act of 1950 (Public Law 831, effective Sept. 1950), the purpose of which was to protect the U.S. from subversive activities. The law required of each resident alien an annual

report of his address; it amended the immigration and nationality laws by refining, clarifying and augmenting the classes of persons to be considered as risks to internal security; it established that membership *per se* in Communist or other totalitarian groups should be cause for exclusion, deportation or denial of naturalization. It added ability to read and write English to ability to speak it as a prerequisite for naturalization.

Public Law 717, approved Aug. 19, permitted the admission of racially ineligible spouses and minor children of citizen members of the U.S. armed forces. The time limit of this act was extended by Public Law 6, approved March 19. (See also IMMIGRATION AND EMIGRATION.) (A. R. MACK.)

ALIMENTARY SYSTEM: see STOMACH AND INTESTINES, DISEASES OF.

AMBASSADORS AND ENVOYS. The following is a list of the chief diplomatic representatives to and from Great Britain, Dec. 31, 1951.

To Great Britain	Country	From Great Britain
*Shah Wali Khan	Afghanistan	*Sir A. J. Gardiner
*Carlos Alberto Hogan	Argentina	*Sir W. H. B. Mack
§§Lothar Wimmer	Austria	*Sir H. A. Caccia
*Vicomte Obert de Thieusies	Belgium	*Sir C. F. A. Warner
*Napoleon Solares Arias	Bolivia	*J. G. Lomax
*J. J. Moniz de Aragão	Brazil	*Sir G. H. Thompson
Naiden K. Nikolov	Bulgaria	J. E. M. Carvell
*U Ka Si	Burma	*R. L. Speight
*Manuel Bianchi	Chile	*C. N. Stirling
—	China	†L. H. Lamb

U Ka Si, the new Burmese ambassador in London, seen leaving his embassy on Oct. 23, 1951, to present his letters of credence to King George VI.

To Great Britain	Country	From Great Britain
*Rafael Sánchez Amaya	Colombia	Gilbert MacKereth
†Guillermo Padilla Castro	Costa Rica	H. B. Livingston
*R. González de Mendoza y de la Torre	Cuba	*A. Holman
*Josef Ullrich	Czechoslovakia	*P. H. Broadmead
*Count Eduard Reventlow	Denmark	*Sir Alec Randall
Julio Vega Battle	Dominican Rep.	S. H. Gudgeon
*Gonzalo Zaldumbide	Ecuador	*Norman Mayers
*Abd-el-Fattah Amr Pasha	Egypt	*Sir R. C. S. Stevenson
*Ato Abbebe Retta	Ethiopia	*D. L. Busk
Eero Aarne Wuori	Finland	Sir A. N. Noble
*René Massigli	France	*Sir Oliver Harvey
† H. Schlange-Schoeningen	Germany, Western	§Sir Ivone Kirkpatrick
*Leon Victor Melas	Greece	*Sir C. B. P. Peake
Francisco Linares Aranda	Guatemala	W. H. Gallienne
Love O. Léger	Haiti	D. J. M. Irving
Archbishop William Godfrey	Holy See	W. St. H. Roberts
Tiburcio Carius	Honduras	G. E. Stockley
Imre Horváth	Hungary	R. M. Hankey
Agnar Klemens Jónsson	Iceland	J. D. Greenway
*Subandrio	Indonesia	*D. W. Kermode
*Emir Zeid ibn al-Hussein	Iraq	*Sir J. M. Troutbeck
*Frederick H. Boland	Ireland	*Sir Walter Hankinson
Eliahu Elath	Israel	Sir F. E. Evans
†Livio Theodoli	Italy	*Sir Victor Mallet
¶Koishiro Azakai	Japan	**Sir Esler Dening
Faroz Pasha al-Mulki	Jordan	G. W. Furlonge (minister designate)
Myo Mook Lee	Korea	†A. C. S. Adams
Victor Khouri	Lebanon	E. A. Chapman-Andrews
Baron R. A. de Lynden	Liberia	J. G. Baillie
—	Libya	Sir Alec Kirkbride
André Clasen	Luxembourg	Geoffrey Allchin
*Federico Jimenez O'Farrill	Mexico	*J. W. Taylor
*Shanker Shumshere Jung Bahadur Rana	Nepal	*C. H. Summerhayes
*Jr. E. Michiels van Verduynen	Netherlands	*Sir N. M. Butler
—	Nicaragua	N. O. W. Steward
*Per Preben Prebensen	Norway	Sir M. R. Wright
Juan R. Morales	Panama	E. A. Cleugh
Pedro Godinot de Vilaire	Paraguay	Ian Henderson
*Ali Soheily	Paraguay	*Sir F. M. Shepherd
*Ricardo Rivera Schreiber	Peru	*Sir O. A. Scott
José E. Romero	Philippines	F. S. Gibbs
*Jerzy Michałowski	Poland	*Sir C. H. Bateman
*Ruy Ennes Ulrich	Portugal	*Sir Nigel Ronald
Nicolae Cioroiu	Rumania	W. J. Sullivan
J. Arturo Castellanos	Salvador, El	R. H. Tottenham-Smith
*Sheikh Hafiz Wahba	Saudi Arabia	*G. C. Pelham
*Duke of Primo de Rivera	Spain	*Sir John Balfour
*Bo Gunnar R. Hägglöf	Sweden	*R. B. Stevens
Henri de Torrenté	Switzerland	P. S. Scrivener
Edmond Homsy	Syria	W. H. Montagu-Pollock
*Phra Bahiddha Nukara	Thailand	*G. A. Wallinger
*Cevat Açikalin	Turkey	*Sir A. K. Helm
*Gheorghy N. Zarubin	U.S.S.R.	*Sir Alvary Gascoigne
*Walter Sherman Gifford	United States	*Sir Oliver Franks
*Enrique E. Buero	Uruguay	*D. F. Howard
*Carlos Sosa-Rodriguez	Venezuela	*Sir Robert Urquhart
Tran Van Don	Vietnam	††H. A. Graves
Hassan Ibrahim	Yemen	M. B. Jacomb
*Jože Brilej	Yugoslavia	*W. I. Mallet
—	United Nations	††Sir Gladwyn Jebb

* Ambassador. Unstarred, Minister. † Chargé d'Affaires. ‡ Consul General. § High Commissioner to Western German Federal government. || Apostolic Delegate. ¶ Chief overseas representative in Great Britain. ** Political representative. †† Permanent U.K. representative to the United Nations. ††† Also accredited to Cambodia and Laos. §§ Status raised to ambassador, Jan. 1952.

The following is a list of high commissioners within the Commonwealth of Nations, Dec. 31, 1951.

From Australia to	
Canada	Francis Michael Forde
Ceylon	(vacant)
Great Britain	Thomas Walter White
India	Herbert Roy Gollan
New Zealand	Arthur Roden Cutler
Pakistan	John Egeron Oldham
South Africa	(vacant)

<i>From Canada to</i>	
Australia	Gölin Fraser Elliott
Great Britain	L. Dana Wilgress
India	Warwick Fielding Chipman
New Zealand	Alfred Rive
Pakistan	Kenneth Porter Kirkwood
South Africa	T. W. L. MacDermot
<i>From Ceylon to</i>	
Australia	J. Aubrey Maartensz
Great Britain	Edwin Aloysius Perera Wijeyeratne
India	C. Coomaraswamy
Pakistan	T. B. Jayah
<i>From Great Britain to</i>	
Australia	Edward John Williams
Canada	Sir Alexander Clutterbuck
Ceylon	Sir Cecil George Lewis Syers
India	Sir Archibald Nye
New Zealand	Sir Charles Roy Price
Pakistan	Sir John Gilbert Laitthwaite
South Africa	Sir John Helier le Rougetel
Southern Rhodesia	Ian M. R. MacLennan
<i>From India to</i>	
Australia	K. S. Duleepsinhji
Canada	R. R. Saksena
Ceylon	K. P. Menon
Great Britain	V. K. Krishna Menon
Pakistan	Mohan Sinha Mehta

Canada	Alfred Adrian Roberta
Great Britain	Albertus Lourens Geyer
Southern Rhodesia	Terence Henry Eustace
<i>From Southern Rhodesia to</i>	
Great Britain	Kenneth M. Goodenough
South Africa	Anthony Drinkwater Chataway

AMERICAN LITERATURE. The 11,000 titles published in the United States in 1951 offered the reader the widest choice. In particular the enormous sale of paper-bound books amazed publishers. Harry Bennett's sensational story of his years as Henry Ford's right-hand man, *We Never Called Him Henry*, rejected by various trade publishers, became a best seller in paper covers.

Non-fiction came close to outselling fiction. Such trouble spots as the U.S.S.R., China, Japan, Israel, Argentina and the near east were much discussed. Robert J. Alexander's *The Peron Era* gave a history of the Argentine dictatorship. Justice William O. Douglas, after a trip through the middle east, questioned the wisdom of U.S. foreign policy there in *Strange Lands and Friendly People*. Paul Blanshard covered controversial territory in *Communism, Democracy and Catholic Power*.

Two important books were George Kennan's *American Diplomacy, 1900-1950* and Hans J. Morgenthau's *In Defense of the National Interest*. There were surprisingly few books about the war in Korea and a distinct falling off in the number of books about World War II. The Forrestal *Diaries*, edited by Walter Millis and E. S. Duffield, covered the war years and Omar N. Bradley told of his role in *A Soldier's Story*. Samuel E. Morison added another volume to *The History of United States Naval Operations in World War II*, "The Aleutians, Gilberts and Marshalls," covering amphibious warfare from June 1942 to April 1944. Eliot Janeway's *The Struggle for Survival*, one of the "Chronicles of America Series," surveyed the country's economic mobilization for World War II. Sumner Welles wrote about Franklin D. Roosevelt's important diplomatic decisions in *Seven Decisions That Shaped History*.

Alan Barth, in his balanced study *The Loyalty of Free Men*, examined the methods by which loyalty was being determined.

In *Crime in America*, Estes Kefauver drew up a report of the connections found between local politicians and the crime syndicates. Howard Whitman, in *Terror in the Streets*, developed the theory that the current wave of hoodlum terrorism was based on a psychological love of violence. Jack Lait and Lee Mortimer wrote their latest low-down report, *Washington Confidential*. Karl Schriftgiesser's *The Lobbyists* was a study of pressure politics.

In *The Conduct of Life*, the final volume of his distinguished series, Lewis Mumford proposed individual regeneration as the basis of a social philosophy for survival in our time. James B. Conant wrote *Science and Common Sense* and Hans Reichenbach, in *The Rise of Scientific Philosophy*, studied the background and growth of the new scientific philosophy.

One of the most widely read and praised nature books of the year was Rachel L. Carson's *The Sea around Us*, a beautifully written discussion of the sea, its history and inhabitants. Edwin Way Teale, in his elegiac *North with the Spring*, described the varying aspects of spring as it travelled north from Florida to New England.

In historical and biographical studies, Marshall B. Davidson's impressive two-volume *Life in America* provided a profusely illustrated social history of the country. Malcolm Cowley's revised and expanded *Exile's Return* was a personal account of the trek of the "lost generation" from Greenwich Village to the Left Bank and back. Selden Rodman made a social and psychological study in his *Portrait of the Artist as an American: Ben Shahn*. Dale Kramer's *Ross and The New Yorker* appeared only a few weeks before the death of Harold Ross.

The Harper History of Painting: the Occidental Tradition, by David M. Robb, covered time from the Stone Age to 1951, and John I. H. Baur assessed contemporary art in *Revolution and Tradition in Modern American Art*. Two histories of the drama were Alan S. Downer's *Fifty Years of American Drama, 1900-1950* and Glenn Hughes's *A History of the American Theatre, 1700-1950*. Abel Green and Joe Laurie, Jr., covered the past 50 years of the popular stage in *Show Biz: From Vaude to Video*.

Among historical figures, Jefferson received much attention during the year. The second volume, *Jefferson and the Rights of Man*, of Dumas Malone's excellent biography, *Jefferson and his Time*, appeared. Leonard D. White's *The Jeffersoniana* was a study in administrative history. Under the editorship of Julian P. Boyd, Lyman H. Butterfield and Mina R. Bryan, two more volumes of the *Papers* of Thomas Jefferson were published, volume iii, 1779-80, and volume iv, 1780-81. Other biographies included volume iii of Douglas Southall Freeman's monumental *George Washington: A Biography*; the third and final volume of Calhoun's life by Charles M. Wiltse, *John C. Calhoun*; Bradford Smith's *Bradford of Plymouth*; and Waldo Frank's *Birth of a World*, the life and times of Simon Bolivar. Elting E. Morison published the first four volumes of the *Letters* of Theodore Roosevelt. Richard H. Royere and Arthur M. Schlesinger, Jr., wrote *The General and the President and the Future of American Foreign Policy*, a pro-administration analysis of the Truman-MacArthur controversy.

Fiction. The most successful of the war novels was Herman Wouk's *The Caine Mutiny*, a fine sea story, though a less convincing account of a Princeton boy's maturing in the stress of Pacific naval war. In contrast was John P. Marquand's portrait, *Melville Goodwin, U.S.A.*. Robert Bowen's *The Weight of the Cross* described the spiritual regeneration of a man during years in a Japanese prison camp.

The most controversial novel of the year was James Jones' *From Here to Eternity*, a diffuse naturalistic exposure of the

depravity in the regular army just before Pearl Harbour. Norman Mailer's *Barbary Shore*, forsaking the solid realism of *The Naked and the Dead* and developing its latent strain of symbolism, attempted an ambitious allegorical treatment of political and moral issues, but the form soon dissolved into overt discussion.

J. D. Salinger, in *The Catcher in the Rye*, caught most successfully the mood, agony and language of a 16-year-old boy getting tough with the world. William Styron won considerable notice with his first novel, *Lie Down in Darkness*. It was the familiar story of the degeneration of a southern family. Wright Morris, in *Man and Boy*, presented a satirical character study of a mother as she christens a ship named after her dead son.

William Faulkner did not enhance his reputation with *Requiem for a Nun*. John Dos Passos, in *Chosen Country*, through the story of his character's American antecedents, brought them to a peaceful contentment with the country of their parent's choice. Sinclair Lewis' posthumous novel, *World so Wide*, was far from his great works.

George R. Stewart's attempt, in *Sheep Rock*, to give personality to a landscape, though less effective than his studies of storm and fire, was nevertheless vivid. James Aldridge's *The Hunter* was an almost idyllic story of trappers in the north woods. Laura Z. Hobson satirized a man risen suddenly to literary fame in *The Celebrity*. Stephen Becker's first novel, *The Season of the Stranger*, told the story of an American professor in southern China.

Belles Lettres. The year 1951, the 100th anniversary of the publication of *Moby Dick*, brought several important contributions to Melville studies. Jay Leyda's monumental documentary biography, *The Melville Log*, gave a record of Herman Melville's life with new materials gathered from all contemporary sources. Closely related was Leon Howard's *Herman Melville*, a new and circumstantial interpretation with a detailed account of the composition of his works. Another figure who was being currently rediscovered was studied in Arthur Mizener's *The Far Side of Paradise*, a critical biography of F. Scott Fitzgerald.

There were three additions to the distinguished "American Men of Letters Series": F. W. Dupee's *Henry James*, F. O. Matthiessen's *Theodore Dreiser* and Irving Howe's *Sherwood Anderson*. James Schevill's *Sherwood Anderson: His Life and Work* gave a new interpretation. Henry Seidel Canby added *Turn West, Turn East* to the list of his able studies of American writers. Mildred R. Bennett's *The World of Willa Cather* was a collection of interviews and reminiscences from her Nebraska home country. Harry Modean Campbell and Ruel E. Foster wrote *William Faulkner: A Critical Appraisal*. Two other biographical studies of contemporaries were Donald Sutherland's *Gertrude Stein* and William Manchester's *Disturber of the Peace: The Life of H. L. Mencken*.

A. H. Quinn edited a one-volume survey, *The Literature of the American People*. Studies of 20th-century literature were Frederick J. Hoffman's *The Modern Novel in America, 1900-1950* and John Aldridge's *After the Lost Generation*.

Among collections of essays the most notable were *The Kenyon Critics*, edited by John Crowe Ransom, and Edmund Wilson's *Classics and Commercial: Literary Chronicle of the Forties*. George Santayana, in *Dominations and Powers*, discoursed on liberty, society and government. Peter Russell edited *An Examination of Ezra Pound*, and Hugh Kenner wrote a study, *The Poetry of Ezra Pound*. Virgil Thomson collected his musical criticism in *Music, Right and Left*.

Poetry. William Carlos Williams completed his long work with *Paterson*, book iv, and published *Autobiography*, his life as physician and poet. Robert Lowell, former Pulitzer prize winner, wrote *The Mills of the Kavanaughs*. The reflective lyrics of Theodore Roethke's *Praise to the End!* reached back

into the experiences of the poet's childhood. *Celebration at Dark*, by William Jay Smith, and *Ceremony and Other Poems*, by Richard Wilbur, were collections of lyrics by young writers. W. H. Auden published *Nones*, 31 new poems dealing with the problems of our civilization. Randall Jarrell wrote *The Seven-League Crutches*, and Kenneth Rexroth's *Beyond the Mountains* was a group of four one-act verse plays on classic themes. Horace Gregory's *Selected Poems* covered the range of his work and consolidated his reputation. On the whole, the year's poetry was more impressive than its fiction. (See also LITERARY PRIZES.) (H. M. H.)

ANAEMIA: see BLOOD, DISEASES OF THE.

ANDORRA. Small autonomous principality between France and Spain, bounded on the N. by the *départements* of Ariège and Pyrénées Orientales, and on the S. by the Spanish province of Lerida. Area: 191 sq.mi. Population (1951 est.): 5,400. Language: Catalan. Religion: Roman Catholic. Capital: Andorra-la-Vieja (pop., 1951 est., 980). Co-princes: the president of the French republic and the bishop of Urgel, Spain, respectively represented in 1951 by André Bertrand and Jaime Sansa Nequi, their *viguiers*. An elected general council of 24 members appoints one of its members as the *syndic général des vallées* (from 1946: Francisco Cayrat).

ANDREYEV, ANDREY ANDREYEVICH, Soviet politician (b. 1895). The son of a peasant, he joined the Communist party in 1914 in Petrograd. In 1919 he was organizer of the metal workers in the Urals and from 1920 to 1926 chairman of the Railwaymen's union. From 1924 he served as one of the secretaries to the central committee of the party. Elected a member of this committee (1925), he was also appointed a substitute member of the politburo of which he became a full member in 1932. In 1930-31 he was chairman of the Party Control commission. From 1931 he served as people's commissar of transport and in Oct. 1935 was made chairman of the Council for Collective Farm Affairs. In 1943-46 he was minister of agriculture and as such responsible for food supply during a critical period. On March 19, 1946, he was appointed a deputy chairman of the council of ministers. On Feb. 19, 1950, *Pravda* criticized him for favouring the operation of collective farms by small units of workers or links, against the party view that they should be worked by large units or brigades. Andreyev made a public self-criticism but his standing in the party hierarchy appeared unshaken. On March 12, 1950, he was elected a member of the Soviet of the Union for Ashkhabad and on Feb. 16, 1951, the member of the Supreme Soviet of the Russian S.F.S.R. for Novosibirsk.

ANGLICAN COMMUNION. At the 1951 Church of Ireland general synod, the primate (the Most Rev. J. A. F. Gregg) drew attention to the lack of ordination candidates. The proposal to reduce the size of the Irish *Church Hymnal* was referred back to its committee, as also was the question of relations with the Church of South India. A "week of witness" was held in Belfast, the biggest mission in the Church of Ireland for many years. For the restoration of Armagh cathedral £19,000 was raised. The archbishop of Armagh, together with the bishops of Derby and Gibraltar, represented the Anglican communion at the 19th centenary celebrations of St. Paul the Apostle in Greece. The archbishop of Wales appointed a liturgical commission to draw up amendments to the "law of worship." The commission would report to the bench of bishops who would bring approved amendments before the governing body of the Church in Wales. A mission was conducted throughout the diocese of Monmouth.

The Rt. Rev. A. H. Howe Browne, one of the six English bishops commissioned by the Society for the Propagation of the Gospel to take greetings to countries where the society has worked. The galleon—a collecting box—was a model of the “Centurion” in which the society’s first missionary sailed to America in 1702.

Thirty chaplains of the diocese of Northern and Central Europe met at Fulham palace for their annual conference. The bishop of Fulham presided. He reported that he had visited Moscow, Warsaw and Prague. In July a garden party was held at Fulham palace to raise funds for the diocese. It was opened by Princess Alice.

Insufficient numbers of clergy, which concerned the Episcopal Church in America as most other churches of the Anglican communion, were partly made good, especially in the dioceses of Minnesota and Missouri, by the ordination of laymen, who had to be not less than 32 years old. They were excused certain examinations. The House of Bishops, under the Right Rev. H. K. Sherrill, the presiding bishop, made regulations for chaplains to U.S. forces in Europe and the Pacific. In Europe they were placed under the supervision of Bishop John I. B. Larned and in the Pacific under that of the bishop of Honolulu. The Presiding Bishop’s Committee on Laymen’s Work reported an increased number of “parish keymen” (3,201) who interpreted the missionary and educational policy of the Episcopal Church to the parishes. They were especially successful in the “Every Member Census” to raise money for these objects. Clerical stipends in the Episcopal Church rose. Films were now being produced by the Department of Promotion, the National Council of the Episcopal Church and by the Cleveland (Ohio) Film council.

Church people in Japan sent a cope to the bishop of Chicago in gratitude for a month’s mission that he had

conducted among them. He flew to Japan from the United States and was greeted by the presiding bishop (the Most Rev. Michael Hinsuke Yashiro) and four other Japanese bishops. The bishop of Exeter visited the Episcopal Church of America and lectured on canon law at Berkeley, California, and on moral theology at San Francisco. He also preached at Los Angeles, Washington, Wilmington, Delaware and New York. The bishop of Sheffield lectured at McGill university, Montreal, and visited the U.S. The bishop of Gibraltar toured the U.S. Dr. S. C. Carpenter, the former dean of Exeter, visited churches in the West Indies. The bishop of Q’Appelle (Canada) established a community on Franciscan lines to conduct mission work in rural dioceses.

The general synod of the Church in Australia reported on the archbishop of Canterbury’s visit (1950) and discussed the problems of the World Council of Churches, the Church in South India, the Central Anglican college (St. Augustine’s, Canterbury, England) and the Society for Promoting Christian Knowledge. It made an appeal for the work of the Australian Board of Missions in New Guinea, Japan and the Pacific islands. The diocese of Auckland (New Zealand) held a mission on the lines of the Mission to London (1949). This was inspired by the archbishop of Canterbury’s visit to New Zealand at the beginning of 1951. The archbishop of York toured Australia, New Zealand, Tasmania, Fiji, New Guinea, Singapore and Malaya. A fund was opened to rebuild the pro-cathedral at Tokyo; the cathedral at Hong Kong was restored. The cathedral at Gibraltar was damaged by an ammunition explosion. The bishop of Derby’s committee on the scheme for reunion in Ceylon gave cautious general approval to it.

The bishops of Southern Rhodesia, Nyasaland and Northern Rhodesia met at Likwenu (Nyasaland) and at Lusaka (Northern Rhodesia) to draft a constitution and canons for the new province of Central Africa. The archbishop of Canterbury, accompanied by the dean of Manchester (Bishop Wilson) and the assistant bishop of Worcester, inaugurated at Lagos the new province of West Africa. The bishop of Lagos (the Right Rev. L. G. Vining) was elected the first archbishop. A plan for the reunion of certain churches in Northern India and Pakistan was published. The draft of a new prayer book for the Church in India, Pakistan and Burma was approved by the general synod. (See also CANTERBURY, ARCHBISHOP OF; CHURCH OF ENGLAND; CHURCH OF SOUTH INDIA; MISSIONS, FOREIGN RELIGIOUS; WORLD COUNCIL OF CHURCHES.)

(A. J. MACD.)

ANGLING. The feature of 1951 was the numerous special competitions held by inland clubs and coast towns in conjunction with the Festival of Britain celebrations. An international contest on the Thames in August attracted several continental anglers; the Birmingham team were runaway winners with 73 lb. Plymouth staged a successful first sea angling festival in September. The first individual sea angling championship of Great Britain was held at Dover; the winners were J. B. Hurd (pier) and H. Maybee (boat). Another innovation (also to be an annual event) was the amateur sea casting championship at Deal, Kent, in which casts of up to 131 yd. were recorded.

The annual all-England match, fished on the River Witham, Lincolnshire, in September, was won by Doncaster and District Anglers’ association with 63½ lb.; a member of that team, S. Buxton, was individual winner with 20½ lb.

New record weights were set up for chub (8½ lb., River Rother, Sussex, July), gudgeon (5 oz. 1 dm., Dorset Stour, August), mirror carp (31½ lb., River Wye, Herefordshire, October), Crucian carp (4 lb. 15 oz., Brynmill lake, August),

thornback ray (57 lb., Exmouth, Devonshire, July) and porbeagle shark (300 lb., Looe, Cornwall, June). Another remarkable specimen was a 12½ lb. tench from the River Kennet, Berkshire, which was not accepted for record purposes as it was a freak, egg-bound fish measuring only 18 in.

(D. F. Ky.)

ANGLO-EGYPTIAN SUDAN. Territory in north-east Africa under the joint sovereignty of Great Britain and Egypt. Area: 967,500 sq. mi. Pop. (no census ever taken, 1948 est.): 7,547,500. Language: English, Arabic, and various Nilotic and Negro tribal dialects in the south. Religion: Arabic minority is Moslem; the bulk of the Negro population is heathen; only c. 20% of population in the south is Christian. Chief towns (1948 est.): Khartoum (cap., 71,400); Omdurman (125,300); El Obeid (70,100); Wad Medani (57,300); Port Sudan (47,000). Governor general, Sir Robert Howe.

History. It was inevitable that the events of 1951 should be overshadowed by the mounting Anglo-Egyptian dispute, in which the future of the Sudan was one of the two major issues at stake. This dispute naturally attracted a great part of Sudanese attention, and towards the end of the year it had considerable repercussions in the Sudan itself, but there was too a steady development along the predetermined path to self-government and independent statehood. The characteristics of life in a contemporary state, good and bad, again showed themselves ever more frequently in Sudanese life.

The Sudanization of government proceeded apace. It was announced on Jan. 20 that a Sudanese had been appointed director of the Obeid district, and echoes of the world-wide conflict were heard when, on Feb. 3, the police raided the homes of a number of adherents of the so-described "peace campaign" and seized a quantity of Communist literature. Subsequently 16 young Sudanese were put on trial for participating in this movement and were convicted on May 9. Meanwhile, on April 23 over 100,000 Sudanese workers began a three-day strike under the auspices of the Sudanese Trade Unions federation in an attempt to obtain substantial wage increases, shorter working hours and other advantages. The rejection of demands for higher wages led in May to a strike of public transport in Khartoum which seriously interrupted the life of the city for a period of five days. More serious perhaps was the strike of policemen that took place in Khartoum in June, leading to the declaration of a state of emergency on June 13 and the eventual imprisonment of 11 strike leaders. Following all this, a four-day strike of government unions occurred in Khartoum.

Meanwhile the issue of the demand for early self-government received close attention. On Dec. 15, 1950, the legislative assembly had voted by 391 to 38 in favour of asking the United Kingdom and Egypt for Sudanese self-government in 1951. At the conclusion of its second session on April 4, 1951, the assembly heard a message from the governor general to the effect that this request was receiving the fullest consideration.

Later in the year the question of the future of the Sudan became magnified once more from one of overmastering domestic interest into the status of a major issue in international relations, when the intensification of the Anglo-Egyptian conflict concentrated attention on the renewed Egyptian demand for the "unity of the Nile valley."

This development produced substantial changes in the situation of Sudanese political parties as it had first emerged in 1948. The Ashigga group, led by Ismail el-Azhari, aspiring to the Nile valley unity was seriously disrupted by the announcement of the defection of the followers of Ali el

Mirghani to the side of full self-government. Egyptian attempts to restore unity to the "internal struggle front" were unsuccessful.

The pro-Egyptian faction in the Sudan was thus seriously weakened by the events of the year. On the other hand it became abundantly clear that the Independence front, led by Abdurrahman el-Mahdi, head of the Umma (Nation) party, and Miralai Abdullah Khalil, president of the legislative assembly, was in no sense a mere instrument of British interests as they made clear their desire for immediate self-government. Their principal objective continued to be resistance to Egyptian claims for the absorption of the Sudan and their aspirations clearly coincided with the intention of the British government, which reiterated its refusal to consent to the renewed Egyptian demand for the acknowledgment of Egyptian sovereignty in the country. (See also EGYPT.) (H. S. D.)

Education. (1950) *Northern System.* Government schools: elementary 262, pupils 37,000; sub-grade and Koran 540, pupils 40,000; intermediate 21, pupils 2,661; secondary 6, pupils 1,457; technical 3, pupils 264; teachers' training colleges 5, teachers trained annually over 255. Non-government schools 172, pupils 15,900. University education at Gordon Memorial college and higher education at Kitchener School of Medicine. *Southern System.* Schools: elementary 3, pupils 327; secondary 1; intermediate 1, pupils 150; pupils at mission schools 23,384. Government training schools 2; primary teachers' training centres 2.

Agriculture. Main crops ('000 metric tons, 1949; 1950 in brackets): cotton, ginned, 66 (86); cottonseed 110 (70); sesame seed 72.3; gum arabic, exports, 33.9; groundnuts 9; dates 25; maize 19; millet 100; sorghum 642. Livestock ('000 head, Jan. 1949): cattle 3,500; sheep 5,500; camels 1,500; horses 20; pigs 4; goats 4,300; asses 500.

Foreign Trade. (£E million, 1950): imports 26.8; exports 33.2. Main sources of imports: U.K. 40%; India 14%. Main destinations of exports: U.K. 54%; India 12%. Main imports: sugar, coffee and tea 18%; cotton piece-goods 12%; coal, oil fuel and petrol 5%. Main exports: raw cotton 69%; gum 8%; cottonseed 6%; livestock 5%.

Transport and Communications. Railways (1950): 2,056 mi. Licensed motor vehicles (Dec. 1950): cars 3,500; commercial 4,500. Telephone subscribers (1949): 3,520. Wireless licences (1949): 3,227.

Finance and Banking. Budget (£E million): (18 months 1950-51, actual) revenue 44.8, expenditure 23.2; (1951-52 est.) revenue 24.8, expenditure 17.8. Total external debt (Dec. 31, 1949) 12.3, of which 5.3 to Egypt for development. Monetary unit: Egyptian pound with an exchange rate of £E 0.975 to the pound sterling and £E 0.348 to the U.S. dollar.

ANGOLA: see PORTUGUESE OVERSEAS TERRITORIES.

ANNAM: see INDOCHINA.

ANTARCTICA. There was considerable activity in the Antarctic in 1951. Most of the expeditions were sponsored by governments. Exceptions were the International Norwegian-British-Swedish expedition to Queen Maud Land, a small British expedition to South Georgia and the French Adélie Land expedition. Even these were assisted by government money and material.

International Norwegian-British-Swedish Expedition. During the southern summer of 1950-51 this expedition carried out extensive journeys with dog teams and "weasel" tractors from Maudheim. The longest lasted five months. A. Reece, a British geologist, damaged his eye with a splinter of rock and some months later it became necessary to remove the eye. This operation was successfully performed after members of the base had been trained in operating theatre practice and some of the instruments made locally. In addition to the geological and survey work accomplished during the principal journey, seismic sounding of the ice continued and detailed meteorological records were maintained at the base. In Dec. 1951 the motor sealing ship "Norsel" (Capt. Guttorm Jakobsen) left Tromsø on her third journey to the Antarctic, this time to take off the whole expedition on the conclusion of its work in Jan. 1952.

South Georgia Survey. This private expedition was organized and led by Duncan Carse to survey the southeastern part of the island including the high mountain backbone. These difficult mountains had only once been crossed when Shackleton's boat journey from Elephant island ended on the south side of the island and he was compelled to cross the mountains to the whaling base at Grytviken. Carse's party was expected to return to Britain in 1952.

Falkland Islands Dependencies Survey. The six bases of the survey continued with three-hourly meteorological observations and at the bases on South Georgia and the South Orkney islands biological work on seals and penguins was in progress. During 1950-51 sledging was restricted to short journeys but the re-establishment of the base at Hope bay on the northern tip of the Graham Land peninsula early in 1952 was expected to be the beginning of new and more extensive survey journeys. The survey's ship "John Biscoe" left Southampton with relief personnel for all bases on Oct. 22, 1951.

French Activity. The private French expedition to Adélie Land under A. Liotard was relieved by a second party which was to stay until 1952. The base was named Port Martin after a member of the expedition who died during the outward voyage in 1948. The expedition used "weasels" and dog sledges. Journeys were made east and west across the width of Adélie Land both on the sea ice and on the plateau. In all, these totalled some 1,600 mi. Sir Douglas Mawson's old base of 1911 at Cape Denison was visited and found intact. The expedition's work included survey, meteorology, seismology, ionospheric soundings and biology. A party sponsored by the French government and led by Lieut. Colonel Sicaud was established on Kerguelen island where an aerodrome was being constructed and attempts were being made to introduce new species of animals such as deer and freshwater fish.

Other Expeditions. The bases on Heard island and Macquarie island were relieved and the scientific studies already in progress there were continued. The royal research ship "Discovery II" under the direction of the Oceanographical institute completed a 20-month commission in the Australian and Pacific sectors where she carried out a complete circumpolar voyage to complete work with lines of comprehensive deep sea stations in special areas and in particular seasons, including winter.

Both Argentina and Chile extended their activities within the Falkland Islands dependencies sector of the Antarctic. Both countries set up new bases during the 1950-51 season in the area of Paradise harbour (lat. 64°50'S, long. 62°45'W), but the Argentine base was reported to have been destroyed by fire shortly afterwards. In addition it was reported that Argentina had opened another base named General San Martin in lat. 66°55'S, long. 67°30'W.

All nations previously occupied in whaling continued their operations in a successful season. The tendency to return to the old grounds of the Ross sea area was again in evidence. The Russian factory ship "Slava" accompanied by 15 catchers took 106,752 barrels of oil, the largest catch they had made in five postwar seasons. It was reported that they visited certain islands discovered by Bellinghausen 130 years ago; it was presumed that these were the South Sandwich islands. (See also EXPLORATION AND DISCOVERY.) (V. E. F.)

See E. W. Hunter Christie, *The Antarctic Problem* (London, 1951).

ANTHROPOLOGY. Eastern Hemisphere. The primary importance of blood group research in the study of the history of present peoples, their migrations and their genetic and racial affinities was strikingly emphasized in 1951 by the Royal Anthropological institute. In March, a symposium was organized at which papers were read by Professor R. A. Fisher (Cambridge), C. D. Darlington (John Innes Horticultural institution, Bayfordbury, Hertfordshire), J. A.

Fraser Roberts (London), I. M. Watkin (National Blood Transfusion service) and A. E. Mourant (Medical Research council) (see *Man*, London, July 1951). As a result of the meeting, it was decided to form a Blood Group centre of the Royal Anthropological institute; a grant of £14,000 over five years was made to the institute by the Nuffield foundation and it was announced that the new centre, to be called the Nuffield Blood Group centre of the Royal Anthropological institute, would become active early in 1952. A. E. Mourant was appointed honorary director. One important piece of field research was carried out by means of a grant from the Royal Anthropological institute. N. A. Barnicot (London) proposed to undertake blood-sampling among the Tuareg; this work was regarded as of special importance as being likely to throw light on the relationship of the Berber peoples to those of Europe and, in particular, on the possibility of a connection between Basques and Berbers, existing data on both peoples showing a high frequency of group O and a high frequency of Rh negative.

In 1950, U.N.E.S.C.O. issued a statement on the concept of race. This led to much discussion and considerable criticism from anthropologists (see *Man*, Oct. 1950, Jan. 1951 and April-Sept. 1951). In June 1951 it was announced that, as a result of the article "U.N.E.S.C.O. on Race" (*Man*, 220, 1950), the director general of U.N.E.S.C.O. had decided to convene a panel of physical anthropologists and biologists to prepare a new statement; the panel met in Paris in June, and the new statement was considered.

E. Voce published (*Man*, Jan. 1951) the spectrographic analysis of a broken celt from Scotland (from the National Museum of Antiquities of Scotland), on behalf of the Ancient Mining and Metallurgy committee of the Royal Anthropological institute. The same committee published (*Man*, March 1951) a technical report by H. H. Coghlan, W. Watson and E. Voce on a fragment of the Welwyn bowl in the British museum. H. H. Coghlan, in an article "Native Copper in Relation to Prehistory" (*Man*, July 1951), drew attention to the need for more research into the rise and technical progress of the early metal-working cultures and, in particular, to the development of the process of annealing.

In human palaeontology work went forward particularly on the interpretation of the finds in southern Africa. In this connection J. T. Robinson (Pretoria museum) addressed the Royal Anthropological institute on "The South African Ape-men and their Affinities," his interpretation inclining to agree with that of Professor W. E. Le Gros Clark rather than with that of Professor S. Zuckerman. L. H. Wells (Witwatersrand) also addressed the Royal Anthropological institute on "Fossil Man in Southern Africa." Others pursuing field work in Africa were the Americans William R. Bascom, who conducted research among the Yoruba of Nigeria, Martin Gusinde, who worked among the Bushman-Hottentot in South Africa, and G. L. R. von Koenigswald, who studied the ape-man fossils in Transvaal. The Abbé Breuil worked on the prehistoric rock-paintings in France and in the autumn paid a brief visit to England where he addressed the Royal Archaeological institute.

Zeitschrift für Ethnologie resumed publication, under the editorship of Georg Eckert, after an interruption of six years. The *Zeitschrift für Eingeborenen-Sprachen* was also revived, with A. Klingenberg, L. Lukas and E. Mayer as editors. The anthropological institute of the University of Frankfurt-on-Main, founded by Franz Weidenreich in 1928 but dissolved by the nazi authorities, was re-established as the Franz Weidenreich Institut für Anthropologie, with Peter Kamp as director. Adolf Jensen, director of the Froebienus institute at Frankfurt, conducted ethnological and archaeological work in southwestern Ethiopia.

A report was published in *Lidove Noviny* (Feb. 11 and 22)

on recent archaeological work in Czechoslovakia. A translation of the articles by S. E. Mann appeared in *Man* (Sept. 1951). Mesolithic discoveries in sites along the River Elbe in Bohemia, at Slánsko and at Ražice, were described; work at a neolithic site at Hluboké Mašůvky and bell-beaker settlements at Lhánice were also described.

In Yugoslavia, results of certain investigations carried out in 1950 were published in 1951 by Professor B. Skerlj in "The development of secondary school students of Ljubljana," and "Anthropometric Differences between normal and consumptive youth," and, in collaboration with J. Kastelic, he reported on an examination of early Slav skulls from Bled.

The first meeting of a new International Congress of European and Western Ethnology was held in Stockholm from Aug. 26 to Sept. 2. The East African Institute of Social Research, Makerere college, Uganda, held its first conference during Dec. 17-23, 1950, on field methods and field statistics. The West African Institute of Social and Economic Research was established at University college, Ibadan, Nigeria.

The British Association for the Advancement of Science held its annual meeting at Edinburgh. Sir Cyril Fox, in his presidential address to Section H (anthropology and archaeology), contributed a valuable and constructive dissertation on "The Study of Early Celtic Metalwork in Britain." He drew attention to the need for further and more organized study of this subject and urged the study of the evolutionary progress of patterns and of the motifs in patterns, in post-graduate research. Further, he stressed the need for an index of Celtic art, comprising a record of "all decorated examples of Celtic metal work" whether privately owned or in museums; the index, to be of maximum use to students, would need to be associated with a museum or some institution able to organize and maintain it.

J. P. Mills succeeded Professor E. E. Evans-Pritchard as president of the Royal Anthropological institute. The University of Edinburgh welcomed Ruth Landes, an American anthropologist, to its department of social anthropology. Mrs. Irawati Karvé (Poona) came to the School of Oriental and African Studies, University of London, also for a year. Elizabeth Colson gave up the directorship of the Rhodes-Livingstone institute, Northern Rhodesia, to take up appointment to the department of social anthropology, University of Manchester. Professor A. R. Radcliffe-Brown delivered the annual Huxley Memorial lecture of the Royal Anthropological institute on "The Comparative Method in Social Anthropology" (*Journal R. Anthropol. Inst.*, vol. 81) and received the Huxley medal. E. F. Fortune was awarded the Rivers Memorial medal, 1951, for anthropological field work in Melanesia and North America, J. A. Barnes was awarded the Wellcome medal for his essay "Divorce in a Changing Society," and the Curl prize essay competition (1951) of the Royal Anthropological institute was won by E. R. Leach (this was the first Curl prize to be awarded). (S. F. SN.)

Western Hemisphere. The American Anthropological association observed its 50th anniversary and the Viking fund its 10th. A volume summarizing the activities of the latter organization (now the Wenner-Gren Foundation for Anthropological Research, Inc.) was published under the title *The First Ten Years, 1941-1951*. Harvard university, through its Russian research centre, began a four-year study of the Russian people and the Soviet social system. The project, under the direction of Clyde Kluckhohn, began with the interviewing of more than 3,000 persons who had left the U.S.S.R. for various reasons. With a grant from the Rockefeller foundation, Cornell university, Ithaca, New York, broadened its programme of southeast Asia studies, directed by L. Sharp. Northwestern university, Evanston, Illinois, established an Institute on Contemporary Africa.

The South Pacific was the scene of considerable anthropological activity during the year. The South Pacific commission made a survey of the status and needs of anthropology in the Pacific islands and authorized investigation of depopulation and over-population problems and of means for assisting island peoples to play a more important part in commerce and industry in the area. The Pacific Science board of the National Research council continued its coral-atoll research programme, sending a six-man team, including Ward Goodenough, anthropologist, to make a general ecological study of the interrelationships of all forms of life, including that of the native population, on Onotoa, a heavily populated dry atoll in the southern Gilberts. Anthropological and ecological studies were carried out under the same auspices at Arna, in the Marshall Islands, by Harry Uyehara of the University of Hawaii, and by Mary Murai, who made a nutritional survey of the island of Udot in the Truk archipelago. The Peabody museum of Salem, Massachusetts, sent a two-year expedition to Polynesia, under the direction of Donald S. Marshall, to conduct ethnological work in the Cook and Society Islands, the Marquesas and Niue. Homer G. Barnett, of the University of Oregon, made ethnological studies in Micronesia as staff anthropologist for the U.S. Department of the Interior in the Trust Territory of the Pacific Islands.

Under the sponsorship of the University of Michigan Centre for Japanese Studies, Micha Titiev conducted research at Okayama on the general problem of the effect of western civilization on Japan's folk culture. Douglas Haring, Clarence Glacken and William W. Burd began anthropological work on Okinawa, Amami and Miyako, as part of the Pacific Science board's comprehensive programme of scientific research in the Ryukyu Islands. Other anthropologists working in Japan were Earl Reynolds, who studied growth problems at Hiroshima, and Allan H. Smith and Ann G. Smith, who made ethnographic studies on Yaeyama in the Ryukyu Islands.

A series of articles by anthropologists, geneticists and palaeontologists summarizing the present status of knowledge of human genetics, primate evolution, classification of fossil men and the concept of race was published in *Origin and Evolution of Man*, a volume resulting from the 1950 Cold Springs Harbor (New York) symposia on quantitative biology. Another important contribution in this field was a volume of papers on the *Physical Anthropology of the American Indian*, presented at the fourth Viking fund seminar and edited by William S. Laughlin. Joseph B. Birdsell's article, "The Problem of the Early Peopling of the Americas as Viewed from Asia," published in this volume, marked a fresh and original approach to this much-discussed question. Catherine McClellan spent a year in northwestern British Columbia working among the interior Athabaskan tribes, and Fred Hulse directed a programme of blood typing of northwestern Indians.

Adolph H. Schultz resigned from Johns Hopkins university, Baltimore, Maryland, to become professor of anthropology and director of the Anthropological institute, University of Zürich. Gordon T. Bowles went to Tokyo as visiting professor of anthropology. Viking fund medallists for 1951 were Clyde Kluckhohn for ethnology; W. M. Krogman, physical anthropology; and Emil W. Haury, archaeology.

The *Ethnographic Survey of Africa*, edited by Daryll Forde, continued its series of concise ethnographic accounts of African peoples with *The Southern Lunda and Related Peoples*, by Merran McCulloch; *Bamba and Related Peoples of Northern Rhodesia*, by Wilfred Whiteley; *Akan and Ga-Adangbe Peoples of the Gold Coast*, by Madeline Manoukian; and *Peoples of the Lower Luapula Valley*, by J. Slaski.

ARABIA. Peninsula of southwestern Asia (area c. 1,071,300 sq.mi.; total pop. est. 9,500,000). It consists politically of two independent Arab states, Saudi Arabia and Yemen (*q.v.*); the independent sultanates of Oman and Masqat or Muscat; the autonomous sheikhdoms of Bahrein, Kuwait, Qatar and the Trucial sheikhdoms; and Aden colony and protectorates (*q.v.*). Language: Arabic. Religion: Moslem (Sunni).

Saudi Arabia. Area: c. 597,000 sq.mi. (excluding the Rub al-Khali desert covering approximately 193,000 sq.mi.). Pop. (1947 est.): 6,000,000. Chief towns: Riyadh (cap., 60,000); Mecca (150,000); Medina (45,000); Jeddah (40,000); Hufuf (31,500). Ruler, King Abdulaziz ibn Abdurrahman ibn Faisal Ibn Sa'ud; viceroy of Nejd and commander in chief, Emir Sa'ud, crown prince; viceroy of Hejaz and minister of foreign affairs, Emir Faisal, king's second son.

History. Throughout 1951, the Saudi Arabian government participated in the deliberations of the Arab league and in January signed the Arab league security pact (see ARAB LEAGUE). In October its delegate attended a meeting in Cairo called by the Egyptian minister of foreign affairs to discuss the Arab implications of Egypt's denunciation of the Anglo-Egyptian treaty of 1936 and of the Sudan condominium convention of 1899. In April the Saudi Arabian government publicly expressed its sympathy with Syria during the Israeli-Syrian outbreak on the Jordan.

In June the appointment was announced of A. N. Young, an American financial expert, to the post of financial adviser to the Saudi Arabian government and on June 18 an agreement was signed between the government and the United States dealing with the use and development of the Dhahran airfield serving the oilfields of the Arab-American Oil company (Aramco) in the gulf province of Hasa. By it the Saudi Arabian government assured to the U.S. government the continued use of the Dhahran airfield in return for which the United States would assist Saudi Arabia with the supply of military equipment and in the training of Saudi Arabians in its use. The agreement stipulated that the Dhahran airfield would not be converted into a U.S. base. It was accepted however that facilities could be prepared for its use in wartime.

At the end of the year Aramco started commercial production at Ain Dar, also in the Hasa province, where in 1948 eleven new oil wells had been brought into bearing.

In August Emir Faisal visited London where he had discussions with the British government regarding the fixing of the boundary between Saudi Arabia and the British protected sheikhdoms along the Trucial coast at the southwestern end of the Persian gulf. The ownership of certain islands and sea-bed shores along the Persian gulf was also discussed.

On Oct. 24 the four powers—Great Britain, France, Turkey and the United States—communicated to the Saudi Arabian government their plans for the organization of an international command for the defence of the middle east. On the rejection of these proposals by Egypt, the four powers informed the Saudi Arabian government that their defence plans in the middle east would nevertheless proceed.

On Nov. 10 King Talal of Jordan arrived in Jeddah on an official visit to King Ibn Sa'ud. (O. Tw.)

Education. Schools (1950): primary 30, secondary 5; pre-university 1. **Agriculture.** Dates form the main crop but there is a small production of wheat, barley, limes and coffee. Principal livestock are camels, horses, donkeys and sheep.

Industry. Crude oil production ('000 metric tons, 1950; 1951, six months, in brackets): 26,904 (16,381). Raw materials: copper (metric tons, 1948) 67; gold (troy ounces, 1949; 1950 in brackets) 66,835 (66,202); silver (troy ounces, 1949; 1950 in brackets) 81,295 (124,287).

Foreign Trade. Main imports; textiles, cereals, tea, coffee, sugar, rice and motor vehicles. Main exports: oil, gold concentrates, hides and skins, gum, dates and clarified butter.

Transport and Communications. Roads (1948) metalled, 45 mi. Licensed motor vehicles (Dec. 1950): cars 6,000; commercial 7,700. Telephones (1946), 2,500. Radio receiving sets (1949), 9,000.

Finance. Pilgrimage dues (1948 est. £10 million) and oil royalties (1948 est. over £20 million) are the main sources of revenue. Monetary unit: *riyal*; there is no fixed exchange rate but in Nov. 1950 it was 8·14 riyals to the £.

Oman and Muscat. Area: c. 65,000 sq.mi. Pop. (1947 est.): 830,000. Capital, Muscat. Ruler (from 1932), Sultan Said bin Taimur. British consul, Major F. C. L. Chauncy.

A new treaty of friendship, commerce and navigation was signed at Muscat on Dec. 27 by the sultan and Sir Rupert Hay, British political resident in the Persian gulf. The treaty, which displaced a treaty of 1939 expiring on Dec. 31, would

The second son of King Ibn Sa'ud, Emir Faisal, foreign minister of Saudi Arabia, seen here during a visit to London in Aug. 1951.

remain in force for 15 years. Britain retained extra-territorial rights, by which British citizens were entitled to trial before British consular courts.

Bahrein. Area: 213 sq.mi. Pop. (1947 est.): 125,000. Ruler: Sheikh Sulman bin Hamad al Khalifah. British political agent, C. J. Pelly.

Crude oil production ('000 metric tons, 1949; 1950 in brackets): 1,500 (1,500).

Kuwait. Area: c. 9,000 sq.mi. Pop. (1949 est.) 120,000. Ruler, Sheikh Abdullah bin Salim as-Subah. British political agent, H. G. Jakins.

Crude oil production ('000 metric tons, 1950; 1951, six months in brackets): 17,018·6 (13,636·7).

Qatar. Area: c. 4,000 sq.mi. Pop. (1947 est.): 25,000. Ruler, Sheikh Ali bin Abdullah al-Thani.

Crude oil production ('000 metric tons, 1949; 1950 in brackets): 100 (1,600).

Trucial Sheikdoms. Area: c. 16,000 sq.mi. (including the sheikdoms of Sharjah, Ras al-Khaimah, Umm al-Qawain, Ajman, Dubai, Abu Dhabi and Kalba). Pop. (1947 est.): 115,000.

ARAB LEAGUE. The League of Arab States came into being on March 22, 1945, when its covenant was signed in Cairo by the representatives of Egypt, Iraq, Lebanon, Saudi Arabia, Syria, Transjordan and Yemen. The council of the league, on which each member had one vote, had its seat in Cairo. The main object of the League was stated to be to co-ordinate the political action and safeguard the independence and sovereignty of the Arab states. Secretary general, Abdurrahman Azzam Pasha.

After its first session of the year in Jan. 1951 the Arab league published a communiqué (1) that the league understood its obligations under the United Nations charter and would do everything possible to ensure world peace; but that whole-hearted co-operation was impossible while Arab national aspirations remained unsatisfied and while military and economic assistance was not forthcoming for the organization by each member of its national defences; (2) that a collective security pact had been signed by all members except Jordan, which had put forward alternative proposals, while Iraq had asserted its liberty not to be bound by the league in financial matters and the Yemen had maintained its former reservations; (3) that the league unanimously accepted a policy for the settlement of the Arab refugees from Palestine in those countries where they had fled, but without prejudice to their rights to repatriation and compensation; the league would co-operate with the U. N. Refugee organization which, it hoped, would provide more funds for re-settlement schemes; (4) that the league placed on record a unanimous resolution denouncing French intervention in Morocco, and that the Egyptian government would send a note to the French government urging the grant of independence to Morocco; (5) that, through the Egyptian government, the league would closely study the progress towards Libyan independence to ensure the fulfilment of the United Nations' decision that Tripoli and Cyrenaica should be fully independent by Jan. 1, 1952.

Later in the year (Sept. 19) the secretary general of the league stated that it opposed the retention of British troops in Cyrenaica and Tripoli after these countries had achieved their independence.

On May 14, at the time of the Israeli-Syrian clash on the upper Jordan, the Egyptian foreign minister, Salah ed-Din Pasha, attended a league meeting in Damascus.

In July the Egyptian government ratified the Arab league security pact and on Sept. 3 the league in session recorded its support for Egypt in its rejection of the United Nations' resolution dealing with Suez canal oil traffic to Israel. The league maintained Egypt's right to self-defence under this

heading and rejected the implication that the United Nations could override Egyptian sovereignty on this issue. It was also resolved to maintain the total Arab boycott of Israel.

On Sept. 10 the U.N. Palestine Conciliation commission met in Paris. Representatives of Israel, Syria, Jordan, Lebanon and Egypt attended. Proposals for a settlement included war damages; the repatriation by Israel of a specified number of Arab refugees, the remainder to be compensated by Israel on a scale fixed by the commission; the demarcation of the Israeli frontier; the creation of a free port at Haifa and of an international water authority to adjudicate the problems of the Jordan and the Yarmuk rivers and Lake Tiberias; and the organization of facilities of access to the Holy Places in Jerusalem and Bethlehem. On Sept. 25 the Arab delegations rejected the proposals and on Nov. 21 the commission announced the failure of its efforts.

On Oct. 24 Great Britain, France, Turkey and the United States communicated to the other members of the Arab league their invitation to Egypt to participate as an equal partner in a middle east defence command. Egypt refused and on Oct. 29 the four powers announced that, despite Egypt's refusal, the defence plans would proceed.

On Nov. 10 Abdurrahman Azzam Pasha, speaking before the U.N. Security council in Paris, criticized the joint defence plan as being unilateral action which was inconsistent with United Nations principles and as ignoring the Arab league and its joint military pact integrating Arab forces under unified Arab command. (See also ISLAM.) (O. Tw.)

ARCHAEOLOGY. **Great Britain.** Work continued at the mesolithic settlement of Seamer, Yorkshire. R. J. C. Atkinson and N. Thomas excavated the prehistoric sanctuary known as Big Rings near Dorchester, Oxfordshire. The earth-work, which had been interfered with during the iron age, was found to have points of resemblance with the circles at Hilton Moor and Thornborough, Yorkshire. At Stanton Harcourt, N. Thomas excavated, in the neolithic area, a superimposed Romano-British farm-settlement, which yielded mainly 1st-century and 2nd-century finds. R. E. M. Wheeler began the excavation, for the Ministry of Works, of the Brigantian stronghold at Stanwick in the North Riding of Yorkshire, the principal centre of that tribe at the time of the Roman conquest and city of Cartimandua, the betrayer of Caratacus. Work was concentrated on the massive defences (which, with their annexes, protected over 700 ac.). They were of earth, with dry-stone revetment. Finds included native pottery of typical Yorkshire type, pottery attributable to the time of the campaigns of Petilius Cerialis and a perfect specimen of an iron age sword still in its scabbard. Other iron-age sites examined included Sutton Walls, three miles northeast of Hereford, where some 20 skeletons were found; and Meare, Somerset, where dwelling-mounds in the eastern of the two lake-villages produced quantities of iron-age "B" pottery.

At Canterbury further digging directed by S. Frere cleared more of the monumental structure previously found and confirmed its resemblance to a large curving corridor (presumably of a theatre). Other finds were a cemetery, the position of which agreed with the siting of a Roman road from the Queningate to the port of Richborough, and a 9th-century Saxon house. Later discoveries included the disclosure, beneath the bombed cathedral library, of the dormitory sub-vault, a building some 135 ft. long, erected by Lanfranc in 1080. In the River Eden near Carlisle, Cumberland, massive bridge foundations were discovered during dredging-work. They carried the Roman wall supply-road from the military cohort-fort at Stanwix (*Petrianas*) to the depot-town at Carlisle (*Luguvallium*). In Dorset I. A. Richmond and

The site of the excavations near Piazza Armerina, in Sicily, where a large Roman villa of the 4th century was uncovered.

J. P. S. Bradford continued their excavations at Hod Hill, an iron age hill-fort with a Roman fortlet, thought to be of the conquest period, in one angle. The iron-age inner rampart was found to be of two periods, the second probably an extensive repair. Further work by D. Smith at Malton, Yorkshire, where Roman buildings had been previously examined south of the fort, produced a series of early timber buildings. Later massive stone buildings were associated with much painted wall-plaster. J. Wenham excavated part of a Roman cemetery at the Mount, two miles south of York; it was probably the richest in Great Britain to have been scientifically excavated.

During the restoration of the bombed nave of All-Hallows-Barking-by-the-Tower, London, part of an inscribed circular cross-head, attributed stylistically to the late 10th or early 11th centuries was found. This fragment, with that of a large sculptured cross-shaft, found some years before, could perhaps be associated with the establishment of Canute's sovereignty in 1017.

Shetland. The continued exploration by the Ministry of Works of the site of Jarlshof was reported by J. R. C. Hamilton. The site, already famous for its bronze-age and iron-age remains, was later settled by a small, possibly Christian, group of Picts, who lived in large round huts. They were succeeded c. 800 by Viking settlers, who built typical "long houses" some of the features of which survive in existing Shetland dwellings. The Viking occupation, which lasted well into the middle ages, was based on fishing and mixed farming. A large collection of associated objects was found.

Europe. Czechoslovakia. Recent work was briefly recorded in *Archeologické Rozhledy*, III (Prague, 1951). The main items reported were: mesolithic sites at Ražice, southern Bohemia, and Tachlovie, western Bohemia; a bronze-age cemetery near Holechov, Moravia; an iron age site at Nezdžev, near Blatnc; first-century and second-century Roman graves at Mikulová, Moravia; and several interesting early Slav sites.

France. Professor D. A. E. Garrod and Suzanne de Saint-Mathurin continued their exploration of the Angles-sur-l'Anglin (Vienne) rock-shelter, which now appeared to have

been of much greater extent (over 100 ft.) and to have had a continuous frieze of human and animal figures of early Magdalenian (Mag. III) date; an occupation-layer yielded hearths, bones and artifacts of that period. Much of the frieze, especially its upper part, had fallen away in very ancient times, but many of the figures were capable of reconstruction. Though the human figures were the most interesting carvings of horses were most numerous—a significant fact in view of the predominance of horse-bones associated with the occupation-layer. The carvings could be paralleled; e.g., in the Dordogne, but the extent and quality of the new discoveries suggested that other work of this character might well exist in central France.

Germany. Further discoveries on bombed sites made at Trier by Dr. Kempf and Dr. Eiden produced important traces of the Constantinian epoch of *Augusta Treverorum*. They reported that the basilica was in fact the imperial throne-room from the time of Constantine the Great and that the cloister of St. Irmina represented a granary complex, perhaps of late 3rd-century date, which served both military and civilian uses. A large mosaic pavement displayed an interesting admixture of Christian and pagan figure-subjects. Other finds were a filigree glass vessel of an extremely rare type, found with a 4th-century coin in a sarcophagus near Niederremmel, ten miles from Trier; and an important hoard of parade-armour at Straubing in Bavaria. This, of 2nd-century or 3rd-century date, was probably ceremonial regimental armour looted, or buried for safety, during the mid 3rd-century German invasions. Of thin gilded or silver bronze, it included visor-masks, greaves and horse-frontlets, many decorated in incised or repoussé technique with figures of gods, heroes, etc. Figure subjects and ornaments showed some mixture of styles and displayed eastern features; a lower Danubian provenance was suggested. (See J. Klein and H. Klumbach, *Der Romische Schatzfund von Straubing*, Munich, 1951).

R. Schindler reported on investigations (1949-51) of the precinct and neighbourhood of the ancient cathedral of Hamburg, in particular of its earliest and latest forms and of its relation to the history of the neighbourhood. The famous early church (*ecclesia miro opere*) was built by St. Ausgar and was destroyed by the Danes in 843, being rebuilt in the 11th

century. The latest building was of various dates from the mid-13th century to the late Gothic period. It was demolished 1805-6. Excavations revealed traces of an early wooden building, possibly the early church, and of what may have been the original enclosure of the precinct, encompassed by a ditch and a timber-revetted earth rampart. Finds included a useful series of late Saxon potsherds, including hand-made stamped and incised wares of local type (see *Hammaburg*, 11, vol. v/vi, Hamburg, 1951).

Greece. The American School of Classical Studies in Athens, under H. A. Thompson, continued its exploration of the Agora, in the north of which a Mycenaean chamber-tomb yielded a superb bronze vase (c. 1600-1100 B.C.). Its quality suggested some reassessment of the cultural importance of Athens in the Mycenaean age.

Italy. Further work by G. Jacopi at the Magna Graecia city of Sybaris in Calabria showed its extent to be about 100 ac. and produced traces of a Greek theatre. At Paestrum (*Praeneste*), 23 mi. east of Rome, excavations continued on the site, cleared by bombing, of the ancient Temple of Fortune. Though many of its features, especially its lower storey, were known from the time of Andrea Palladio (1518-80), its upper portion was obscured by later buildings largely destroyed by bombing in World War II and being removed by the Ministry of Fine Arts. This removal revealed much of the grandiose reconstruction of the temple carried out by Sulla.

In Sicily, G. Gentili continued the excavation (for the Sicilian regional government) of the large 4th-century Roman villa at Casale, near Piazza Armerina. The villa site, which, it was suggested, had been occupied until Norman times, was of great extent and included a long narrow hall which was decorated in mosaic with figures of wild beasts and of hunters in Byzantine costume. Apart from the great general interest of the finds as exemplifying a gradual transition from Late Roman to Byzantine art, the villa was noteworthy for its series of coloured mosaic pavements, which displayed a wealth of figure-subjects, including the Labours of Hercules (an earlier discovery) and Orpheus and his lute, with a large collection of fauna, female gymnasts and a vast and elaborate hunting-scene of impressive design.

Sweden. At Kvarnby, near Malmö, Carl-Axel Althius investigated an ancient pit in a chalk-quarry containing, among many fragments of flint, two small blades, ox and sheep bones, part of a shed antler and quantities of potsherds of late-Roman/iron age date. The investigation and study of comparative material suggested that the chalk-pits of the district were not necessarily flint-mines (see *Arsherattelse*, Lund, 1951). At Lilla Loshult, about 30 mi. north of Kristianstad, a chance find produced a quantity of fragments of arrow-shafts, in one of which were embedded two microliths, one as point, the other as barb.

Near and Middle East. Crete. A. J. B. Wace reported the resumption of digging at Mycenae and investigated two house-sites. Both had cellars containing the remains of stamped wine-jars. One incorporated some earlier work; the other had apparently been destroyed before 1200 B.C.

Cyprus. At Enkomi more work by C. Schaeffer further elucidated the history of the Achaeans. In the middle of the 14th century B.C. they conquered the island and built the palace of Enkomi. It was destroyed c. 1200 B.C. by iron age invaders. Rebuilt on a humble scale, it was finally abandoned in the middle of the 11th century. Among the bronze objects found were statuettes of goddesses and a gilt-bronze Egyptian figure. In its second year's work at Old Paphos a joint expedition of Liverpool and St. Andrews universities examined a great stone-built mound, which was found to overlie several rock-cut tunnels. Nearby a monumental wall of draughted blocks, backed by a mud-platform, was probably built before 500 B.C., and was perhaps a temple. At Kouklia late

prehistoric (late bronze-age) finds were made under a Roman house. Other finds included tombs of chalcolithic, geometric and archaic periods. (See *Bulletin of the Liverpool Libraries, Museums and Art Committee*, Liverpool, 1951).

At Pigadhes, near Myrtou, Miss J. du P. Taylor and Miss Seton Williams continued the excavation of a late bronze-age sanctuary. Fragmentary traces were found of an earlier (middle bronze age) occupation. This was followed in c. 1500 B.C. by a group of stone buildings with earth floors, later enlarged with buildings of squared rubble walls and plaster floors and with a store-house, in which were found a group of sanctuary vessels—two ring-stands, three bronze tripods and a Mycenaean rhyton of c. 1300 B.C. In the following century these buildings were incorporated in the great sanctuary courtyard, found in 1950. The latest occupation found was of the early iron age. Tombs examined at Stephanía proved rich in finds of from mid to late bronze-age date.

Iraq. M. E. L. Mallowan continued the excavation of the mound at Nimrud, the great Assyrian city and army centre, 20 mi. north of Mosul, on behalf of the Department of Antiquities and the British School of Archaeology, Iraq. The most striking results came from the examination of the palace of Assur-nasir-pal II (884-859 B.C.), the source of the sculptures found by Sir A. Layard and now in the British museum. Outside the north entrance of the palace was found *in situ* a large monumental slab, carved in low relief with the figure of the king in full regalia and symbols of Assyrian deities. It also bears a long and very important inscription (dated 879 B.C.), a remarkable social document which gives, *inter alia*, a detailed list of the temples and public works executed by the king and some account of festivities, in which 69,574 people are stated to have participated, which marked the completion of the palace. Two large rooms excavated in the same area were probably a store-room and a guard-house. Areas partly dug by 19th-century explorers again proved fruitful; there were fine ivories from the king's audience chamber and others, with fragments of frescoes, from near the palace foundation-stone, found by Layard and now re-excavated. The rich discoveries of ivories were not confined to these earlier examples associated with Assur-nasir-pal; another large collection, of perhaps a century later, was secured from the southeast corner of the mound, where W. K. Loftus's finds were made in the 19th century. The buildings of this area, which included a great hall, which had contained frescoes, were standing high, but had been burnt, it was suggested, in 705 B.C. The many ivories, though damaged by fire and broken, were of exceptional interest for their quality, variety of subject and for their Phoenician treatment of Egyptian elements and motifs.

North Africa. The Roman Map of Libya committee completed its work. The discoveries of its executive party included the site of Berenice (Euhesperides) near Benghazi and an imposing Diocletianic border-monument on the western confines of the Roman province. At Leptis Magna an impressive restoration of the great theatre was carried out and J. B. Ward Perkins continued the investigation of the growth and character of the city. At Sabratha Kathleen Kenyon excavated earlier levels beneath the Roman city, finding remains of mud-brick buildings, associated with distinctive pottery-types. One level could be assigned to the 5th century B.C. by association with Greek decorated wares of that date, but earlier sherds were also found of a type common in Palestine in the 7th and 8th centuries B.C. The Antiquities Department of Cyrenaica reported the discovery by C. N. Johns of the site of the first Cyrenaican Greek settlement at Azaris, 30 mi. north of Derna. Surface examination suggested that the settlement took the form of a promontory fort.

Turkey. The Turkish Department of Antiquities and the

British Institute of Archaeology at Ankara joined in the investigation of monuments near Harran in southeastern Turkey, believed to be one of the centres of the Mesopotamian moon-cult. It was an important Assyrian stronghold, was sacked by the Medes and Persians in the 7th century B.C., but rebuilt by Narbonidus. It flourished under the Romans especially during the early Empire and under Islam was occupied by the pagan Sabians. The main work (directed by Nuri Gokçe and Seton Lloyd) was the sounding of the imposing mound of Sultantepe. A large 7th-century or 8th-century Assyrian building was partly cleared and near it a large repository containing many inscribed tablets, mainly standard texts, was briefly examined. Search for the moon-temple was hampered by the great depth of rich deposits. In the city D. Storm Rice excavated part of the mediaeval castle, uncovering a black basalt gateway, carved with hounds, and fragments of an inscription dated A.D. 1059. In Istanbul work continued in St. Sophia. Discoveries there included mosaics of St. John Chrysostom and the patriarchs of Constantinople and Antioch and an earlier series (c. A.D. 900) of Christ in majesty flanked by the Virgin and St. John and by the apostles, and patriarchs with prophets and saints. Of particular artistic and iconographic interest were the early 14th-century lunettes of the life of Christ in the Chora narthex, uncovered and repaired by P. Underwood for the American Byzantine institute.

Further work at Kültepe, directed by Tahsin Ozguç, was divided between the outer town, the site of the large Assyrian

trading enclave and the Anatolian town on the great mound. In the former, the character of the four main periods (c. 2000-1700 B.C.), recognized in the previous excavation, was further investigated. The latest (period 1) was seen to have been divided into two, it was suggested, by a great fire occurring at about the beginning of the 18th century B.C. and ending the century-old Assyrian colonization. The town was rebuilt shortly afterwards, in general on the same lines. Remains of the hey-day of the Assyrian epoch were found to be well preserved and finds, especially of pottery (which included a fine series of *rhyta*) and epigraphic relics, abundant. The coincidence of native Anatolian and foreign Assyrian elements was striking. In the native area on the great mound the earliest level encountered was ascribed to c. 1200 B.C.; the latest, represented by the remains of a small fortified town, to the 1st and 2nd centuries B.C.

East Africa. A survey was made by G. Mathew and excavations undertaken by J. Kirkman among the coastal and inland settlements of the Tanganyika and Kenya seaboard. Of the earliest occupations noted, one had a somewhat poor Islamic culture, and dated from the 9th century onwards; another was clearly non-Islamic. Late in the 13th century there arose, particularly among the Kilwa islands, a civilization, originally Islamic, which, prospering greatly in this entrepôt of middle and far eastern trade, spread to most of the East African islands and developed its own distinctive culture during the next two centuries. Next came a period of Portuguese dominance, followed in the 17th and 18th centuries by the rise of a series of smaller trading communities. Substantial remains had been located, including those of mediaeval mosques on Kilwa and of a very complete mediaeval town on Songo Mnara. Near Lake Chad at Tago, J.-P. Lebeuf and Mme. A. M. Detourbet explored the region occupied during the middle ages by the Sao people, whose grave-goods suggested that they were experts in bronze casting. (See E. Guernier and G. Froment-Guiesse, ed., *Afrique Equatoriale Française*, Paris, 1951.) (J. CHN.)

North America. W. F. Libby and J. R. Arnold of The University of Chicago announced the results of their work on the age determination of archaeological and geological specimens by the Carbon ¹⁴ technique. (See *Science*, 113: 2927, pp. 111-120, Washington, Feb. 2, 1951.) The significance of this series of dates and the degree of correlation with archaeological chronologies were discussed in a symposium published as memoir no. 8 of the Society for American Archaeology.

With the new device of radiocarbon dating, the archaeological studies of early man in North America were beginning to form a consistent pattern and also to assist in dating the last glacial maximum. Robert F. Heizer secured bat guano from the lower levels of Leonard rock shelter near Lovelock, Nevada. This was mixed with gravels of a beach of Lake Lahontan and gave a date of 11,199 ± 570 years ago. Other dating for the Manketo maximum fell between 11,000 and 12,000 years ago and demonstrated that man was already in North America as the continental glaciers began to wane. Several radiocarbon dates were obtained for the Eskimo archaeological sequence. Wood from a house at Gamble, St. Lawrence Island, Alaska, assigned to the Old Bering Sea I or Okvik period, gave a date of 2,258 ± 230 years. Two dates were obtained for the Ipiutak period: one from the type site at Point Hope, Alaska, was 912 ± 170 years; the other, from a site near Deering on Seward peninsular, was 973 ± 170 years.

Test excavations were made at Musqueam near the mouth of the Fraser river by Charles E. Borden of the University of British Columbia. The deposit was more than 11 ft. deep and extended well below the water table; unusually well-preserved perishable material was discovered and excavations on a larger scale were planned for this site.

The site of the new library of Canterbury cathedral where in 1951 a row of columns forming part of the dormitory of the cathedral built by Lanfranc, archbishop 1070-1089, was uncovered.

At the mouth of Willow creek, Monterey county, California, a site consisting of two shell midden layers separated by ten feet of water-laid gravel was excavated by Robert F. Heizer and ten students from the University of California. There was cultural difference between the layers and evidence of subsidence of the coast since the lower midden was deposited. A radiocarbon date from this level was $1,879 \pm 250$ yr. ago.

The University of Colorado field session, under the direction of Robert H. Lister, excavated two caves and several open sites south of Grand Junction, Colorado. The refuse in one of the caves contained pottery, but the other was entirely pre-ceramic. Several of the open sites were deeply buried and apparently rather old. H. Marie Wormington of the Denver Museum of Natural History directed a party in the excavation of a rock shelter in the same vicinity as the University of Colorado excavations. Occupation debris extended to a depth of 13 ft. and contained a wide variety of projectile point types. The pre-ceramic, pre-agricultural culture was similar to that found in two shelters in Montrose county, Colorado, in 1938 and 1939.

Charles DiPeso of the Amerind foundation excavated at the historic site of Quiburi and discovered a number of Spanish metal objects associated with Indian artifacts. The University of Arizona field school, under the direction of Emil Hauray, continued work at Point of Pines on the San Carlos Apache reservation. A series of sites was examined ranging from early Mogollon to late Pueblo remains, dating from the 14th or 15th centuries.

The River Basin surveys of the Smithsonian institution had eight major field parties working in the Missouri basin in the summer of 1951: seven were engaged in the excavation of selected sites in areas to be flooded, and one party continued survey. Work in the Keyholes reservoir of eastern Wyoming was conducted by a Smithsonian party, and also by a second group headed by William T. Mulloy of the University of Wyoming. One of the three sites excavated by Mulloy yielded artifacts similar to Signal butte II. Two Smithsonian excavation parties worked in the Garrison reservoir area in North Dakota. One of these excavated Fort Stevenson, a frontier military post of the 19th century, and the other worked on pre-historic Indian sites. Indian contact-period sites were excavated in several other reservoir areas further down the Missouri valley. The Nebraska State Historical society field party, under the direction of Martin Kivett, worked in South Dakota in the Fort Randall reservoir at an earth lodge village site. The contents of the houses suggested a culture related to the Lower Loup and the Talking Crow site.

The first group of Carbon ¹⁴ dates released for sites in the eastern half of the continent contained several surprises. Hopewell culture specimens from Ohio and Illinois dated between 386 and 1 B.C., and dates for related Marksville period sites in Mississippi and Louisiana were A.D. 674 and 792. Adena sites of Ohio and Tchefuncte sites of Louisiana, thought to precede the Hopewell-Marksville culture in time, produced later dates. Early Archaic sites in Kentucky and New York gave approximately equal dating measurements of about 5,000 years elapsed time. An old buried fishweir excavated from beneath Boylston street in Boston several years earlier gave about the same measurement.

The New York Science service and the State museum excavated sites in central and northern New York state. An early Laurentian site was dug on the upper Hudson river near Schuylerville, and near Catskill in the same valley a late Laurentian site was examined. The Carnegie museum of Pittsburgh was conducting an extensive survey of Pennsylvania under the direction of William J. Mayer-Oakes. Several mound sites had been discovered, and examination of local collections suggested Hopewellian and Adena-Middlesex influences.

A poster, designed by Brian Hope-Taylor, issued in 1951 by the Council for British Archaeology.

The University of Georgia field session, under the direction of A. R. Kelly, worked on a late Kellogg and early Cartersville period site on Pine Log creek in northern Georgia. Several caves were found containing cultural material with Copena relationships. W. Sears continued excavation in Kolomoki State park in southern Georgia and uncovered a number of burials accompanied by Weeden Island-type artifacts.

A joint field party from the American Museum of Natural History and Peabody museum, dug at the Jacketown site near Belzoni, Mississippi. Beneath natural levee deposits of an old course of the Ohio river, a pre-ceramic cultural complex was found which corresponded to that described from Poverty point, Louisiana.

Central America. Under the direction of the Instituto Nacional de Antropología y Historia, the Mexican government had begun an extensive programme of restoration at the major sites of Chichen-Itza, Palenque, Tajin, Uxmal and Cahab. The annual round-table conference on Meso-American anthropology was held in July at Jalapa, Veracruz, and the subject of discussion was "The Totonac, Huastec and Their Neighbours." The conference was well attended and the stimulating discussion dealt with both ethnological and archaeological aspects of the problem. Radiocarbon tests from Archaic period sites in central Mexico ranged from 3,400 to 2,400 years ago. Apparently the earliest pyramidal mounds dated about 500 B.C.

The Museo de Arqueología y Etnología of Guatemala announced the formal inauguration of its sherd laboratories. Comprehensive files had been arranged representing the results of the work of the Carnegie institution, the Philadelphia museum and a number of private individuals.

South America. In Colombia the Instituto Etnologico Nacional, under the direction of Luis Duque Gomez, excavated a late Chibcha site on the Hacienda Mondonedo, Municipio de Mosquera, in Cundinamarca. In the site there was a mound, on top of which were found the outlines of a ceremonial building made of wood. Ross T. Christianson completed excavations in the Piura valley in northern Peru. A habitation site at Chusis, about 400 m. square, was examined by means of stratigraphic tests in the refuse and a fairly simple culture was discovered showing no relationships to Inca or Mochica. Radiocarbon dates for the north coast Peruvian sequence were summarized by Junius Bird in the memoir of the Society for American Archaeology referred to above. These data suggested that the pre-ceramic Huaca Prieta site in Chicam valley was settled about 2550 B.C. and that the earliest ceramics, the beginning of the Guañape period, dated about 1225 B.C. (J. A. F.)

ARCHERY. The Fédération Internationale de Tir à l'Arc decided that world championships would only be held in alternate years from 1950. There was therefore, no world championship held in 1951. The governing body in Great Britain, the Grand National Archery society, adopted a new constitution and appointed self-governing regional societies through which archery clubs would become affiliated to the G.N.A.S. The executive committee of the G.N.A.S. was replaced by a national council to which the regional societies each became entitled to elect two members. Regional societies, in turn, began to sponsor the formation of county associations of clubs in their areas.

The 98th meeting of the Archers of the United Kingdom (the British national championships) was held by the G.N.A.S. at Oxford in July. The results were, ladies: highest score, Birgitta Bange (Stockholm, Sweden), 1,218; Mrs. Marion Felix (Yeovil, Somerset) won the British championship with 1,182; second, Mrs. T. H. Fisher (Portsmouth), 1,181. The gentlemen's results were, first: J. B. Arch (Grantham, Lincolnshire), 1,360; second, F. L. Bilson (London), 1,300; third, T. C. Morgan (Shrewsbury), 1,249. Both the ladies' and gentlemen's county team championships were won by Yorkshire. (C. B. E.)

See A. E. Hodgkin, *The Archer's Craft* (London, 1951).

ARCHITECTURE. The Festival of Britain South Bank exhibition (May 3-Sept. 30) alone made 1951 an historic year for contemporary English architecture. Though none of the buildings in themselves was of revolutionary significance, most of them showed imagination, daring, wit and ingenuity. All informed critics agreed that the important aspect of the exhibition was the *ensemble*—the brilliant handling of informal spaces, the way in which the buildings were related one to the other and the skilful incorporation of such historic landmarks on the north bank as the Palace of Westminster, Whitehall court, Somerset house and St. Paul's cathedral, thus giving to what was in fact a very small site (27 ac.) an appearance of great spaciousness. The only permanent building on the South Bank, the Royal Festival hall, was opened by King George VI on May 3. Since it had to be designed and erected to a close timetable (the actual construction took just under two years) the architects (R. H. Matthew and J. L. Martin with Edwin Williams and Peter Moro as senior and associate architects respectively) avoided structural experiment. The framework was of reinforced concrete with panel infilling, except for the auditorium which had double reinforced concrete walls, each 10 in. thick, with a 12-in. cavity between. The floor and roof of the auditorium were also double, the latter being constructed in the shape of a tied concrete barrel vault supported on the inner wall. The finishes were exceptionally

The side elevation of part of the "unité d'habitation" at Marseille designed by Le Corbusier.

fine and well-detailed and included the wide use of Derbydene stone, highly polished on the foyer, restaurant and staircase walls and unpolished for floors—which were also of teak, cork and *muhimbi* (a hardwood from Uganda). Exterior facings were of Derbydene stone, Portland stone and tiles. All the furniture, carpets and fabrics were specially designed for the building.

At Lansbury, Poplar, in the East End of London was held the Festival of Britain "live architecture" exhibition. The development of this 30-ac. site represented the first instalment of the County of London plan. It would form a quarter of the final Lansbury neighbourhood, which would itself be one of 11 neighbourhoods in the reconstructed Stepney-Poplar district. The two chief buildings in it, completed in 1951, were a primary school designed by F. R. S. Yorke, E. Rosenberg and C. S. Mardall and a Congregational church by Cecil Handisyde and D. Rogers Stark.

A large factory designed by the Architects Co-operative Partnership was completed at Brynmawr, Breconshire. The main building included a production floor of about 77,000 sq.ft. This floor was a flat slab supported on columns at 19 ft. 1½ in. intervals which in turn were supported on piles. The roof was made up of nine domes of reinforced concrete shell-construction 3 in. thick, covering an area measuring 70 ft. by 90 ft., and supported by a reinforced concrete girder at each edge. The crown of each dome was about 8 ft. above the springing, and the curved surface was formed by two radii, that in the longer direction being 108 ft. and that in the shorter direction 82 ft. 9 in.

A housing scheme in Busaco street, London, for the Finsbury Borough council was completed to the designs of Lubetkin, Skinner and Drake ("Tecton"). This scheme, which comprised 270 flats (95 would be built later) showed in its design a further development of the principles which this firm of architects had been developing over a number of years starting at Highpoint, Highgate, in 1935. Their aim was, while using reinforced concrete construction, to free

"the elevations of their structural burden, to introduce a richer, three-dimensional treatment, combined with the use of different materials and colours." By employing, at Busaco street, a method of construction introduced into this country from Denmark after World War II and sometimes called the box-frame system, the architects eliminated, as they also did at the Spa Green flats, Islington, (where the system was first used in England) all projecting stanchions and beams; for by it the walls themselves did the work of stanchions and beams.

Of the buildings completed in the new towns, the most interesting were the blocks of flats known as The Lawn, which would form part of the Mark Hall North neighbourhood of Harlow new town. The architect was Frederick Gibberd, and the scheme comprised two blocks, one three storeys high and the other ten, both so placed (on high ground) as to form the pivot to the design of the whole housing area. The ten-storey block had a reinforced concrete frame, with external walls of 14-in. brickwork, and the three-storey block had load-bearing brick walls, 14 in. to the first floor level with 11-in. cavity walls above. Both buildings were faced with bricks of different kinds, which were laid in various types of bond to give contrast in colour, surface pattern and texture.

Results were announced of the competition for the new Coventry cathedral. The architect of the winning design was Basil Spence. In addition to the new cathedral itself with its chapter house and chapels, there would be a Christian Service centre. It was also proposed to retain the existing cathedral in its ruined state as a garden of rest with an open-air pulpit and stage within the walls.

In July the eighth of the annual Congrès Internationaux d'Architecture Moderne was held at Hoddesdon, Hertfordshire. The theme was "The Core" (or town centre), and among those who attended were Le Corbusier (*q.v.*), Walter Gropius, Siegfried Giedion, J. L. Sert and Alfred Roth.

Commonwealth. *Australia.* The most notable work was in the field of small house design. Architects ranged from well-established ones such as Roy Grounds in Melbourne and Sydney Archer in Sydney, to a new group of younger architects which included John and Phyllis Murphy in Melbourne and Harry Seidler (from the United States) in Sydney. Among larger buildings worth mentioning were the Hayman Island hotel, designed by Guildford Bell and a pavilion-type hotel on a semi-tropical island in the Whitsunday passage off the north Queensland coast. Two new power stations designed for the State Electricity commission by its architect, W. E. Gower, were completed at Kiewa and Newport, Victoria.

Canada. At the end of 1950 the first awards of Massey

medals for architecture were announced. The scheme of awards was sponsored by the Massey foundation "for the benefit of the public of Canada to recognize outstanding examples of Canadian achievement in the fields of architecture and thus to give encouragement to the members of the architectural profession and to promote public interest in their work." Eight silver medals were awarded and the gold medal for the best of all the buildings entered went to the firm of John B. Parkin Associates for the Oshawa High school, Oshawa, Ontario.

Europe. *Czechoslovakia.* A new bridge was constructed across the river Vltava in Prague. Of reinforced concrete in three arches, its width was 86 ft., making it the longest bridge in Prague. It was designed by V. Hoffmann and the city architects' department and replaced an iron suspension bridge, designed by British engineers in 1868, which was in use until 1946. On Oct. 1 the death was announced in Prague of Karel Teige, one of the leaders of modern Czech architecture and art, who in 1923-24 had been a lecturer at Gropius' Weimar *Bauhaus*.

Denmark. A single-storey school with 24 classrooms for 800 children was opened in Gentofte, a suburb of Copenhagen. The architects were Hans Erling Langkilde and Martin Jensen. The buildings were grouped round a series of courtyards and had solid brick walls, concrete floors and tiled, pitched roofs of timber. Yellow bricks with thin mortar joints were used both for the exterior and for corridor walls inside. One of the first flat-blocks of its kind was completed in Gladsaxe, six miles northwest of Copenhagen. It was financed by a building society to house families where both parents worked away from home. It therefore included, in addition to the flats themselves, a common kitchen and restaurant, a nursery and a laundry. There were five storeys built to a Z-shaped plan, with a large garden on one side. Walls were of solid brick, dark red in colour, and balconies were of precast concrete, rendered white. The architects were Paul Ernst Hoff and Bennet Windinge. A college intended as a memorial to those who fell fighting the German occupation forces during World War II was completed at Fredericksberg in the western part of Copenhagen. It was planned in three wings round a green which faced onto a

The design for the new Coventry cathedral by Basil Spence, F.R.I.B.A., which was chosen in Aug. 1951 from the entries submitted by 219 architects throughout the Commonwealth.

A small country house in Australia designed by Harry Seidler.

public park. The central block was of three storeys with dining and recreation rooms on the ground floor; the flanking wings were of two storeys each. Fifty-six rooms were provided for the students. Walls were of solid brick, floors of concrete and balconies of timber. The architect was Hans Hansen.

France. In Paris a new building was erected as the headquarters of the French Master Builders' federation. It was a five-storey building consisting of continuous reinforced concrete floor slabs, supported on reinforced concrete columns and cantilevered out 10 ft. on the two long sides. The walls on these sides were of prefabricated aluminium wall panels, brought to the site ready glazed and painted, and inserted at the rate of one storey each day. The end walls were faced with Oise stone laid in courses of varying depth.

Italy. The three buildings completed during 1951 most worth recording were: the Textile exchange at Pistoia, constructed of reinforced concrete and faced with stone

(architect, Giovanni Michelucci); an orthopaedic hospital at Bari by Guiseppe Samona; and a youth hostel at Cervinia in the Val D'Aosta constructed of wood and stone (architect, Franco Albini). The architectural event of the year in Italy was the ninth *Triennale* held in Milan from June to October. Though largely an exhibition of industrial design and architectural theory, there was one particularly ingenious building, commissioned by the New York Museum of Modern Art to house the United States exhibit and designed by Belgiojoso, Peressutti and Rogers. Circular in plan with an eccentric circular garden in the centre, it was constructed of wood studs with beams spanning radially, the whole structure tied by wire stays to a suspended metal ball in the middle of the garden. In addition to the central exhibition there was also "QT8," an international experimental quarter on the outskirts of the city, started at the time of the 1947 *Triennale*, and forming part of the general plan for Milan; it included housing of many types, as well as community buildings.

Switzerland. In Zürich the Felix and Regula church by Fritz Metzger was completed. The main roof was an oval shell-concrete dome 72 ft. across at its longest span and 5 ft. 4 in. high. It was supported on sloping concentric columns and the enormous horizontal thrust was countered by a circular cable. The inauguration of the largest structure in Switzerland, the Zürich Cantonal hospital designed by a team of architects headed by Rudolf Steiger, took place in July. (I. R. M. M.)

United States. During 1951, a number of important advances were made in the design of school buildings. Examples of unusual architectural interest were the work of Lawrence B. Perkins and Philip Will, Jr., in the Chicago area; of Ernest Kump in and about San Francisco; of Henry Wright in southern California; of Walter Bogner and Carlton Richmond in Massachusetts; of Maloney and Whitney in the northwest; and of Bomberger and Reid in California. There was constant improvement in the planning of hospitals and among the important buildings of this type were: the Maimonides Health centre, San Francisco, by Eric Mendelsohn; the work of Loeb, Schlossman and Bennett in Chicago; of Magney, Tusler and Setter in Minneapolis; of James R. Edmunds, Jr., in Baltimore; and of Erhart, Eichenbaum and Rauch at Little Rock, Arkansas.

A large factory at Brynmawr, Breconshire, designed by the Architects Co-operative Partnership, which was completed in 1951.

Blocks of flats, known as *The Lawn*, which were completed in 1951 at Harlow, Essex, one of the new towns being built around London. The flats would form part of the Mark Hall North neighbourhood of Harlow.

Excellent modern houses were designed and built in 1951 in various parts of the United States; unfortunately, however, the mass of new dwellings for the low and middle-income groups showed no improvement in design except in rare instances. Although the inherent conservatism of the people might be a contributing factor in this lack of advance, there were many who held that the public had not been given the opportunity to become acquainted with a more enlightened form of dwelling-design.

Architecturally, designs for public housing did not come up to the expectations of local authorities and federal agencies. The disappointing character of most design was attributed by the architects to the restrictions of federal specifications, the high cost of construction and the discouragement of advanced architectural projects by the maze of governmental red tape. Architects fell back on established designs well within the federal specifications in order to free themselves for other work of greater architectural promise. The governmental authorities on their part expressed disappointment that unusual designs had not been forthcoming. In this field the American Institute of Architects continued to encourage the design of something better than mere stereotyped housing units.

In 1951, because of the drastic curtailment of the public buildings programme, there were few outstanding examples of governmental architecture. The general accounting office in Washington, D.C., designed by the public buildings service, was perhaps the only significant building in this category completed during the year. This building was one of the first of the so-called "block" type—a single building spanning a whole standard city block. Although still in the experimental stage, this type of building was being carefully studied as the solution to the problem of housing a great many workers in one spot without recourse to the skyscraper type of structure. (See also BUILDING AND CONSTRUCTION INDUSTRY; HISTORIC BUILDINGS; HOUSING; INTERIOR DECORATION; TOWN AND COUNTRY PLANNING.) (ED. R. P.)

* In computing the world density the area of Antarctica is omitted. † Includes Estrita as military trustee area. ‡ Areas and populations of Estonia, Latvia and Lithuania included in U.S.S.R. totals.

ARGENTINA. Second largest South American republic, occupying the southeastern portion of the continent. Area (excluding the so-called "Zona Austral" which is supposed to comprise the "Malvinas"; i.e., Falklands, and other

islands or territory in Antarctica): 1,079,965 sq.mi. Pop.: (1947 census) 16,108,573; (end-1951 est.) 17,885,000. The population is overwhelmingly European in origin (mostly Spanish and Italian, with Irish, German, Croat and Polish admixtures); in 1940 about 9% were of mixed blood, the dwindling Indian population was estimated at 262,600 and the total of foreign-born population was 2,355,900. The distribution of the population is uneven: the federal capital and the four provinces of the littoral (La Plata, Corrientes, Paraná and Sante Fé) cover only one-fifth of the total area but have two-thirds of the population; urban population is estimated at 75%. Language: Spanish. Religion: mainly Roman Catholic; Jewish 360,000. Chief towns (pop. 1947 est.): Buenos Aires (*q.v.*; capital and leading port, 3,000,371); Avellaneda, a Buenos Aires suburb (279,572); Rosario (464,688); Córdoba (351,644); La Plata (271,738); Lanús (242,760); Santa Fé (168,011); Tucumán (152,508). President of the republic, General Juan Domingo Perón (*q.v.*).

History. 1951 was an eventful year in Argentina. It began with an unofficial railway strike, which was the first indication that considerable discontent had developed within President Perón's own party. Peron announced in March that scientists working in southern Argentina had succeeded in releasing atomic energy by a new process. In April the government expropriated the most famous of Argentine independent newspapers, *La Prensa*. An Anglo-Argentine trade agreement was signed on April 23. During the winter months (May to August) there were rumours of plots to overthrow the Perón régime; bombs exploded on several of the main railway lines; and arrests were made. A serious drought affected the cattle industry and caused a reduction in the area sown for grain crops. Inflation increased, and there were widespread complaints at the rising cost of living. In August, at a large public meeting in Buenos Aires, the supreme council of the Peronista party nominated General Perón and his wife as the party's candidates for the offices of president and vice president of the republic in the forthcoming national elections; but Señora Perón's candidature met with opposition within the party and in the army, and on Sept. 1 she publicly declined to accept the vice presidential nomination. A few days later it was announced that she was gravely ill. In October an abortive revolt against the régime occurred at the military and air bases in the vicinity of the capital. The government thereupon imposed martial law and arrested many officers of the armed forces and many members of opposition political parties. The higher ranks of the army were subsequently purged of anti-Peronistas. The elections for the presidency, the vice presidency, and the federal and provincial legislatures took place democratically on Nov. 11, with women voting for the first time. The result was a decisive victory for General Perón, who thus attained the presidency of the republic for a second term of six years. At these elections the Peronista party again obtained complete control of the Senate and Chamber of Deputies.

The course of events during the year was illuminated by numerous public speeches delivered by senior members of the régime. At the time of the railway strike, the president broadcast a message in which he stated that the strike was a political attack on the government. He added:

All railwaymen will be mobilized. Those who refuse to work will go to military barracks and will be submitted to military discipline. In Argentina we have suppressed the injustices of the capitalists, but we will not permit the injustices of the workers to be enthroned.

Within three days of that speech, the strike collapsed.

In February, when bidding farewell to a mission that sailed to establish a new Argentine base in the British zone of Antarctica, Perón announced:

Step by step we will take possession of that territory. Though our rights may now be challenged, the growing power of the nation—coupled with time—will contribute to an assertion of our rights.

Commenting on the success of Argentine scientists in atomic research he remarked :

If experimental plans continue to be fulfilled as at present, the Argentine republic will possess within two years the first atomic power-houses capable of supplying the whole of the national electric power network. Only then will the world know with absolute certainty all the money and time they have wasted working for war.

At the beginning of June the president addressed a deputation of sugar workers and said :

I cast out of the country all big foreign interests. I bought everything they had, though I never paid them one centavo. That is why I have become public enemy No. 1 of the imperialist concerns—people who took millions away from us and now cannot do it; people who got our meat free and now must pay for it.

After his re-election to the presidency in November, Perón said that Argentina was progressing towards a syndicalist state.

President Juan Perón seen announcing the creation of the Grand Peronista medal for presentation on Oct. 17, 1951, to his wife (left).

Some of the year's most significant public pronouncements dealt with economic matters. Argentine pastoral and agricultural production was insufficient to provide an adequate surplus for export; the president's programme of industrialization was hampered by the difficulty of obtaining supplies of scarce raw materials and capital goods from abroad; and inflation was unchecked. These three problems were the subject of many speeches. In May and June, Perón broadcast to the farmers announcing that the official I.A.P.I. (Instituto Argentino de Promoción del Intercambio) would pay them higher prices for their crops in future, and he assured them that although the urban workers constituted the social force of the new Argentina, the agricultural workers were the fundamental economic force. On July 10 the minister of finance stated that the new Argentina did not tie herself to the principles of orthodox economics, but considered the acquisition of goods more important than the accumulation of mere monetary reserves. He said that the time had come to arrest inflation by stabilizing prices, wages and profits. But it seemed that during 1951 no adequate measures were introduced for this purpose. In October it was estimated that the cost of living had risen by about 25% during the previous six months and by about 50% since Sept. 1950.

The most important of several bi-lateral trade pacts negotiated during the year was the Anglo-Argentine agreement which was concluded in April after many weeks of haggling. This agreement provided for the shipment to Great Britain of a minimum of 230,000 tons of meat within 12 months at an average price increase of nearly one-third; a payment by the United Kingdom of £6,250,000 to Argentina in full and final settlement of meat shipped under provisional invoices in the first half of 1950; the shipment to Argentina of crude oil and fuel oil to the maximum of 4 million tons, other petroleum products to a maximum of 40,000 cu. m., 500,000

tons of coal and 27,000 tons of tin plate; the payment by Great Britain of £10,500,000 in settlement of outstanding issues arising out of the devaluation of sterling in 1949; the transfer by Argentina to Great Britain of accumulated invisible payments, and the limited conversion of certain sterling balances into other currencies. A mixed consultative committee was established to prepare a list of less essential goods to be imported by Argentina. This committee continued to study the situation during the remaining months of 1951; but Argentina, having ceased to ship meat since July 1950 because of disagreement on prices, had insufficient sterling available for the importing of British consumer goods, with the consequence that general Anglo-Argentine trade could not be resumed in normal proportions. Argentine dollar resources also diminished, mainly because of the fall in the value of wool and the cessation of wool exports to the United States. Commercial relations with Japan revived, and trade with Germany increased.

The November elections were preceded by a bill reforming the electoral law. This bill, which was passed by Congress in July, established that in future all citizens over 18 years of age must vote; that the president, vice president and senators should in future be elected by direct vote, instead of by an electoral college; that the deputies should be elected by direct vote; and that ten seats in the Chamber of Deputies should be allotted to the strongest losing party, so as to ensure the existence of a minority in the chamber. At the elections General Perón received 4,651,976 votes, his nearest rival being the Radical leader Ricardo Balbín (who had been in and out of prison on charges of disrespect of the president) with 2,358,860 votes.

The best-selling Argentine book of the year was Señora Perón's autobiographical work *La Razón de mi Vida* ("My Life's Meaning"). (G. P.)

Education. (1945): primary 14,294, pupils 2,064,464, teachers 79,741; secondary (1946) 1,145, pupils 221,409, teachers 28,360; universities (1943) 8, students 62,870.

Agriculture. Main crops ('000 metric tons, 1949-50; 1950-51 in brackets): wheat 5,144 (5,500); barley 395 (708); oats 540 (692); maize 836 (3,500); rye 277 (413); potatoes 1,167 (1,500); rice, paddy 130 (140); cotton, ginned 142 (110); sugar, raw value 549 (613); tobacco 25 (33); groundnuts 49; cottonseed 284 (217); linseed 676 (532); rapeseed 15; sunflower seed 712 (1,000). Livestock ('000 head): horses (1949) 7,238; asses and mules (1949) 501; cattle (1951) 43,000; sheep (1951) 50,000; pigs (1951) 2,800.

Industry. Industrial establishments (1947) 101,884; persons employed in manufacturing industries (1949) 1,169,000. Fuel and power: coal ('000 metric tons, 1950) 25; electricity consumption (million kwh., 1949; 1950 in brackets) 4,116 (4,428); crude oil ('000 metric tons, 1950; 1951, six months, in brackets) 3,396 (1,830). Raw materials ('000 metric tons, 1949; 1950 in brackets): lead, smelter basis, 18 (23); zinc ore, metal content, 11 (12); sulphur 9. Manufactured goods ('000 metric tons, 1950; 1951, six months, in brackets): cement 1,572 (763); cotton yarn 75.6; rayon yarn 6.92.

Foreign Trade. (Million pesos, 1949; 1950 in brackets): imports 4,642 (4,829); exports 3,719 (5,421). Main sources of imports (1950): U.S. 16.2%; France 14.5%; U.K. 11.8%; Brazil 7.8%. Main destinations of exports: U.S. 20.4%; U.K. 17.9%; Brazil 8.6%; Italy 6.4%. Main imports (1950): machinery and vehicles 20%; iron and steel products 15%; fuel and lubricants 12%; textiles 12%. Main exports: cereals and linseed 21%; wool 16%; hides 13%; meat 11%.

Transport and Communications. Roads (1950): 37,000 mi. Motor vehicles licensed (Dec. 1950): cars 250,000, commercial 160,000. Railways (1949-50): 26,568 mi.; passenger-mi. 8,260 million; freight net ton-mi. 10,580 million. Shipping (merchant vessels of 100 gross tons and over, July 1950): 405; total tonnage 928,106. Air transport (1949): mi. flown 8 million. Telephone subscribers (1949): 679,335. Wireless licences (1949): 1,704,893.

Finance and Banking. (Million pesos) Budget: (1950 est.) ordinary revenue 5,202, ordinary expenditure 5,102; expenses met by the issue of bonds 2,740. National debt (June 1949; Dec. 1950 in brackets): 13,992 (16,000). Currency circulation (July 1950; July 1951 in brackets): 9,174 (12,655). Gold reserves (million U.S. dollars, July 1950; July 1951 in brackets): 216 (288). Savings and bank deposits (Jan. 1950; Jan. 1951 in brackets): 10,359 (12,220). Monetary unit: *peso*, with a basic export rate (Oct. 1951) of 14.0 pesos to the pound and 5.0 pesos to the U.S. dollar, and a free market rate (Oct. 1951) of 39.9 pesos to the pound and 13.7 pesos to the U.S. dollar.

ARMIES OF THE WORLD. During 1951 fighting continued in Korea, the threat of a Chinese intervention in Indochina did not materialize and in Europe the North Atlantic Treaty organization (N.A.T.O.) made slow progress. Rearmament in the United States reached the point where \$2,000 million in military items were being delivered each month.

United States. Army strength increased during 1951 from 1,100,000 and the equivalent in organized combat units of 18 divisions, to 1,600,000 and the equivalent of 24 divisions, composed of 18 divisions and 18 regiments. The budget for the army, which was \$4,000 million in 1950 and \$19,500 million in 1951, increased only slightly to \$20,700 million in 1952 (all fiscal years). Although there were serious deficiencies in equipment, particularly new medium and heavy tanks, specialized vehicles, rockets, guided missiles and radar, arms were flowing from the factories. Deliveries of equipment to N.A.T.O. powers were gradually building up, and 2,148 light and medium tanks had been delivered to France at the end of 1951. Over-all deliveries to all powers included 1,185 aircraft, 219 naval vessels, 6,907 tanks and combat vessels, 10,679 artillery pieces and 643,369 small arms and machine guns. (See also MUNITIONS OF WAR.)

Organization. Although the role of tactical aircraft and control of ground support missions continued to be a hotly debated subject between the army and the air force, no changes were made in controls. The air force announced the establishment of a pilotless bomber squadron to launch guided missiles in the direct support of ground troops. Ranger units were reduced in size and were to be assigned at the rate of one company to a division.

Disposition. By the end of 1951 the seven U.S. divisions in Korea were all up to strength and there were two divisions in reserve in Japan. The arrival of the 28th and 43rd infantry

divisions in Germany completed the organization of the 7th army which consisted of these units plus the 1st and 4th infantry divisions, the 2nd armoured division and the constabulary which was the equivalent of another armoured division. In the United States the 37th (Ohio national guard) and 44th (Illinois national guard) divisions were alerted for federal service early in 1952.

Training. An air-ground support centre was established at Fort Bragg, North Carolina, to strengthen the field forces for combined exercises. A new training programme was developed for national guard units. Several major training exercises were held, both in the United States and in Germany.

Exercise Southern Pine held during September was a controlled operation using the "aggressor force" as a training aid and stressing large-scale offensive and defensive night operations. Airborne troops and tactical aviation played important roles as about 103,000 troops were used, including the 7th corps, 28th and 43rd infantry divisions, 82nd airborne division, 511th regimental combat team of the 11th airborne division, 2nd armoured cavalry regiment, 301st logistical command and elements of the 9th air force. While the exercise showed that the drop technique for heavy equipment was well advanced, it proved the value of the C-122 assault transport for landing troops behind enemy lines.

Exercise Combine was the largest training operation yet held by U.S. troops in Germany. Using the characteristic attack from the east, the exercise indicated poor camouflage discipline, inadequate dispersal of troops and no security measures in rear area, but showed good speed in counter-attacking and air-ground liaison.

Equipment. The 57-, 75-, and 105-mm. recoilless rifles proved themselves in battle and contributed to the doubling of the fire power of infantry divisions. New atomic weapons for tactical use in the field were tested. Canada, Great Britain

A pontoon bridge which was built in four hours across the River Main near Hanau, Germany, by troops of the U.S. 4th Division. The division arrived in Europe in 1951 to serve under General Dwight D. Eisenhower.

Troops of the Swiss army taking part in a ski-run endurance test during mountain exercises held for reservists in Feb. 1951.

and the United States agreed to standardize the use of 400 items, including the T-41 U.S. light tank and 8-in., 75-mm. and 240-mm. howitzers. But controversy continued over the adoption of a standard rifle, with the British .280, the U.S. .30 and the Belgian 7-mm. as the outstanding contenders. A new armoured personnel carrier was developed as well as an amphibious vehicle with great mobility over sand and tundra.

Development of tanks still lagged. The T-41 light tank was acknowledged one of the best in the world, with a 76-mm. gun, speed of 25 m.p.h. and weight of 25 tons, although it was too heavy for airborne operations. Unreliable turret control hampered development of the T-47, which mounted a high-velocity 90-mm. gun and weighed 47-48 tons. No heavy tanks with 120-mm. guns were yet in operation.

Great Britain. Defence expenditure increased to 24% of the budget and 8% to 10% of the national income. Tank production was doubled, including production of the 50-ton Centurion, which was supplied to the armoured divisions in Germany. The arrival of the 6th armoured division in Germany completed the Army of the Rhine, which included, in addition, the 2nd infantry and the 7th and 11th armoured divisions. British troops participated with Norwegian, Dutch, Danish and Belgian brigades in joint manoeuvres. Egyptian attempts to eject British forces from the Suez canal area resulted in the reinforcement of that region at the end of the year with the 1st division from Libya and the 16th parachute brigade from Cyprus. (See also BRITISH ARMY.)

Other N.A.T.O. Powers. *France.* The continued fighting in Indochina was the chief factor affecting the French army. Although France under General Jean de Lattre de Tassigny had made some progress in containing the Vietminh forces, the attrition was considerable, with a total of 28,000 men and 1,014 officers listed as killed or missing. At the end of the year, there was apprehension of a major Vietminh assault, perhaps

with open intervention on the part of Communist Chinese. During the year the Vietminh progressed from guerrilla bands into well-equipped infantry organized into regimental combat teams and using such modern weapons as the 75-mm. recoilless rifle.

In metropolitan France conscription was lengthened from a year to 18 months, but the principal problem was equipment. Of the ten French divisions, two infantry and one armoured division in Germany were at combat strength, another armoured division was at 70% of strength and five infantry divisions and one armoured division in France were at from 20% to 70% of strength. The manpower, in trained reserves, awaited only the equipment to fill out the divisional strengths.

The French army revised the officer training system, abandoning the use of Coëtquidan (which replaced war-damaged Saint-Cyr after World War II) as a single school for the training of officers in all branches. The modification adopted represented a change toward the pre-World War II system. One academy at Coëtquidan would provide two years of training for the *élite* of the officer corps capable of advancing to higher ranks and also would train in a one-year course non-commissioned officers and officer candidates from the ranks. Graduates would be sent to Saumur for motorized and cavalry training, Châlons for artillery, Angers for engineering and Fontainebleau for quartermaster specialization.

In addition to manoeuvres conducted in Germany with other N.A.T.O. powers, France held special Alpine operations in August using the 27th Alpine infantry division. Experiments in these exercises included the use for the first time of mountain paratroopers in the "capture" of the mountain fortress of Briançon on the French-Italian frontier.

Belgium. The armament industry was developed as a major contributor to N.A.T.O. equipment. Among the

important items being produced were five-inch rockets, anti-tank grenades, non-detectable land mines, motor transport, Bofors anti-aircraft guns and radar equipment. In Korea the Belgian battalion changed its equipment from British to U.S., and adopted the U.S. 75-mm. recoilless rifle and U.S. company strength of 160 compared with the previous 120 to 130. Belgium extended the period of compulsory military service to 24 months.

Canada. Canada announced a three-year defence plan that would cost a total of C\$ 5,000 million and indicated that it planned to form another division towards an ultimate goal of 115,000 full-time personnel in its armed services. In addition to the brigade in Korea, the 27th brigade was sent to Germany, as part of the 12,000 troops destined for Europe. Arms were supplied to one Dutch, one Belgian and one Italian division, and artillery to a Luxembourg artillery regiment.

Denmark. The term of compulsory service was increased from 12 to 18 months to add 7,500 to 16,000 to the numbers called to active duty each year. One brigade continued to serve with the N.A.T.O. forces as plans were made to form one complete division. Defence expenditure increased by 40%.

Italy. The most important development affecting the Italian army in 1951 was the lifting of the peace treaty limitations on the strength of the army as a result of notes from the major treaty signers. The biggest drawback to increasing the strength of the army beyond the previous 250,000 limit was the lack of equipment. The Italian units that appeared to be in greatest combat readiness were the Alpine brigades. Conscription was increased from 12 to 15 months.

Italian soldiers being taught how to use a U.S.-made bazooka at an infantry training school near Rome. Much of the equipment of the Italian army was supplied by the United States.

Netherlands. The conscription period was increased from 12 to 16 months.

Norway. Conscripts were retained for additional defence courses, and reserve personnel were recalled. A budget of \$350 million for special defence measures up to the end of 1954 was passed.

Portugal. A United States military mission was assigned to assist the development of the 30,000-man army, which was both under-trained and under-equipped. The ultimate goal was eight to ten divisions.

Western Germany. No rearmament was accomplished in 1951, as debate continued on the structure of the European army. Plans called for the organization of an army modelled on U.S. lines. Men from 18 to 21 would be conscripted toward the development of an army composed of 12 divisional slices of 30,000 men each, with the U.S. or Great

Britain supplying the heavy artillery and tanks. Another obstacle to the development of the army was German reluctance to bear the cost of its organization while paying the occupation costs of the U.S., British and French armies amounting to \$1,400 million a year. The probable composition of the German army would be 3 armoured divisions with about 300 tanks each, 6 motorized divisions with 70 tanks each and 3 infantry divisions. (See also NORTH ATLANTIC TREATY ORGANIZATION.)

European "Neutrals". **Spain.** The outstanding development of 1951 affecting Spain was preliminary discussion with the United States on the use of bases in exchange for assistance. The U.S. was expected to be granted facilities at Cádiz, Cartagena, Ferrol, Santa Cruz, Barcelona, Madrid and Seville. U.S. inspection of the Spanish army revealed about 250,000 men in the army formed into about 22 weak divisions, although the largest manoeuvres that could be held were in less than regimental strength. Small arms were plentiful, but all other equipment was an assortment left from the Spanish Civil War and was a combination of German, Italian, French and Russian. However, a good potential was revealed with wartime mobilization of 2 million and a natural ability for guerrilla warfare. Immediate steps were planned to train Spanish officers and non-commissioned officers in the United States, to increase the number of officers by increasing the programme at universities, to provide artillery, radar and anti-tank weapons and to make essential economic improvements such as those in highways, railways and ports.

Sweden. The commander in chief of the armed forces asked for a change in the draft law to permit 70,000 men to be called up for a refresher course of six months.

Switzerland. Steps were taken to increase the armoured force by 550 medium tanks. The annual budget of \$115 million for the army was to be augmented by \$250 million for extra equipment during the period 1951-55.

Yugoslavia. Military aid began to arrive from the United States, and the U.S. chief of staff inspected the army. A U.S. military mission arrived to assist in training in the use of the equipment.

U.S.S.R. There was no indication of any change of Soviet strength during the year. The army strength continued at about 2.5 million men organized into 175 divisions, of which about 65 were armoured or motorized. There were definite indications that Soviet equipment was improving in quality, and tank strength was estimated at 30,000. About one million men were being drafted each year for a three-year period of military training, and trained manpower was estimated at 12 million to 13 million.

Six Soviet occupation armies—the 1st, 2nd, 3rd, 4th and 7th guards armies, and the 3rd shock army—were in Germany, all up to strength. Under the command of General Vasily I. Chuykov, manoeuvres in 1951 tended to concentrate more on defence than previously. The last conscripts with battle experience, the class of 1927, returned to the U.S.S.R.

There were no indications of any important changes in Soviet dispositions in Europe. There were reports of increased Soviet forces in the far east.

Soviet European Satellites. **Czechoslovakia.** The reconstructed armaments industry played an increasingly important role in the Soviet programme with arms being sent to China. The army reached a strength of ten divisions including four motorized and one armoured corps of three brigades, with an over-all strength of around 150,000 men.

Eastern Germany. The people's "police" Bereitschaften were reorganized into 23 formations, each intended to be a 2,000-man cadre for a Soviet-type infantry division of 11,000 men. It was reported that the top command was now under the Russians, and 150 senior officers were trained in the U.S.S.R. In addition, 5,000 officer candidates were trained

in a nine-month course, with one in every seven specially trained as a political commissar.

Hungary. Reports varied on the actual strength of the Hungarian army. There was little question that the sovietization of this force reached a new high level in 1951, perhaps including the insertion of Hungarian regiments into Soviet divisions and the elimination of purely Hungarian higher headquarters. Satellite manoeuvres were reported near Szolnok in September, including Soviet, Rumanian, Bulgarian and Czechoslovak troops as well as Hungarian.

Rumania. Compulsory military service for all specialized branches of the army was extended from two to three years. (See also POLAND.)

China. Communist. Full mobilization continued in an effort to develop an army of 2.5 million. Five new military training schools were organized including artillery, tank and anti-aircraft artillery. The Chinese Communist forces identified in Korea included large elements of the 4th army group, including the 12th, 13th, 14th, 15th, 16th, 17th, 21st, 51st, 53rd, 55th, 56th and 57th armies. Chinese Communist armies generally consisted of three divisions, each of 6,000 to 8,000 men. (See also KOREAN WAR.)

Nationalist. The U.S. military advisory group advocated a shake-up of the army concentrated on Formosa, and a reduction of its size to take advantage of the available equipment. Of the 550,000 men, only about 300,000 were rated of good quality.

Middle East. Arab Countries. Little increase in strength was shown during the year; a total combined strength was two divisions. Jordan's Arab legion, with the equivalent of an understrength division, and the Egyptian army with one organized division, were the strongest forces. In addition, Egypt had a regiment of tanks composed of 16 British Centurions and a few U.S. Shermans.

Israel. The defence budget was more than tripled, and favourable reaction was indicated to the plan for a middle east command with a possible wartime contribution of 200,000 men.

Japan. With the signing of a peace treaty, plans were made for the formation of an army. The natural cadre for this body was the Japanese national police reserve, composed of 75,000 men organized into two corps of two divisions each and armed with small arms, machine guns and mortars. Initial plans called for the doubling of this force.

Philippines. The strength of the army was increased by 10 battalion-size combat teams, bringing numbers up to 24 battalions of 1,000 men each in addition to the constabulary of 7,500. Considerable progress was made toward cutting down the strength of the Hukbalahaps, whose armed strength was around 5,900. (L. B. K.)

ART EXHIBITIONS. The outstanding exhibition of 1951 was undoubtedly that of Caravaggio and his followers at Milan. This exhibition, of which the prime mover was Professor Roberto Longhi, responded to the revived interest in and enthusiasm for Caravaggio which had been growing in recent years and, in turn, gave them fresh impetus. It displayed the greater part of the master's known output, calling attention in particular to those noble last works which for centuries had been virtually incarcerated in the impenetrable gloom of Sicilian churches. And, what was no less necessary, it set Caravaggio in his historical perspective by including a few examples of those Cremonese mannerist pictures in which his style is latent and numerous works by his immediate followers in Italy and elsewhere and by those who absorbed his overwhelming influence at further remove.

The exhibition at Venice of the two Tiepolos, Giovanni Battista and Giovanni Domenico, was a little disappointing

owing to the fact that the Giardini, where it was held, proved unsuitable for the display of these supremely sumptuous and decorative artists. Although the bulk of Giovanni Battista's altar-pieces and a rich variety of his sketches were brought together, his great wall-decorations could not, of course, be transported from the palaces around Venice and elsewhere for which they were conceived.

A Burgundian exhibition, first assembled at Dijon and later shown in Amsterdam and Brussels, included notable works by Jan van Eyck and Rogier van der Weyden, while the Museum of Arras staged an exhibition of mediaeval art in Artois. An interesting exhibition displaying the connections between Flemish and Italian art in the 15th, 16th and 17th centuries was shown at Bruges, Venice and Rome. Unfortunately, the 16th and 17th centuries were not adequately represented. An extensive exhibition of 17th-century Dutch landscapes was held in Paris at the Orangerie. An exhibition of "Costume in Five Centuries of Painting," held at the Palazzo Madama, Turin, included works by Parmigiano, Lucas Cranach the elder, Rubens, Renoir and many others.

There were a number of interesting 19th-century exhibitions. That of Goya at Bordeaux suffered from its lack of works from the Prado, Madrid; later, however, it was moved to the Prado itself. A remarkable collection of French Impressionist pictures from German collections was shown at the Orangerie in Paris, as was the comprehensive exhibition of Toulouse-Lautrec, which included a number of important loans from the United States. The rise of interest in the origins of expressionism produced important exhibitions of Edvard Munch, shown in a number of capitals, and of James Ensor, at Antwerp.

An extremely well-arranged and documented exhibition of the group of Dutch architects and abstract artists known as *de Stijl* was held at the Stedelijk museum, Amsterdam. Three outstanding shows of modern sculpture took place in Paris: a retrospective of Pablo Picasso's work in sculpture at the Maison de la Pensée Française; a retrospective of Henri Laurens at the Musée d'Art Moderne; and the long-awaited exhibition of new works by Alberto Giacometti.

In Great Britain, 1951 being Festival year, English art tended to monopolize the countless loan exhibitions arranged by official bodies, national and regional. With dealers' shows to fill in some of the gaps, almost every aspect and period of English art was thus represented, more or less comprehensively, at one time and place or another. The main section of the Royal Academy's 1950-51 winter exhibition at Burlington house, London, entitled "Works by Holbein and other Masters of the 16th and 17th Centuries," was devoted to Tudor portraits. All but a handful of the paintings and drawings by Hans Holbein the younger himself belonged to his English periods; these were supplemented by an extensive selection of pictures by Holbein's followers in England, notably Hans Eworth. (The remainder of this exhibition is referred to below.) Stuart art was represented by the examples of the Mortlake period which dominated an important exhibition of English tapestries held in Birmingham, and by the first exhibition of William Dobson, painter to Charles I's court at Oxford, which was shown initially at Worcester and then transferred to the Tate gallery, London. It was very desirable that the father of English painting, William Hogarth, should be properly represented during the Festival year. But, unfortunately, owing to the inevitable exclusion of the important series of narrative pictures and to the inclusion of certain irrelevant works, the exhibition devoted to him at the Tate did not show him to be the great master he undoubtedly was. The golden age of English portraiture was represented by Gainsborough at Bath, by Reynolds at Plymouth, by John Opie at Truro, by Lawrence in Bristol, Brighton and London

"Girls on the Bridge," by Edvard Munch, shown in 1951 at the Tate Gallery, London.

This formidable panorama of English art was completed by three exhibitions of wider scope. The Arts Council's "Three Centuries of British Watercolours and Drawings" was an avowedly personal anthology compiled by Brinsley Ford. "Ten Decades: a Review of British Taste, 1851-1951," organized by the Institute of Contemporary Arts, was perhaps the most adventurous exhibition of the year. Each decade was represented by a selection of British works of the period which had appealed to some section or other of the public: thus the parallel traditions of serious, fashionable and popular art were displayed together. Certainly this was the most instructive and the most entertaining exhibition of English art held in Great Britain in 1951. The most distinguished artistically was that which brought the year to a splendid conclusion: the Royal Academy's "First 100 Years of the Royal Academy, 1769-1868," in which all the leading English artists within the period were represented, with the exception of Romney, Rossetti and Whistler.

Although there was little room for large-scale shows of continental art, a

(at Agnew's), and at the Tate by a selection of Eton Leaving-
portraits, which, however, apart from the Romneys were of little artistic, though of considerable historical, interest. The re-opening of the Walker Art gallery, Liverpool, was marked by a comprehensive exhibition of the work of George Stubbs. The tempera paintings of William Blake—most of them recently restored—were brought together in London at the Arts Council's gallery. A large exhibition of John Martin at the Laing Art gallery, Newcastle, included five newly discovered oil paintings. The Whitechapel Art gallery resuscitated William Frith. And in Hampstead there was shown a well-chosen selection of "Constable and his Contemporaries."

The Festival of Britain coincided, by a happy chance, with the centenary of the death of Turner, often acknowledged to be his country's greatest artist. Disappointment was widespread, therefore, that no comprehensive Turner exhibition was arranged. Some compensation was provided by the showing, for the first time in London, of the 18 Turners from Petworth house, Sussex, which were on view at the Tate (some of them side by side with related works from the gallery's own collection), by a remarkable selection of drawings and water-colours by the artist and his contemporaries at the British Museum (where emphasis was laid on Turner's most summary and daring later works) and by a loan exhibition of water-colours at Agnew's (which consisted chiefly of more "finished" works).

Of the moderns, W. R. Sickert was seen to advantage in London at Roland, Browse and Delbanco's and at the South library, Islington, while at Southampton he figured in an important exhibition of the Camden Town group. Memorial exhibitions to Edward Wadsworth, Randolph Schwabe and A. S. Hartrick were held in London. There was a large-scale retrospective show of Henry Moore at the Tate, and a smaller one of Graham Sutherland at the Institute of Contemporary Arts. A general survey of English painting of the last 25 years, in the form of two rather haphazardly chosen anthologies, was presented by the Arts Council in London and various provincial centres.

number of modern foreign artists were given one-man exhibitions in London, most of them for the first time. The Tate showed the memorial exhibition of Munch which had been touring Europe; the Institute of Contemporary Arts, to celebrate Pablo Picasso's 70th birthday, arranged a retrospective exhibition of his drawings composed for the most part of works from the artist's own collection. Dealers' galleries staged shows of Othon Friesz, Louis Marcoussis, Salvador Dali, Bernard Buffet, and the sculptors Charles Malfray, Henri Laurens, Alexander Calder, Marino Marini and Fritz Wotruba. Selections of pictures by Toulouse-Lautrec, Renoir and the Fauves were shown, as also the complete set of Degas' bronzes. The Burrell collection of French paintings of the 19th century was exhibited in London. The second International Exhibition of Sculpture at Battersea park, London, was held. But the most ambitious exhibition of modern art, the Royal Academy's show of the Paris school, was a great disappointment, thanks to ill-considered selection and deplorable hanging.

The "Other Masters" section of the Academy's winter exhibition of 1950-51 was an uneven and arbitrary agglomeration of 16th and 17th century works, mainly Italian. Nevertheless, it included a number of extremely interesting items: the great Glasgow "Christ and the Adulteress" and important paintings by Titian, van Dyck, Caravaggio, Bernardo Strozzi and Massimo Stanzione, sculptures by Bernini and Giovanni Bologna, numerous drawings by Guercino, Bernini, Giovanni Castiglione and the Carracci, the great Leonardo da Vinci cartoon from the Diploma gallery and groups of superlative Raphael and Michelangelo drawings from Windsor castle.

The Whitechapel Art gallery presented a charming exhibition of 18th-century Venetian art. The National gallery put on show a number of paintings from the Liechtenstein collection, including first-rate examples of Rubens, Franz Hals and Orazio Gentileschi. Rubens' magnificent paintings for the ceiling of the banqueting hall, Whitehall, having lately been restored, were shown at Kensington palace, where they could

be closely examined, before their return to the upper regions of the banqueting hall. Outside London, mixed exhibitions of old masters were presented at Newcastle, York and Perth, the mediaeval art from the Burrell collection was shown in Glasgow, and the National Gallery of Scotland assembled a number of Spanish paintings which included unfamiliar masterpieces by El Greco, Velasquez and Goya.

Finally, three important exhibitions of non-European art were held in London during the year: the Rothenstein collection of Indian paintings at the Victoria and Albert museum, Tang art at the British museum, and, at the Imperial institute, "Traditional Art from the Colonies," including some newly excavated terracottas from Nigeria. (A. D. B. S.)

United States. A revival of interest in German Expressionism came about with the large showing of paintings by Lovis Corinth (1858-1925) at the Boston Institute of Contemporary Art. This museum also organized an interesting exhibition of the work of the 82-year-old Irish painter, Jack B. Yeats, brother of the poet, William Butler Yeats.

With 100 works from 85 artists, New York's Museum of Modern Art showed "Abstract Painting and Sculpture in America," covering the period from 1913 when the famous Armory show gave the U.S. its first view of advanced art trends from abroad. The Cleveland Museum of Art and the Museum of Modern Art combined in a full-length retrospective exhibition of paintings and some sculpture by the Italian-born Amedeo Modigliani (1884-1920).

Yale university's Gallery of Fine Arts and the Baltimore Museum of Art joined forces to do "Pictures for a Picture" of Gertrude Stein as a collector and as a writer on art and artists. This stimulating exhibition was largely drawn from Yale's rich collection of Stein manuscripts and from the noted Cone collection recently left to the Baltimore museum. Added to this was Pablo Picasso's famous portrait of Gertrude Stein lent by the Metropolitan Museum of Art, New York.

A comprehensive memorial exhibition of paintings by C. S. Price was arranged by the Portland (Oregon) Museum of Art. Price, born in Iowa in 1874, was a cowboy in Wyoming and ultimately became a painter. Largely self-taught, he was a semi-abstract, visionary painter who evolved his advanced viewpoint from inner compulsions rather than from contact with other artists.

The art of the northwest coast Indian was featured at the Brooklyn museum where house posts, totem poles and many other wooden objects and weavings showed the highly developed culture of the tribes inhabiting the narrow 1,000-mi. coast area stretching from the Columbia river to Alaska. A similar exhibition was a summer event at the Colorado Springs Fine Arts centre where the noted designer Herbert Bayer did a special installation.

The Carnegie institute in Pittsburgh showed eight centuries of French painting, 1100-1900, with 172 paintings, illuminations and drawings. First-rate material was borrowed from collections all over the country, the climax being Jean-Baptiste Chardin's "Saying Grace," lent by the Louvre in Paris.

The Art Institute of Chicago featured an "all-invited" exhibition in its 60th annual of painting and sculpture. The \$2,000 Logan prize went to William de Kooning for "Excavation," the \$1,000 Logan prize to Theodore J. Roszak for "Sea Quarry" (later purchased for the Norton gallery at West Palm Beach, Florida), and the \$1,000 Walter Campana Purchase prize was awarded to Herbert Katzman for "Views of Prague."

One of the outstanding events of the season was the large retrospective exhibition, at the Museum of Modern Art, of the work of Henri Matisse. The finest of his works were borrowed from the French government and from museums and private collections in the U.S., liberally supplemented by loans from abroad including many items from the artist himself. The exhibition was scheduled in 1952 for Cleveland,

Chicago and San Francisco. (See also ART SALES; ARTS COUNCIL OF GREAT BRITAIN; DRAWING AND ENGRAVING; MUSEUMS; PAINTING; SCULPTURE.) (F. A. Sw.)

ARTHRITIS: see RHEUMATIC DISEASES.

ART SALES. During 1951 economic conditions helped to maintain the brisk flow of art sales and to support a continued high level of prices. In Great Britain the event of the year was the sale of the works of art collected over many years by Walter Hutchinson (d. 1950). He had intended to develop a "National Gallery of British Sports and Pastimes" around this collection, but his death had intervened and the directors of Hutchinson and Company, the publishers, arranged for its disposal at Christie's, London. The sale opened with the disposal of John Constable's "Stratford Mill" for £44,100, bidding having opened at £10,500. The National Gallery of Canada bid strongly, but the eventual purchaser was Major R. N. Macdonald-Buchanan, who also bought the famous "Gimcrack standing near the Rubbing House at Newmarket," by George Stubbs, for £12,600. The Constable had appreciated by over £1,000, the Stubbs by more than £8,000. Both prices were records for the works of the two artists, as was the £4,830 paid by the Duke of Rutland for Ben Marshall's "Sam Chifney on the Duke of Rutland's Sorcery, winner of the Oaks, 1811." Two other works by Marshall had also increased greatly in value, and it was obvious that there was still a considerable demand for the pictures of the more important sporting painters. Altogether there were a dozen Stubbs paintings for sale, and they fetched a total of over £20,000. The two paintings by George Morland, "Children Birdnesting" and "Juvenile Navigators" which Hutchinson had bought for £10,200, brought in £10,930, and a painting by Thomas Gainsborough of partridge-shooting doubled its 1946 price. Seventeen paintings by the past president of the Royal Academy, Sir Alfred Munnings, were sold for £9,901, and a painting by James Tissot of Henley regatta brought in £945.

Another record was broken at Christie's in June when a magnificent copy of J. J. Audubon's "Birds of America" was sold for £7,000. Another high price paid at the same sale was the £147 given for a pencil drawing by Augustus John. The Earl of Lanesborough sold at Christie's in the same month a collection of paintings for a total of £18,598; of these the most outstanding was a panel by Peter Paul Rubens of the death of a stag. Thomas Lawrence, whose genius was commemorated during the course of the year by two important exhibitions, one at Agnew's, London, the other at Brighton, commanded very respectable prices; his "Portrait of Miss Bloxam" brought in £1,102 in July. Constable's works were now so much sought after that even his slightest manifestations commanded high prices: nearly £9,000 was paid in January for a collection of 46 of his small sketches. On the other hand, this "name-hunger" often resulted in quite remarkable works being disposed of very cheaply: a Vincenzo Foppa was sold for £950, and a very fine small Gabriel Metsu for £520.

Several Harewood house paintings of rather smaller interest were sold during the year. The increasing value of even an attributed painting was shown by this sale: an arched panel attributed to Botticelli brought in five times the price for which it had been sold in 1935.

In the summer Sotheby's, London, sold a number of important Dutch paintings including a Pieter de Hoogh, bought by a New York firm for £1,700, a Jacob van Ruisdael of a fish market, which sold for £1,700, and a flower piece by Nicolaas van Verendael (Flemish school, 1640-91) for £620.

The popularity of paintings and other works of art with an American connection was marked. For instance, a half-length

portrait of George Washington was sold in October for £997 10s. The paintings which had belonged to Lord Lothian, former British ambassador in Washington, contained no Americana, the most important work among them being by Jean-Honoré Fragonard. One of the most interesting price-reversals of the year concerned a painting by Melchior d'Hondecoeter (Dutch school, 1636-95) which in 1894 had cost £1,575 but in Oct. 1951 brought in only £399. In Christie's last sale of the year, on Dec. 21, 1,700 guineas was paid for a W. Van de Velde seascape, "The Evening Gun"; a Raeburn portrait "Colonel Thomas Balfour, of Elwick" (ex collection D. Balfour) and another Marshall also changed hands.

Sir Philip Hendy, the director of the National Gallery, London, complained at some length in *Britain Today* about the drain of works of art away from Great Britain but in *The Economist* Denys Sutton, a well-known art critic, put forward, very persuasively, the opposite view that in the free export and import of works of art a kind of rough justice was eventually established. In this connection it is worth noting that one of the more interesting features of art sales during the previous few years had been a tendency for Italian works of art to find their way back to their own country after a century or so of exile.

Christie's received a permit to rebuild their premises in King street, St. James's, London, which had been destroyed in an air raid in 1941.

In Paris the Hôtel Drouot celebrated its centenary with a year of prodigious activity in which probably the most important sale was that of the Schloss collection of old masters. There was a general increase of from 25% to 50% on the previous season's prices for works by contemporary masters. Paul Cézanne's paintings were fetching upwards of Fr. 2.5 million, those of Henri Matisse about Fr. 1 million.

Porcelain was as popular as ever; at Sotheby's in June a pair of Chelsea figures of partridges, which in 1949 had been sold for a little over £500, more than doubled in value. An unrecorded Chelsea white owl sold at Sotheby's on July 20 for £3,400, and in October £1,050 was paid for a rabbit soup tureen of the same origin. French furniture continued to fetch high prices and the collection of A. E. H. Digby realized £14,742 on June 22. Old English furniture was also popular; a pair of Sheraton rosewood commodes brought in £1,155 and a mahogany writing desk by William Kent was sold for £483.

A sale of literary and associative interest rather than artistic importance, but conveniently dealt with here, took place at Sotheby's on Dec. 17. A battered copper loop-type hunting horn, once used by John Peel, was bought by W. N. Johns-Powell of Cardiff for £600, after an opening bid of £100. (See also ART EXHIBITIONS.) (B. DR.)

ARTS COUNCIL OF GREAT BRITAIN.

In 1951, in addition to its normal work, the Arts Council was responsible for ensuring that the arts were appropriately represented in the programme of the Festival of Britain (*q.v.*). This entailed a nation-wide operation, consisting of a London season of the arts, arts festivals at 22 specially chosen centres in Great Britain and festival activities in many other places.

The London season took place in May and June, when a formidable concentration of concerts, plays and exhibitions was staged in the metropolis. With the help of the leading musical organizations, the Arts Council arranged nearly 300 concerts in London concert halls and churches. Special opera and ballet seasons were held at the Royal Opera house, Covent Garden, and at Sadler's Wells theatre. The annual opera festival at Glyndebourne, Sussex, took place and the English Opera group appeared at the Lyric theatre, Hammer-smith. Many theatre managements, including the Old Vic,

put on festival productions, Shakespeare and Shaw being particularly well represented. Eleven exhibitions of painting and sculpture were arranged by the council specially for the London season.

The 22 arts festivals throughout the country with which the council was associated ranged from a long-established festival such as the Three Choirs (Worcester) to an entirely new festival at York, and from the large-scale international festival at Edinburgh to the small intimate one at Aldeburgh, Suffolk. Each was successful in developing or consolidating its own individual type of programme and presenting the arts in a unique and attractive setting; there were excellent attendances everywhere.

The Arts Council took the opportunity afforded by the Festival of Britain of placing various commissions. Operas and ballets were commissioned for the leading companies. There were competitive schemes for operas and for poetry in English, Scots, Gaelic and Welsh, the English prize-winning poems subsequently being published (see below). Twelve sculpture commissions were placed, of which several were shown at the South Bank exhibition, and 60 painters were invited to paint large canvases. These were exhibited, and the council purchased eight of them. A number of composers accepted invitations to write new works, all of which were performed during the festival. (E. W. WTE.)

See Arts Council of Great Britain, *Sixth Annual Report, 1950-51* (London, 1951); *Poems 1951*, the prize-winning poems in English at the Arts Council Festival of Britain poetry competition (Penguin Books, London, 1951).

ARUBA: see NETHERLANDS OVERSEAS TERRITORIES.

ASCENSION ISLAND: see SAINT HELENA.

ASSASSINATIONS. Assassinations during 1951 included the following:

Jan. 4. Penang, Malaya. Cheoh Hai-leng, correspondent of the Chinese Central News agency and manager of an advertising bureau, was shot dead in his office by an unknown assassin, who escaped.

Jan. 12. Saigon, southern Vietnam, Indochina. Henri de la Chevrotière, editor of the newspaper *Union Française*, was killed by grenades thrown by two terrorists.

March 2. Nablus district, Jordan. Khaled Hussein, district organizer for the United Nations relief works agency, was shot by unknown gunmen while travelling in his car.

March 7. Tehran, Persia. General Ali Razmara, the Persian prime minister, was killed outside the Maschede Soltaneh mosque by four shots fired by Abdollah Rastigar, a member of the fanatical Fadayan Islam group.

March 19. Tehran, Persia. Abdol-Hamid Zamganeh, former Persian minister of education and a close friend of General Razmara, was shot on the steps of Tehran university; he died in hospital on March 25. A divinity student of the university, Nusratollah Abdol-Hossein Kumi, believed to be a member of Fadayan Islam, was arrested after the shooting.

May 11. Dalat, southern Vietnam, Indochina. M. Haaz, head of the French security services at Dalat, was assassinated by a member of the Vietminh.

July 16. Amman, Jordan. Riad es-Sulh, prime minister of Lebanon, 1943-45 and 1947-50, was killed while travelling in his car by three bullets fired from automatic weapons; of his assassins, a Palestinian and a Lebanese both believed to belong to the Syrian Nationalist party, one was killed by guards and the other shot himself.

July 20. Jordanian sector of Jerusalem. King Abdullah of Jordan was shot dead while entering the El-Aqsa mosque; the assassin, who was killed by the bodyguard, was Mustafa Shukri Ashu, a member of the "Holy War" organization which fought the Jews in Palestine, 1948-49. Musa Abdullah

el-Husseini (a cousin of the ex-mufti of Jerusalem), Abdel Kadir Farahat and the brothers Abed Mahmud and Zakaria Mahmud Okka were executed at Amman on Sept. 4 for direct complicity in the murder; the ringleaders, Colonel Abdullah el-Tel and Musa Ahmed el-Ayubi, had escaped to Cairo. The Husseini, a prominent Jerusalem family other members of which were arrested in connection with the assassination, were leaders of the "Holy War" organization.

July 31. Sadec, southern Vietnam, Indochina. The governor of southern Vietnam, Thai Lap Thanh, and General Charles M. F. Chanson, French commissioner and commander of French Union forces in the province, were killed by a Vietminh "death volunteer"; the assassin set off two hand grenades in his own trouser pockets and was also killed instantly.

Sept. 1. Sadec, southern Vietnam, Indochina. Vietminh agents killed Ho Van Frao, leader of an important youth organization and owner of a printing and publishing house at Sadec.

Oct. 6. Kuala Kubu-Pahang road, near Fraser's Hill, Malaya. Sir Henry Gurney, high commissioner for the Federation of Malaya, was ambushed and shot dead by Communist terrorists.

Oct. 16. Rawalpindi, Punjab, Pakistan. While addressing a public meeting Liaquat Ali Khan, the prime minister of Pakistan, was shot dead by Syed Akbar, a member of the quasi-fascist Moslem Khaksar organization.

Oct. 30. Pnom-Penh, Cambodia, Indochina. Jean de Raymond, French commissioner in Cambodia, was stabbed to death in his sleep by his Vietnamese houseboy.

Nov. 29. Bremen, Germany. Adolf Wolfard, editor of the *Bremer Nachrichten*, was killed in his office by a parcel-bomb, believed to have been posted by a neo-Nazi at Verden.

Dec. 29. Near Hyderabad, India. Maniklal Gupta, a member of the Indian parliament, was shot dead by an unknown assassin.

ASSOCIATION FOOTBALL: see FOOTBALL.

ASTRONOMY. Instruments. The year 1951 was noteworthy for the variety of new instruments being brought into operation. The Armagh-Dunsink-Harvard 36-in. "Baker-Schmidt" telescope, operated jointly by the three observatories named and installed at the Harvard station, Bloemfontein, South Africa, was reported as giving high performance. Its photographic plate covered about 18 square degrees of the sky, giving detail hitherto unattainable for such a large field by any telescope in the southern hemisphere. Its first programme was to secure stellar magnitude standards in selected areas of the southern sky. An objective prism for the instrument was being completed and was to be the largest in the world. The largest telescope in that hemisphere was still the 74-in. reflector of the Radcliffe observatory, Pretoria, and its spectrograph was installed in 1951. The mounting of a similar telescope, under construction for the Mt. Stromlo observatory, Australia, was shown at the Festival of Britain exhibition.

The first of the new "super-Schmidt" meteor cameras to be constructed was installed at the Harvard station in New Mexico. It was estimated that it would record some 40 times as many meteors as any previous meteor camera. Comparison of observations made by it and by other similar instruments to be located elsewhere would give details of the meteor trajectories.

A new chromospheric telescope for the Pulkovo observatory, U.S.S.R., was described. A branch of the Rome observatory at Monte Mario (7,000 ft.) in the central Apennines was nearly complete and observations were begun with a coronagraph. The main instrument was to be a 36-in. Schmidt telescope.

The 36-in. Baker-Schmidt telescope which in 1951 was installed at the Harvard station, Bloemfontein, South Africa.

The solar corona was observed for the first time without a total eclipse of the Sun in 1930 by B. Lyot using his newly invented coronagraph. In subsequent years Lyot greatly improved his techniques, especially by using the new interference filters developed by himself and others. Until 1950, however, the observations still required very favourable atmospheric conditions to be found only at great heights above sea level. Some details were published of a method by which Lyot then succeeded in overcoming this handicap. It consisted in using filters, which would transmit in a wavelength interval of only about one angstrom unit, to compare the radiation intensity outside the solar limb at the wavelength of the green coronal emission line with that at wavelengths a few angstrom units on either side of this line. The excess at the line was, of course, due to the corona itself, and could be measured at normally situated observatories.

Remarkable astronomical photographs were published which had been taken with a camera of novel type designed by L. G. Henyey and J. L. Greenstein and constructed at the Yerkes observatory, Wisconsin, U.S. This instrument covered the astonishing field angle of 140° with fine definition. The light was gathered by a concave mirror of large curvature and the curvature of the image was compensated by a camera lens of novel design. The photographs were like naked-eye views of the sky. They were specially adapted to the study of large areas of diffuse luminosity and the first application was to the difficult task of recording the "counter-glow." Excellent pictures of aurorae were also obtained.

This instrument also produced photographs of hydrogen emission regions of interstellar matter, and it is interesting to note that filters of the type used by Lyot were also being used in the direct photography of these regions. Thus new techniques were beginning to yield much-needed additional observational results on this fundamental subject of interstellar material.

Solar System. A huge recalculation of the motions of the five outer planets was reported from the United States. It was organized by Dirk Brouwer (Yale University observatory) and G. M. Clemence (U.S. Naval Observatory) and the bulk of the computation, necessitating over 12 million

The giant spot that crossed the sun's disk from May 9-22, 1951. The spot was the third largest in the records of the Royal Greenwich observatory since 1874.

arithmetical operations, was done by the selective sequence electronic calculator of International Business Machines, New York, under the direction of W. J. Eckert. This machine made it possible to use a method, that of "special perturbations," which it had previously been practicable to apply only to simpler problems and in a less accurate form. The paths of all five planets were traced out for the years A.D. 1653 to 2060 and gave immensely improved agreement with observed positions as compared with previous methods. So far as these planets were concerned, this work was expected to supply the needs of nautical almanacs for the next 100 years.

Following its discovery in 1949 by G. P. Kuiper, Neptune's second satellite Nereid had been observed by G. van Biesbroeck. Its orbit was found to have greater eccentricity than that of any other known satellite in the Solar system, the

distance from Neptune varying between 830,000 and 6,100,000 mi. The provisionally deduced mass of Neptune was some 3% greater than the value from the inner satellite.

As for many years past, work on cosmic rays was vigorously pursued. However, despite much theoretical investigation, no considerable progress appeared to be made concerning the astronomical origin of the primary cosmic rays entering the Earth's atmosphere from outside. The difficulty was still the relatively small amount of direct observational information about the "primaries" (most observations being of "secondaries" produced in the atmosphere). Therefore much interest attended the results obtained by workers from the Universities of Minnesota and Rochester, U.S., by sending balloons with recording apparatus to heights of about 100,000 ft. At the latitude of Minnesota, they found the main constituents of the primary rays entering the top of

the atmosphere per sq. cm. per hr. to be about 4,000 protons, 500-1,000 α -particles, 20 carbon nuclei and one iron nucleus. But they concluded that the nuclei of all elements up to atomic number about 40 are present and that their relative abundances are about the same as in solar and planetary material. The energies of the nuclei appeared to be roughly proportional to their positive electric charge and some nuclei had estimated energies exceeding 2×10^{10} ev. In 1947 C. A. Bauer had proposed a different way of obtaining such information: he remarked that meteorites before reaching the Earth must have been exposed to the primary cosmic rays which would be expected to produce induced radioactivity in the meteoric matter. H. Stücklen published an investigation which appeared definitely to confirm this effect. However, it appeared that such an investigation would need to be done on freshly fallen meteoric material in order to give results of quantitative value.

Stars. Among long-term programmes of observation and collation of results that were proceeding with accustomed vigour may be mentioned the work on radial velocities done at Mt. Wilson, California, U.S., with other American observatories collaborating, and at Simeis, Crimea, U.S.S.R.; that on bright-line stars at Mt. Wilson and at Bloemfontein, South Africa, under the auspices of the University of Michigan; and that on variable stars particularly by the Soviet astronomers.

E. M. Lindsay published from Armagh observatory, Northern Ireland, a study of the distribution of stars brighter than photographic magnitude 14 in the southern Milky Way. The star counts were made from plates taken at the Harvard station in South Africa. Among other purposes, such studies are important for giving information about the distribution of obscuring material in interstellar space. While Lindsay's work showed the expected general concentration of obscuration towards the galactic plane, it showed also some clear regions surprisingly near that plane. Why the distribution of the material should be such as to permit the existence of these "windows," which astronomers had recognized for some time, was still unexplained.

Radio Astronomy. The work of M. Ryle and his colleagues at Cambridge, England, was a notable example of the new and more systematic study of "radio stars"; *i.e.*, discrete sources of radio waves in the heavens. They had developed a radio interferometer whose use gave greatly improved resolving power for the detection and location of these "stars." In 1951 they published a preliminary survey of such "stars" in the northern hemisphere. This comprised 50 "stars," and these did not show a concentration towards the galactic plane as the general background radio radiation from the Galaxy had been observed to do. Therefore the 50 "stars" were presumably either the nearer members of an aggregate within the Galaxy or objects outside the Galaxy. These observers favoured the former interpretation and concluded that the majority of the "stars" were a hitherto unobserved type of stellar body about as abundant as ordinary stars. Generally similar observational results were obtained by Australian workers for "stars" in the southern hemisphere.

Late in 1950 R. H. Brown and C. Hazard of the Jodrell Bank station of Manchester university had announced the measurement of radio radiation (about 2 m. wavelength) almost certainly originating in the Great Andromeda nebula; *i.e.*, in a galaxy outside the Milky Way. In 1951 the Cambridge observers confirmed such a result for four conspicuous external galaxies including the Andromeda nebula. The measured intensities were about what would be obtained if each of these galaxies gave the same absolute emission as the whole Milky Way.

The most important constituent of interstellar matter is

neutral atomic hydrogen in its ground state. Astronomers had known this for some years from various lines of inference but had no means of directly observing the hydrogen in this state. Following a theoretical prediction by H. C. van de Hulst, a remarkable success of radio astronomy was to provide a means. Quantum theory shows that hydrogen has two ground states with an energy separation corresponding to radiation of 21 cm. wavelength. Though the interstellar matter was believed to comprise on the average only about one atom per cu. cm. capable of emitting a quantum of this radiation about once in 10 million years, it was calculated that the total resulting intensity could be detected by radio methods. This was verified by observers at Harvard university and in Australia. But more extensive work was done by C. A. Muller and J. H. Oort at Kootwijk, Holland. Developments of this were expected to give new information about the distribution of interstellar gas and also about the structure of the central region of the Galaxy.

External Galaxies. As observations accumulate, the study of any class of astronomical objects has always revealed an ever-increasing variety of properties. Current work on external galaxies was a notable illustration of this. Investigations reported by H. Shapley, Harvard, U.S., and preliminary inspection of results coming from the new equipment at Mt. Palomar, California, U.S., showed a greater range in size of individual galaxies and a greater variety of composition of "groups," "clusters" and "clouds" of galaxies than had been known before. M. Humason with the 200-in. telescope at Mt. Palomar measured the speeds of recession of three very remote clusters, obtaining values of about one-fifth the speed of light. (W. H. McC.)

BIBLIOGRAPHY. L. H. Aller, *Astrophysics* (Philadelphia, 1951); J. B. Sidgwick, *Introducing Astronomy* (London, 1951); W. M. Smart, *The Origin of the Earth* (Cambridge, 1951).

ATHLETICS. The season of 1951 was not so productive of new world records as other postwar seasons. Not a single men's world record for a standard Olympic event was broken. E. McD. Bailey (Great Britain), however, added his name to those of four Americans who share the best 100 m. time of 10.2 sec. and the general level of performance throughout the world rose markedly.

Several records in the more rarely contested events were improved. Apart from the prodigies performed by the Czech distance runner E. Zatopek, new figures were, curiously enough, the exclusive preserve of British and Soviet athletes. The absence of an American from among the new world record holders was significant, for the United States had long been regarded as the training ground for the best athletes. Nevertheless, the clearance by four U.S. athletes of 6 ft. 9 in. in the high jump during the year and the existence of six U.S. javelin throwers capable of distances of 225 ft., and three pole vaulters who have scaled 15 ft., represented an overall excellence never before attained. On the other hand, the gap of a foot between the 25 ft. 9 in. and the 24 ft. 9 in. of the season's third- and fourth-best long jumpers demonstrates how far competitors in 1951 fell short of the standards achieved at Berlin in 1936 in this particular event.

Nationally, the improvement of the U.S.S.R., Germany and Yugoslavia was most striking. The first U.S. team to tour Japan since the war met evidence of a revival there too. France and Sweden suffered heavy defeats in their international fixtures. Finland, host in 1952 for the 15th Olympic Games, showed a timely return to something of its former greatness.

The improvement of Great Britain, with new national records in 11 different events, continued, although its standards in long jumping and discus throwing remained obstinately low. It was becoming increasingly clear that the

only direction in which its international fixtures could be extended was to Germany and the U.S.S.R.

Women's athletics made little further headway in those countries, such as Sweden and the U.S., where they had never been fully accepted. In France, Italy and Holland there was little of note but great progress was made in the U.S.S.R. as a result of mass physical culture programmes. Russia continued to dominate the long distance and throwing events and Commonwealth countries consolidated their superiority in the sprint races.

In 1951 the Asian Games were held at New Delhi, the Mediterranean Games at Alexandria and the Pan-American Games (see below) at Buenos Aires. All these regional gatherings were inaugural and showed the continued increase of international competitions. The standard of performances at the Asian Games, which were won by Japan, was low and teams of French and U.S. athletes respectively tended to dominate the other two meetings.

In Great Britain the 1950-51 cross country season closed with an English victory over France and Belgium over a waterlogged course at Caerleon in South Wales. Oxford defeated Cambridge for the fourth successive year and their combined forces regained the Kinnaid trophy and also handsomely defeated (for the fourth time since 1935) the U.S. universities of Harvard and Yale in their 52-year-old series of matches.

The 62nd Amateur Athletic association championships were attended by a record crowd of 44,000. Among the most notable of many great performances were a half-mile by the Jamaican A. S. Wint in 1 min. 49.6 sec. and a mile by R. G. Bannister in 4 min 7.8 sec. Both these performances were the best recorded anywhere in the world during the 1951 season. (N. McW.)

United States. Bob Richards, Illinois Athletic club, won the pole vault with 15 ft. 4 $\frac{3}{4}$ in. in the *Chicago Daily News* meet. Three times in outdoor contests Richards achieved 15 ft. or more and added to his laurels by capturing the national decathlon championship with 7,834 points.

Jim Fuchs, New York Athletic club, pushed his indoor shot-put mark up to 58 ft. 3 $\frac{1}{2}$ in. Although he retained his championship indoors, Fuchs was dethroned in the national Amateur Athletic union outdoor games at Los Angeles when Parry O'Brien of the Los Angeles Athletic club put the shot 55 ft. 9 $\frac{1}{2}$ in.

Fred Wilt, New York Athletic club, was the nation's leading distance runner and ended the long string of mile victories by Don Gehrmann when he won by six yards in 4 min. 8.4 sec. in New York, March 3. On April 28, however, at Philadelphia, Roger Bannister of England defeated both Wilt and Gehrmann in the Benjamin Franklin mile in 4 min. 8.3 sec. Wilt was also timed at 8 min. 54.5 sec. for the fastest two miles ever covered by an American and won the national A.A.U. indoor mile and the outdoor 5,000-m. titles.

Roger Bannister winning the one mile A.A.A. championship at White City in July 1951 from G. W. Nankeville (No. 1) and H. Parlett (No. 15). His time of 4 min. 7.8 sec. beat the previous record by 1 sec.

Roscoe Browne, Pioneer club of New York, who won the A.A.U. 1,000-yd. championship, returned the fastest time of the year, 1 min. 49.3 sec., for 800 m. in an overseas meet, and ran 1,000 m. in 2 min. 25.2 sec. Mal Whitfield gained his third straight title in the A.A.U. 800-m. race when he defeated Browne.

Jim Golliday, Northwestern university, George Brown, University of California, and J. Lewis Hall, University of Florida, were among the newcomers to sparkle. Golliday reached the heights in the United States outdoor games at Los Angeles when he tied for the championship record of 10.3 sec. for 100 m. With Andy Stanfield of Seton Hall slowed by injury, Golliday gained distinction as the season's top sprinter. Stanfield, however, remained a star performer, winning the A.A.U. indoor long jump and the Intercollegiate A.A.A.A. 100-yd. and 220-yd. outdoors and 60-yd. sprint and long jump indoors.

Pan-American Sports Congress. This was held at Buenos Aires, from Feb. 25-March 9. The U.S. track-and-field team

BRITISH ATHLETIC PERFORMANCES, 1939 AND 1951

Event	Best Performance		Tenth Best Performance	
	1939	1951	1939	1951

ATOMIC ENERGY. While a considerable amount of information on the scientific and civilian aspects of atomic energy was published in western countries during 1951, various official and semi-official pronouncements made it clear that much the greatest effort in this field was being directed towards the development of military weapons. In the United States atomic artillery shells of various calibres were said to be in production as well as atomic bombs, and work on thermonuclear explosives (the hydrogen bomb) continued. Contracts were announced for the construction of an atomic-powered submarine and (as a longer-term project) an atomic-powered aircraft. Following an announcement by President Harry S. Truman on Oct. 3 that a second atomic bomb had recently been exploded in the Soviet Union, Joseph V. Stalin gave an interview to *Pravda* on Oct. 6 in which he said that "tests of atom bombs of different calibres will be conducted in the future as well in accordance with the plans for the defence of our country." Attempts towards establishing international control of atomic energy through the United Nations were continued in a U.S. proposal that a commission should be established under the Security Council to deal with the control of both atomic and conventional armaments. However, Stalin described the U.S. proposals for control as a "mockery," because they envisaged limitation rather than total prohibition. The deadlock, and the accelerated arms race, seemed likely to continue. On Oct. 22 the White House announced that another atomic explosion had taken place in the U.S.S.R.

International. At a U.N.E.S.C.O. conference in May scientists of Great Britain, France, Italy, Switzerland, Belgium, the Netherlands, Sweden and Norway met to discuss the possibility of building a European regional laboratory for nuclear physics. The main piece of equipment would be a circular accelerator (cosmotron) to give particles of energy several thousand million electron-volts. It was agreed to prepare definite plans for submission to the governments concerned. The object of the proposals was to promote international scientific co-operation by providing a centre where fundamental work on high-energy physics could be pursued by scientists from all nations.

Great Britain. Prospects for using atomic energy as a source of industrial power were reviewed in a report of the Advisory Council on Scientific Policy. It was expected that at least a generation would pass before atomic power stations could contribute substantially to Britain's power resources. Nevertheless there was a reasonable prospect that atomic energy could be developed on a large scale, and that costs would not in the end differ widely from those of power from coal.

The technical problems to be solved were outlined by Sir John Cockroft (*q.v.*), director of the British Atomic Energy Research establishment at Harwell, England, in a lecture delivered in Copenhagen in April. They included: (1) operation of atomic piles at sufficiently high temperatures for thermodynamic efficiency, (2) heat transfer from the pile to the power unit, (3) mechanical design to allow for changing of the fuel elements, (4) maintenance of the heat transfer system despite the intense radioactivity, (5) disposal of radioactive waste products. Cockroft expected that development would begin with small-scale pilot plants using uranium enriched in the isotope U^{235} . This might lead to mobile power units (*e.g.*, for submarine or aircraft propulsion as indicated above), but the expense of the enriched uranium would be

prohibitive at first from a commercial point of view. Natural uranium reactors would possibly provide electrical power at a cost similar to that from coal, but the efficiency of utilization of the uranium would be only about 1%. Full utilization of the uranium might become possible with the development of "breeder" reactors. These would require highly enriched uranium or plutonium as the primary fuel, but would be able to convert all the U^{238} in natural uranium into fissile material and so increase the supply of nuclear fuel by a factor of a 100.

Technical details of "Bepo" (British Experimental Pile), the larger of the two experimental piles at Harwell, were released by the Ministry of Supply in April. "Bepo" was described as a graphite-moderated and air-cooled pile containing up to 40 tons of uranium and with a maximum thermal neutron flux of 10^{12} neutrons/cm.²/sec. "Bepo" had been used for pure research, for studies of the effects of radiations on structural materials and for production of the radioactive isotopes used in medicine and industry. In the first six months of the year 961 consignments of isotopes were exported as compared with 483 in the corresponding period of 1950. A conference in Oxford on isotope techniques was attended by medical and industrial scientists from Great Britain and the continent, and regular courses at graduate level were instituted at the Isotope school at Harwell.

The Ministry of Supply confirmed that the United Kingdom was proceeding with the development of atomic weapons, and promised a further statement before any tests were carried out. A Civil Defence Tactical study was opened by the parliamentary under secretary to the Home Office on July 10, and civil defence problems were also touched upon at the Building Research conference in London during September.

Strong criticism of the slowness with which atomic weapons were being developed in the United Kingdom was voiced in a House of Lords debate on July 5. Lord Cherwell called on the government "to transfer work on this subject from the Ministry of Supply to a special organization, more flexible than the normal civil service system, under the direct control of the head of the government." He considered the existing arrangements to be unsatisfactory because of the delays in the administrative machinery and the inadequacy of the security precautions.

Commonwealth. Reports from the Commonwealth referred to intensive mining activity for uranium and thorium in Canada, South Africa, South Australia and Ceylon. In Canada plans were announced for the construction of another heavy water pile at Chalk river.

Europe. In Europe, the Norwegian-Netherlands reactor at Kjeller, near Oslo, began operation on July 30. The seven tons of heavy water for the pile were supplied by Norway, the three tons of uranium by the Netherlands. The pile was built to provide a supply of isotopes for the Scandinavian countries, the Netherlands and Belgium. Work continued on the building of a second (heavy water) reactor at Saclay, near Paris, France, and of a low-energy reactor at Stockholm, Sweden. The largest nuclear fission apparatus in continental Europe was the synchrocyclotron put into operation in Amsterdam in 1951 by the Netherlands Atomic Energy commission. Though its voltage was only 30 million electron-volts, it had the highest current rating of any cyclotron in existence, from 20 to 40 micro-amperes. (H. R. A.)

Argentina. On March 24, 1951, President Juan D. Perón announced that a process employing a thermonuclear reaction for the controlled release of atomic energy had been perfected by Argentine scientists under the direction of Ronald Richter, Austrian-born director of the Argentine atomic energy project. The announcement was greeted with extreme scepticism by scientists in the United States and Europe.

United States. Four series of atomic test explosions were

staged by the United States in 1951. The first series took place at Frenchman's Flat, part of the air force bombing and gunnery range on a 5,000-sq.mi. tract of land about 75 mi. from Las Vegas, Nevada. Five atomic explosions were set off on Jan. 27 and 28 and Feb. 1, 2 and 6. The second explosion seemed to be three times as powerful as the first; the dazzling flash and the thunderous noise were observed 200 mi. away in Arizona, southwestern Utah and south-eastern California. The fifth explosion was the largest of the group. The flash was seen 250 mi. south of the Mexican border, a distance of 500 mi. from Las Vegas. It was believed that the five explosions were preliminary tests of tactical atomic bombs.

The second series of tests—operation "Greenhouse"—was held at the Eniwetok proving grounds in the Marshall Islands in April and May. It was believed that four bombs—apparently several times more powerful than those exploded over Hiroshima and Nagasaki—were set off; there was speculation about the possibility that an atomic bomb had been exploded in conjunction with hydrogen isotopes to test the ability of an atomic bomb to "trigger" the thermo-nuclear reaction required for a hydrogen bomb.

The tenth semi-annual report of the Atomic Energy commission revealed that the Eniwetok tests demonstrated that lingering radioactivity after an air burst need not delay rescue and recovery work. After explosions, many scientists and technicians promptly returned to the test sites for sufficient periods to recover instruments and specimens. Anaesthetized mice, dogs and pigs had been exposed to the explosions.

The third series of tests took place at Yucca Flat, east of Frenchman's Flat, Nevada, in October and the first week of November. Five explosions were set off. It was believed that they were the final tests of revolutionary new tactical atomic weapons originally tried out in the first series of explosions of the year. The second explosion of this series was that of a bomb dropped from an aeroplane (Oct. 28) which observers believed to be a test of a small "air-to-ground" atomic bomb for use against ground troops. The third explosion (Oct. 30) was also that of a bomb dropped from an aeroplane. It exploded at about 1,000 ft. with a dazzling flash and the formation of a fireball. The blast was seen 270 mi. away and observers agreed that it was several times bigger and brighter than the previous explosion. The general opinion was that this was a compact, tactical bomb with the explosive violence of the strategic bomb set off at Bikini. The fifth explosion (Nov. 5) was the most powerful of the series.

The 1951 tests came to an end with a fourth series consisting of two nuclear explosions at Frenchman's Flat on Nov. 19 and 29. The final explosion was believed to have been an underground detonation, the first of its kind ever attempted.

Exercise "Desert Rock"—the first simulated atomic warfare manoeuvre in history—was held at Yucca Flat on Nov. 1 in conjunction with the explosion of the fourth bomb in the third series of tests. About 5,000 officers and men of the army, navy and air force took part or were present as observers. The chief participant was a reinforced battalion combat team of about 1,000 men, who set up simulated battlefield positions of a normal type with foxholes, barbed wire entanglements, etc. They then withdrew, leaving behind, however, equipment, scientific measuring instruments and a number of anaesthetized sheep, dogs and rats. The entire armed force contingent, as well as about 2,000 other observers, including congressmen, government officials and scientists, took up their stations at positions from six to ten miles from the "battlefield."

The bomb, dropped from an aeroplane, exploded at an

estimated altitude of 1,000 ft. After the explosion, the combat team returned to its "battlefield" positions to examine the damage that had been done to exposed equipment and the anaesthetized animals.

U.S. and Soviet Atomic Strength. It was difficult to evaluate the comparative atomic strengths of the United States and the U.S.S.R. during 1951 because neither had disclosed the essential information for such a comparison. It was generally assumed that the U.S. had a stockpile of about 1,000 strategic atomic bombs, while the U.S.S.R. was believed to have less than 50. The most formidable U.S. bomb was certainly more than two and a half times as powerful as the bomb exploded at Nagasaki; indeed it might be as much as six times as powerful. Although the United States had not yet achieved a hydrogen bomb, it was assumed that the Atomic Energy commission was satisfied that one could be built.

The expanded atomic energy programme embarked upon by the United States in 1950, following the announcement of the first atomic explosion in the U.S.S.R., was further enlarged in 1951. Congress appropriated more than \$2,000 million for the U.S. Atomic Energy commission in the fiscal year 1951. Nearly three-quarters of this was spent on construction and equipment.

The Atomic Energy commission increased its supplies of raw material and its output of fissionable material during the year. Deliveries of uranium concentrates from the Belgian Congo and from Canada continued at scheduled rates. Domestic production increased to the point where the United States became second among the free nations in the mining and processing of uranium ores. The commission expanded its programme of exploration of possible ore reserves in the United States. Progress was made during 1951 on two new important production plants. One was the plant at Paducah, Kentucky, for the separation of uranium 235 from ordinary uranium by the gaseous diffusion process. The other, which would be capable of producing either fissionable materials or hydrogen isotopes, was at Savannah river, near Augusta, Georgia.

Atomic Propulsion. On Aug. 21, 1951, the U.S. navy's bureau of ships announced that a contract for the first atomic-powered submarine had been given to the Electric Boat company of Groton, Connecticut. Subsequently a contract for the driving mechanisms of the submarine was awarded to the Westinghouse Electric corporation. It was

A demonstration of a remote-handling device to students of the atomic energy school at the Atomic Energy Research establishment, Harwell, Berkshire, in April 1951.

believed that this company would also be commissioned to build the nuclear power plant for the submarine although both Westinghouse and the General Electric company had been working on the design of suitable nuclear reactors.

The U.S. air force announced on Sept. 5, 1951, that it had awarded a contract for the development of an atomic-powered aeroplane to the Consolidated Vultee Aircraft corporation, of San Diego, California. The General Electric company, it was announced, was working on the design of a nuclear power plant for such a plane. The problem was to design a plane capable of carrying the considerable weight of a nuclear reactor with its necessary shielding to protect the crew from radioactivity.

The United States Programme. Speaking in the Senate on Sept. 18, 1951, Senator Brien McMahon, chairman of the Congressional Joint Committee on Atomic Energy, proposed a vast expansion of the nation's atomic energy programme, increasing expenditure to \$6,000 million a year. He insisted that with mass-production methods it would be possible to manufacture an atomic bomb for the current cost of a tank. He called for the creation of "an atomic army and an atomic navy and an atomic air force."

Speaking in Los Angeles on Oct. 5, Gordon Dean, chairman of the Atomic Energy commission, made the first positive statement that the United States possessed tactical atomic weapons and that the time had arrived for considering their use on the battlefield. He stated that the weapons called for a revolutionary change in concepts of warfare and that their use against troops in the field, unlike the strategic bombing of cities, involved no greater moral considerations than the use of conventional battlefield weapons.

The Congressional Joint Committee on Atomic Energy unanimously adopted a resolution on Oct. 17 calling on the Department of Defence and the Atomic Energy commission to prepare by Jan. 3, 1952, a detailed programme for the maximum expansion of the role of atomic energy in national defence.

A report issued on Oct. 19 by the Congressional Joint Committee on Atomic Energy, under the title of "Development and Control of Atomic Energy," revealed that the experimental breeder reactor had been put into operation at the reactor testing station at Arco, Idaho. It was hoped that this reactor would create more atomic fuel than it consumed. The reactor used enriched uranium as fuel and a blanket of natural uranium around the core as the "fertile" area in which breeding could take place. Other reactors under construction at Arco included a materials testing reactor and a land-based prototype of a reactor for submarine propulsion. Long-range experiments included the design of a homogeneous reactor in which the atomic fuel was mixed with the moderating material in a liquid.

In June 1951 the U.S. Atomic Energy commission entered into agreements with four groups of industrial companies for joint studies of ways in which private firms might carry a larger share of the task of developing, building and operating nuclear reactors. The four groups were: Monsanto Chemical company and Union Electric company, both of St. Louis, Missouri; Detroit Edison company of Detroit, Michigan, and Dow Chemical company of Midland, Michigan; Commonwealth Edison company and Public Service company of Northern Illinois, both of Chicago; and Bechtel corporation and Pacific Gas and Electric company, both of San Francisco.

The U.S. Atomic Energy commission expanded the manufacture and distribution of radioactive isotopes during 1951. Isotopes were sent to 500 institutions in the United States and to 175 institutions in 31 foreign countries.

Research. Four new pieces of nuclear fission equipment, financed partly or entirely by the U.S. Atomic Energy commission, went into operation during 1951. They included cyclotrons at Oak Ridge National laboratory, Oak Ridge,

Tennessee, and Brookhaven National laboratory, Upton, New York, and synchrocyclotrons at the University of Chicago and the Carnegie Institute of Technology, Pittsburgh. At Brookhaven, the west face of the research reactor was partitioned off and "declassified" so that authorized scientists not "cleared" for access to restricted information could use that face of the reactor for non-secret experiments.

Production of plutonium in the gigantic reactors at Hanford, Washington, was accompanied by the accumulation of vast quantities of radioactive fission products. A search for industrial uses for these waste products was initiated with a study by the Stanford Research institute, Stanford, California. It was pointed out that five principal capabilities of fission products were the killing of organisms, the induction of chemical reactions, the ionization of gases, the activation of phosphors and the production of rays that penetrate solids. (See also MINERAL AND METAL PRODUCTION; PHYSICS.) (D. Dz.)

ATTLEE, CLEMENT RICHARD, British statesman (b. London, Jan. 3, 1883), was educated at Haileybury and University college, Oxford. For his early career see *Britannica Book of the Year 1951*. Attlee presided at the meetings of the Commonwealth prime ministers which opened in London on Jan. 4, 1951. He proposed the toast of Walter S. Gifford, United States ambassador, at the dinner on Feb. 2 of the English Speaking union. On March 13 he had talks in London with Alcide De Gasperi, the Italian prime minister, and Count Sforza, the foreign minister. He went into St. Mary's hospital, London, on March 21 to be treated for a recurrence of a duodenal ulcer from which he suffered in 1948 and was there until April 26, when he went to Chequers. On April 24 he had left hospital for some hours to attend the memorial service in Westminster abbey for Ernest Bevin. Attlee returned to London on April 30 to resume his full duties. Glasgow university conferred on him the degree of LL.D. when he attended and spoke at the quinquenary celebrations of the university, June 20-21. He flew to Edinburgh with Mrs. Attlee on Aug. 2, and they left in the frigate "Widemouth Bay" for a holiday in Norway. On Aug. 12, the last day of the holiday, they were entertained to lunch by King Haakon on board the royal yacht "Norge." In a broadcast on Sept. 19 Attlee announced that a general election would be held on Oct. 25. At the Labour party conference on Oct. 1 he introduced the party's election manifesto, and made another offer to the U.S.S.R.: the British government was ready "to meet and deal with the people on the other side of the Iron Curtain when they made a response, not only in words, but in action." With the leaders of the other parties he attended the pre-election service at St. Paul's cathedral on Oct. 4 and set out on his main election tour on Oct. 6; with 2 days' rest he made 53 speeches in 8 days. Mrs. Attlee drove him throughout the tour in their own car. He was returned with a majority of 11,574 in his constituency of West Walthamstow, but his party lost its majority and at 5 P.M. on Oct. 26 Attlee was received by King George VI who accepted his resignation. On Oct. 31 the parliamentary labour party re-elected Attlee leader of the party. He moved on Nov. 1 from the prime minister's residence at Downing street to Cherry cottage,

Great Missenden, Buckinghamshire, which he had bought in 1949. The king again received him on Nov. 5 and invested him with the insignia of the Order of Merit. He entertained Konrad Adenauer, Western German chancellor, to lunch at the House of Commons on Dec. 6. He was given the freedom of Leeds on Dec. 18.

AURIOL, VINCENT, French statesman (b. Revel, Haute-Garonne, Aug. 27, 1884), president of the French republic since 1947. For earlier career see *Britannica Book of the Year 1951*. In March 1951 he was called upon to resolve a cabinet crisis over the electoral laws and was nearly prevented by it from leaving for an official visit to the United States and Canada. He and Mme. Auriol, accompanied by Robert Schuman, the foreign minister, left on the "Ile de France" on March 20 and arrived in Washington on March 28 for the first visit ever paid to the United States by a president of France while in office. His main theme in the 45 speeches he made in the United States and Canada was an outspoken defence of France against those who doubted its will to resist aggression. He explained recurring ministerial crises by saying that it was not the government team that was changed from time to time, but only the leader. In New York he received an honorary degree from Columbia university and left for Canada on April 5 to visit Ottawa, Toronto, Quebec and Montreal. A chain of mountains in southwest Yukon territory was named after him in honour of the visit. He left by air from Montreal on April 9 and reached Paris on April 10. Opening the U.N. general assembly at the Palais de Chaillot in Paris on Nov. 6, Auriol expressed the hope that a meeting might take place in Paris between the distinguished men towards whom all anxious eyes were turned for direct conversations on outstanding international problems. In a speech at a luncheon of the Foreign Press association on Nov. 15, Auriol spoke on the rôle of the president of the republic. He should be neither a presidential prop nor an exponent of personal rule. Between silence and indifference on the one hand and decision and effective action reserved to responsible government on the other, there was room for this moral magistracy (*magistrature morale*), for the power of advising, warning and conciliating which should be that of a head of state.

AUSTRALIA, COMMONWEALTH OF. Self-governing member of the Commonwealth of Nations, situated in the southern hemisphere. Areas and populations of the six federated states, Australian Capital territory and Northern territory are given in the table below.

In 1944 full-blooded aboriginals were estimated at 47,000 and half-castes numbered 24,881. Territories under the administration of the Commonwealth but not included in it comprise Papua-New Guinea (*q.v.*), Norfolk Island, the territory of Ashmore and Cartier islands and the Australian Antarctic territory. Language: English. Religion (1947 census): Anglican 2,957,032; Roman Catholic 1,569,726; Methodist 871,425; Presbyterian 743,540; Baptist 113,527; Lutheran 63,243; other Christian 354,443; Jewish 32,019; other non-Christian 4,543; indefinite and no religion 45,036; not stated 824,824. Chief towns (pop., 1949 est.): Sydney

(1,550,000); Melbourne (1,288,000); Adelaide (470,000); Brisbane (430,000); Perth (294,000); Newcastle (1947, 127,188); Hobart (1950 est., 84,000). Governor general, Sir William McKell; prime minister, Robert Gordon Menzies (*q.v.*).

History. The Liberal-Conservative government came into office in 1949 without a majority in the Senate. During the first quarter of 1951 outstanding events were the passage of the much-disputed Communist Party Dissolution act after the Labour party opposition had been suddenly withdrawn and other legislation, particularly the Commonwealth Bank Amendment act to restore control by a board, which the Labour-controlled Senate had held up. On the application of the government the governor general held that this bill had "failed to pass both houses" and a double dissolution was granted. In the election that followed the government was returned with a majority in both houses although that in the House of Representatives was reduced (*see ELECTIONS*).

H. V. Evatt, deputy leader of the Labour party led an application by several unions to the High court to test the Communist Party Dissolution act which affected trade union leaders alleged to be Communists. The court held the act to be unconstitutional. The government proceeded in the new parliament to enact law to hold a referendum to give it powers to pass the disputed bill into law and also to pass similar or related matters. The referendum was defeated by an absolute majority in the Commonwealth as a whole and in three of the six states. On June 13 the whole Commonwealth was overshadowed by the news of the sudden death in Canberra of J. B. Chifley, leader of the Labour party and former prime minister (*see OBITUARIES*). The funeral of the late prime minister deeply affected people throughout the nation. In Victoria an act to provide for the election of the legislative council by adult franchise was passed just 100 years after its establishment and 93 years after attempts were first made to secure such election.

Foreign Affairs. Australia's contribution to the Korean war continued with the engagement of all three arms of the services. The Japanese treaty was signed at San Francisco allowing Japan unrestricted economic and military powers. The treaty was supported by the Australian government but there was strong resistance from the Labour party with no occasion for a vote in the house. Australian foreign policy continued to move closer to that of the United States which offered Australia assurances of assistance in the event of attack. During the year a meat marketing agreement was signed with the United Kingdom under which Australian producers were guaranteed for several years 1951 prices as minima.

Industrial and Economic. There were few strikes and none of more than local significance. The most notable event was a marked increase in inflation. The "C" series retail price index for the six capital cities increased at an annual rate in the quarters as follows: June 1950 to Sept. 9.9%, Sept. to Dec. 17.1%, Dec. to March 1951 17%, March to June 27.5%. The federal metropolitan basic wage was £A 9 9s. in Sept. 1951, all the increase during the year (£A 2 14s.) being the result of automatic adjustment for price increases. The average weekly earnings of 80% of all wage and salary earners at March 1951 were £A 11 6s. 8d. Economic activity

States and Territories	Capital	Area (sq. mi.)	Population (1947 census) (Dec. 1950)	Prime Minister	Ministry

Part of a spectacular procession held in Sydney on Jan. 29, 1951, as part of the celebrations to mark the 50th anniversary of the Commonwealth of Australia.

continued at much above full employment level. The setback in wool prices had had no apparent deflationary effects by the end of the year. The average total personal income in 1950-51 was £A 2,916, an increase of 24% over 1949-50. There were 2,629,600 wage and salary earners in employment; nominal unemployment was shown at 0.8% and less.

The rise in the value of exports continued to be the main force behind inflation. Exports in 1950-51 were £A 984 million, an increase of £A 370 million, more or than three times the highest annual increase ever recorded before. Imports reached £A 742 million, an increase of £A 206 million on the year before. These factors in the balance of payments were unable to prevent a fall in overseas funds. The dollar loan obtained from the International Bank for Reconstruction and Development was allocated during the year. Its effect on capital imports could be seen in the percentage of producers' goods among total imports. In 1948-49 the figure was 22.1%, in 1949-50 it was 32.3%, and in 1950-51 27.5%. Expenditure of loan money earmarked for capital goods might have increased these percentages a little, but, at any rate, must have prevented them from falling to what they would otherwise have been. However, only about one-quarter of the goods which would be obtained from the loan had arrived by the end of the year.

The 1950-51 actual Commonwealth budget expenditure was £A 881 million and there was a net increase in government indebtedness during the year of £A 94 million; part of this was financed by loan money and part by the issue of treasury bills. Approximately 37% of revenue came from indirect taxes and 54% from direct. It was expected that the 1951-52 budget would maintain a high expenditure with an increase on war and defence to £A 200 million but there would be some reduction in other directions. The main anti-inflationary device of this budget was increased taxation, mainly indirect. The index of wool prices fell by 23% in April, 11% in May and 26% in June; there was no fall in July but August showed another slight fall. Taking all these matters into consideration it was possible that deflationary influences might be operating

in the Australian economy but this would depend particularly upon the level of U.S. and European buying.

Immigration and Housing. Permanent new arrivals during the year were 154,290. This meant a rate of increase based on existing population that had rarely been exceeded in any year of the last century of immigration to the new world. Easy absorption of immigrants into primary and secondary industries continued but the housing of them became more acute. During the year 1949-50 55,485 houses were completed, an increase of 4,146 on the year before. Although these were the highest figures ever reached in any one year they were still below the requirements of existing population demands for new houses and normal replacements.

Arts and Sciences. Lord Bruce was appointed first chancellor of the Australian National university. Professor G. Paton was appointed vice chancellor of the University of Melbourne on the retirement of Sir John Medley. During the year the Commonwealth celebrated the 50th anniversary of its foundation and the state of Victoria its centenary. A legal convention was held which brought to Australia leading legal figures of the British Commonwealth including Viscount Jowitt, the lord chancellor. J. B. Conant, president of Harvard, and Professor K. C. Wheare of Oxford university visited Australia during the year. The Edward Dyason trust lecturer was Salvador de Madariaga. Visiting artists included Yehudi Menuhin. During the year the Commonwealth government entered directly into the provision of finance for Australian universities. This departure from normal practice was necessary because of the increased requirements of the universities for larger student rolls and because of higher costs, the falling off in Commonwealth assistance for the training of servicemen and the final dependence of state governments upon the Commonwealth for revenue.

General. The most conspicuous feature of the year was high money incomes and inflation. In all fields money demand was so high that resources were strained beyond capacity. Inflation moved from a suppressed state into an open-air uncontrolled one. Politically, the characteristics were

uncertainty and lack of positive government action, much of the time of parliament being taken up with the abortive attempts to provide new legislation to deal with the Communist party. Again, in this respect, the difficulties in the way of changing the constitution were revealed. Some dangers to civil liberties were felt to be present from authoritative quarters but there was little of a positive or overt nature about them. War and defence continued to influence public discussion and activity. (See also AUSTRALIAN LITERATURE.)

(J. F. C.)

Education. Schools (1950): state 7,969, pupils 869,906, teachers 33,271; private schools 1,835, pupils 281,056, teachers 12,425; universities 8, students 33,000.

Agriculture. Main crops ('000 metric tons, 1949-50; 1950-51 in brackets): wheat 5,939 (4,981); oats 498 (471); barley 443 (517); maize 160; sugar, raw value, 959 (920); potatoes 481 (500). Livestock ('000 head, March 1950): sheep 112,891; cattle 14,640; pigs 1,123; horses 1,057. Wool production ('000 metric tons, greasy basis, 1949; 1950 in brackets) 503 (534). Milk production (million gal., 1949-50; 1950-51 in brackets): 1,252 (1,211). Food production ('000 metric tons, 1949-50; 1950-51 in brackets): butter 171.2 (162.4); cheese 45.6 (45.3); meat 1,067.8 (1,028.4), of which beef 618.6 (660.0).

Industry. Manufacturing establishments (1948-49): 40,010; persons employed, including working proprietors, 890,454. Fuel and power (1950; 1951, six months, in brackets): coal ('000 metric tons) 16,788 (7,836); lignite 7,416 (3,857); manufactured gas (million cu. m.) 1,064 (523); electricity (million kwh.) 10,251 (5,159). Raw materials ('000 metric tons, 1950; 1951, six months, in brackets): refined copper 13.8 (6.6); refined lead 203 (98); zinc 85 (37); pig iron 1,336 (616); steel ingots and castings 1,448 (668); gold ('000 fine ounces) 861 (429). Manufactured goods ('000 metric tons, 1950; 1951, six months, in brackets): wool yarn 21.5 (9.8); cement 1,278 (611). New dwelling units completed (1949; 1950 in brackets) 52,884 (61,884).

Foreign Trade. (£A million, 1950; 1951, six months, in brackets): imports 630 (408); exports 744 (593). Main sources of imports (1950-51): U.K. 48.1%, U.S. 8.2%, India 4.8%. Main destinations of exports: U.K. 32.5%, U.S. 15.2%, France 9.2%. Main imports: oils 10%; machinery 24%; piece goods 14%; vehicles 12%; oils 10%. Main exports: wool 65%; wheat and flour 11%; meat 3%; metals, minerals and ores 4%.

Transport and Communications. Roads (1946 est.): 50,497 mi. Licensed motor vehicles (Dec. 1950): cars 876,902; commercial 475,926. Government railways (1949-50): 26,980 mi.; passenger journeys 504.6 million; goods carried 40.6 million tons; train miles run 93.3 million. Shipping (merchant vessels of 100 gross tons and over, July 1950): 355; total tonnage 541,424. Air transport (1950): mi. flown 44 million; passenger mi. 788.0 million; freight, including mail, net ton-mi. 31.4 million. Telephones (March 1951): instruments 1,182,035. Wireless licences (March 1951): 2,074,775.

Finance and Banking. (£A million) Budget: (1950-51) revenue 783.6, expenditure 783.6; (1951-52 est.) revenue 1,041.5, expenditure 927.0. National debt (Dec. 1949; Dec. 1950 in brackets): 1,838.4 (1,850.9). Currency circulation (July 1950; July 1951 in brackets): 235 (275). Gold and foreign exchange (million U.S. dollars, March 1950; March 1951 in brackets): 1,431 (1,878). Bank deposits (July 1950; July 1951 in brackets): 867 (1,100). Monetary unit: Australian pound with an exchange rate of £A 1.25 to the pound sterling and £A 0.45 to the U.S. dollar.

See O. L. Ziegler, ed., *Jubilee of the Commonwealth of Australia: Official Commemorative Book* (London, 1951).

AUSTRALIAN LITERATURE. The year 1951 was mainly notable for the discussion aroused by three novels: Frank Hardy's *Power Without Glory*, the subject of an unsuccessful libel case, Eric Lambert's *Twenty Thousand Thieves*, a picture of the Australian soldiers' life in the middle east written with bitterness and left-wing bias, and Dal Stevens's *Jimmy Brockett*, a ruthless study of "a notable Australian." Other novels included Moira Gaskin's *Heaven Knows Where* which, like those of Lambert and Stevens, was a first novel, Catherine Gaskin's *All Else is Folly*, Eric Lowe's *O Willing Hearts*, and *Prelude to Waking* by "Brent of Bin Bin." Lambert, Stevens and Lowe had all worked under fellowships from the Commonwealth Literary fund, whose fellowships for 1951 were granted to Judith Waten, Victor Kennedy and Kylie Tennant.

Poetry included John Hiberny's *Nine Poems*, Nancy Keesing's *Imminent Summer*, H. E. Boote's *The Dim Rainbow and Other Poems*, D. G. Campbell's *For Friend and Fireside*,

and *A Book of Australian and New Zealand Verse* chosen by Walter Murdoch and Alan Mulgan. Walter Murdoch also, with Henrietta Drake-Brockman, made the selections for *Australian Short Stories* in the World's Classics series.

H. M. Green's *Australian Literature, 1900-1950* provided a concise and valuable guide, and A. P. Murphy's *Contemporary Poets* added a useful volume to Australian literary criticism. Two works of bibliography of importance appeared: the third volume covering the years 1839-1845 of J. A. Ferguson's monumental *Bibliography of Australia*, and George Mackaness's *Annotated Bibliography of Henry Lawson*.

(C. A. Br.)

AUSTRIA. Republic of central Europe. Area: 32,375 sq. mi. Pop.: (1939 census) 6,652,720; (1951 census) 6,881,100. Language: German 98%; other 2% (mainly Slovene in Carinthia). Religion (1939): Roman Catholic 88.27%, Protestant 5.35%, Jewish 1.26% (0.2% in 1945), other 5.12%. Principal towns (pop., 1951 census): Vienna (cap., 1,760,784); Graz (226,271); Linz (185,177); Salzburg (100,096); Innsbruck (94,599); Klagenfurt (62,792). President, Theodor Körner (*q.v.*); chancellor, Leopold Figl. The Austrian government had jurisdiction throughout Austria, with certain limitations regarding matters control over which was reserved to quadripartite decision in the Allied Council for Austria. By Dec. 31, 1951, members of the A.C.A. were: France, Jean Payart; United Kingdom, Sir Harold Caccia; U.S., Walter S. Donnelly; U.S.S.R., Lieut. General V. P. Sviridov.

History. Throughout 1951 unsuccessful attempts were made to persuade the Soviet government to do away with the special permits necessary to enable citizens of the three western occupants to travel through the Soviet zone. The British and U.S. commercial airports respectively at Schwechat and Tulln (both in the Soviet zone) continued to operate without restrictions. Attempts to induce the Soviet government to sign the Austrian peace treaty were again unsuccessful. The points of difference on the treaty itself were narrowed down to four minor ones but the Soviet government made its signature dependent on acceptance by the west of various matters, such as the status of Trieste, entirely unconnected with the treaty.

In these circumstances, the Austrian scene continued to be dominated throughout the year by the wider question of the relations between the four Great Powers. While the U.S. government poured \$104,360,000 into Austria through the medium of the E.R.P. (July 1, 1950, to June 30, 1951), the Soviet government took at least \$50 million out through the network of ex-German firms and undertakings administered by the U.S.I.A. (Upravlenye Sovetskimi Imushchestvom v Avstrii, or Administration of Soviet Properties in Austria). About one quarter of this sum was the value of oil from the wells round Zistersdorf in the Soviet zone of Austria. During the year, the U.S.I.A. extended its operations by setting up a large number of retail stores in the towns of the Soviet zone and the Soviet sector of Vienna. The U.S.I.A. stores imported goods free of customs duty and most of them, like the U.S.I.A. factories, did not pay taxes or social insurance contributions. Consequently they competed on specially favourable terms with Austrian private enterprise. The non-Communist political parties called on their followers to boycott the U.S.I.A. stores and most Austrians did so.

In spite of E.R.P. help, the Austrian economy again found itself in serious difficulties. A new wage-price agreement (the fifth since Aug. 1947) had to be negotiated in July 1951. This was followed by an all-round increase in rents in the autumn. Though the changes were not accompanied by Communist-inspired riots as in 1950, they meant hardship

for many people. The prices of many consumer goods and also bread were subsequently reduced slightly but the economic crisis was not solved. Austrian imports during the year, excluding Marshall aid, were greatly in excess of exports and it was clear that production would have to be raised if the country was to avoid a drastic decline in its standard of living.

Considerable progress was made during the year in developing Austria's water power resources. The first half of the giant hydro-electric station at Kaprun which harnesses water from glaciers around the Grossglockner was completed in Sept. 1951. Electrification of the Austrian railway system also progressed considerably. Reconstruction of buildings destroyed during World War II continued on an increased scale. Thanks largely to this, unemployment which reached the high level of 219,490 in February fell to 79,581 in June 1951. This was the lowest figure recorded since the war. On the other hand there was a serious shortage of coal, and all Austria's suppliers, especially the Ruhr, Poland and Czechoslovakia, raised their prices as well as cutting supplies.

Much of the reconstruction in all fields was the result of the release of E.R.P. counterpart funds. In September, General Sviridov, the Soviet high commissioner, accused the three western occupants of remilitarizing Austria under the pretence of reconstruction. His accusation, raised under the heading "other business" at a meeting of the Allied council, touched off a furious campaign in the Communist press. The Austrian "Peace council" later published a *White Book* of specific charges which was given to the delegates of the World Peace council who met in Vienna in November. At a meeting of the Allied council on Nov. 30, the Soviet representative brought forward a resolution in two parts, one calling for a quadripartite commission of inspection and the other requiring the council to write to the

Theodor Körner, the successful candidate, voting in the Austrian presidential elections on May 27, 1951.

federal chancellor ordering him to reduce the number of gendarmerie, cease the construction or reconstruction of military installations, switch all military production to peacetime needs and repeal various measures aiming at remilitarizing Austria. The U.S. representative tabled a substitute resolution which declared that internal security was the affair of the Austrian government, demanded the restoration of inter-zonal freedom of movement so that everyone could judge the truth of the militarization charges for themselves and the immediate signing of the peace treaty. All three western representatives dismissed the Soviet charges as having been advanced purely for propaganda purposes.

In the political sphere, the year was marked by the election at the second ballot on May 27, 1951, of Theodor Körner, formerly Socialist burgomaster of Vienna, as president of the republic in succession to Karl Renner who died on Dec. 31, 1950. Relations between the three western occupants and the Austrian government continued to improve. Progress was also made in dealing with the grievances of Austrians in the South Tirol and in establishing more friendly relations between Austria and Yugoslavia, which dropped all territorial claims against Austria in the course of the year. The three western occupants agreed to the Austrian request to elevate their mission to the rank of embassy. The Soviet reply was expected to be favourable. But the Soviet government refused to accept the Austrian proposal, supported by the three western occupants, to abolish the so-called Austrian censorship. Accordingly, on Nov. 21, the Austrian postal authorities gave notice to all the 863 employees of the department that their employment would cease on Jan. 1, 1952. If, as expected, the Soviet element still refused to discontinue the censorship they would have to be taken on to the strength of the occupation forces after that date. The Austrian government also failed to get satisfaction from the Soviet authorities on the subject of prisoners of war and Austrian political prisoners in the U.S.S.R. Such prisoners were, however, allowed to write to their families after Sept. 5, 1951. It was learned from one of these letters that the Austrian chief inspector of police, Anton Marek, who disappeared in June 1948, had been sentenced to 25 years for anti-Soviet activities. A number of other Austrians serving sentences in the Soviet Union were released during the year but were unable to leave the U.S.S.R. because they could not obtain the necessary permits.

During the year, Austria was again host to a number of persons and organizations from abroad. The World Scout jamboree held at Bad Ischl in August attracted some 15,000 scouts from all over the world. In September the British Iron and Steel institute held a joint session with the Austrian institute at Graz, Styria. A less welcome arrival was the secretariat of the World Federation of Trade Unions which established itself in Vienna under Soviet protection in April.

In the 1950-51 winter an unprecedented series of avalanches struck the alpine districts of Austria causing over 100 deaths and damage calculated at £2 million. (G. Ls.)

Education. Schools (1949-50): elementary and private 5,073, pupils 846,846, teachers 35,874; secondary 168, pupils 50,140, teachers 3,550; technical and commercial 63, pupils 17,623, teachers 1,738; teachers' training colleges 28; students 4,338, lecturers 530; universities 4, students 17,029, professors and lecturers 1,787.

Agriculture. Main crops ('000 metric tons, 1950; 1951 in brackets): wheat 384 (400); barley 230 (263); oats 223 (330); rye 388 (415); maize 150; potatoes 2,548; sugar 67 (95). Livestock ('000 head, Dec. 1950): cattle 2,279; sheep 363; pigs (March 1951) 2,094; horses 283; goats 323; poultry 6,934.

Industry. Insured persons employed (Aug. 1951): 2,046,000. Fuel and power (1950; 1951, six months, in brackets): coal ('000 metric tons) 182 (97); lignite 4,308 (2,410); manufactured gas (million cu. m.) 356 (164); electricity (million kwh.) 4,908 (2,717); crude oil ('000 metric tons) 1,525 (900). Raw materials ('000 metric tons, 1950; 1951, six months, in brackets): iron ore 1,860 (1,124); pig iron 883 (478); steel, ingots and castings 943 (492); magnesite 545 (299); lead, smelter

9.2 (4.4). Manufactured goods: woven cotton fabrics 13.4 (6.8); cotton yarn 19.4 (10.7); wool yarn 11.0 (5.7); rayon staple fibre 31.1 (19.9); fertilizers 364 (206); chemical pulp and paper 489 (260).

Foreign Trade. (Million schillings, 1950, 1951, six months, in brackets): imports 7,092 (5,405); exports 6,516 (4,418). Main sources of imports (1950): U.S. 23%; Germany 17%; U.K. 8%; Italy 7%. Main destinations of exports: Germany 16%; Italy 13%; Czechoslovakia 6%; U.S. 6%. Main imports: coal, machinery and vehicles, and grain. Main exports: iron, steel and manufactures, textile manufactures and wood.

Transport and Communications. Roads (1947): 53,000 mi. Licensed motor vehicles (Dec. 1950): cars 45,000, commercial 48,000. Railways (March 1951) 3,761 mi.; passenger-mi. (1950) 2,670 million; goods, ton-mi. (1950) 3,311 million. Telephones (1950): subscribers 261,000. Wireless licences (1950): 1,200,000.

Finance and Banking. Budget (million schillings): (1950 actual) revenue 12,023, expenditure 12,234; (1951 est.) revenue 11,869, expenditure 12,570. Internal debt (Dec. 1948; Dec. 1949 in brackets): 11,152 (11,826). Currency circulation (July 1950; July 1951 in brackets): 5,857 (6,796). Bank deposits (June 1950; June 1951 in brackets): 5,330 (8,197). Monetary unit: *schilling* with an exchange rate (Nov. 1951) of Sch. 60.20 to the pound and Sch. 21.49 to the U.S. dollar.

AVIATION, CIVIL. Traffic on most air lines was good in 1951 but was accompanied by higher operating costs. Few operating companies made a profit, yet most reported smaller losses and some were evidently approaching a period of prosperity. On a number of routes, fares were increased to meet higher costs and plans were in hand to develop tourist or third-class travel by fitting aircraft with more seats. This plan had already been adopted by Air France on routes between France and French North Africa, as distinct from the method of reducing fares at "off" seasons and in "off-peak" hours. As Air France, alone among the chief European operators, made a profit in 1950, third-class air travel seemed worthy of careful examination. Early in 1951 U.S. operators, at regional meetings of the International Air Transport association, urged the provision of tourist travel on the North Atlantic services. A tentative agreement was reached to introduce it on these routes in Oct. 1952. But in the summer general meeting of I.A.T.A. the Americans pressed for an earlier start to include the 1952 holiday season, and meetings at the end of the year were considering this demand.

In preparation for tourist traffic Scandinavian Air services was arranging to fit at need into its Atlantic D.C.6s 80 seats instead of the normal 69. British Overseas Airways, reluctant to embark on this project until its Comets were in service, was nevertheless contemplating an optional increase in Constellation seats from 43 to 68. Royal Dutch Airlines (K.L.M.), in ordering new Constellations, arranged to have the seats set on rails so that they could be differently spaced for first, second and third class services. Schedules of tourist fares had not been announced at the end of the year, but certain U.S. operators forecast a saving of more than 30% on the return fare between New York and London or Paris. The expectation was of an average saving of 20% to 25%. Some experience of this type of traffic had already been gained by private charter companies and tourist agencies in transporting holiday parties and groups of emigrants. Given full loads, it had yielded remarkably low fares. The need was to endeavour to obtain full, or nearly full loads as against the usual computation of fares on a basis of filling 65% of available capacity.

This development, at a time of rising fares, emerged not only from the success of Air France but also from the marked success on shorter routes of special fares at "off-peak" hours. In British European Airways in the year to March 30, 1951, "off-peak" rates led to an improvement of 20% in overall aircraft utilization, and of 29% in those aircraft used on the popular routes. Meanwhile ordinary fares on several of B.E.A.'s services were raised by about 12%. This applied to the less profitable of the home routes as well as to some overseas services. Smaller proportional increases were made

by B.O.A.C.; e.g., the London-Sydney fare was raised from £260 to £280 with corresponding increases for intermediate sections. There was also an increase of £14 on the fare between London and Johannesburg, but on the section between Nairobi and London substantial concessions were offered to families at a time when a charter company was applying unsuccessfully for permission to run charter flights to London from east Africa. The threat of competition had to be met in one way and another by the big operators throughout the year. South African Airways sought to have K.L.M.'s services between Amsterdam and Johannesburg reduced from two to one a week, but failed. On the London-New York run, British, French and U.S. operators vied with one another in offering luxurious travel. In the holiday season B.O.A.C. ran one service a day non-stop between London and New York. K.L.M.'s contribution to the summer attractions on the Atlantic route was an all-sleeper service with 30 berths instead of the customary 43 seats in its Constellations.

In these efforts was reflected the desire to continue the improvement shown in the previous year's accounts. B.O.A.C. in 1950-51 had reduced its deficit by £3,250,000 but was still left with a loss of £4,500,000. B.E.A.'s loss was reduced by 28% and stood at £979,267. K.L.M.'s deficit of £3,500,000 in 1949-50 was brought down to about £1 million. Sabena, which had lost £636,800 the previous year, was reported as breaking even. Swissair, with more traffic, still suffered a loss largely through the effects of devaluation. Scandinavian Air Services too had a deficit. The only profit was earned by Air France and that amounted to £10,500. There were profits for some of the smaller companies. Aer Lingus showed a profit of £14,646; Cyprus Air Lines made £17,478 and Iberia, the Spanish company, made £258,212. All the evidence pointed to the willingness of the public to make increasing use of the air services and to the difficulty on the part of the operators in preventing increased revenue from being defeated by increased costs. K.L.M. with 16,000 more passengers, 3,700 tons more of freight and revenue up by 44% still lost money. B.O.A.C., flying 26% more passenger-miles, having revenue increased by £4,750,000 and staff reduced by 1,340 in the year, still showed a large deficit, though with still further improved traffic in the first half of the year 1951-52 it made a profit of £113,000. B.E.A.'s traffic in 1950-51 was so much improved that revenue advanced by 30%, but operating expenditure increased by 20.9%. B.E.A. also showed a profit of £243,000 in the first half of the year 1951-52.

Attention was directed more towards attracting traffic and making economies than to expansion. B.O.A.C. cut some of its losses by discontinuing its service along the west coast of South America to Lima. B.E.A. expected to save £20,000 a year on motor transport by moving from Gatow to Tempelhof airport in Berlin. Air France suspended its service to Brisbane via Noumea during the winter of 1950 but resumed it in Feb. 1951.

Some small expansions took place. S.A.S. extended its

The airship "Bournemouth" which flew for the first time on July 19, 1951. This was the first airship to be built in Britain for over 20 years. On its second flight, on Aug. 17, it was damaged as it was about to land when one of its guy ropes caught the railing on a workshop roof.

South American service from Buenos Aires to Santiago de Chile and its far eastern service from Bangkok to Tokyo. B.O.A.C. opened a service from New York to Nassau, Bahamas, and included a call at Zürich in its far eastern service. B.E.A. opened a London-Milan service and started a helicopter service between London and Birmingham. Air France linked its Paris-London service with Scotland by engaging a British charter company to operate the section London-Glasgow. El Al, the Israeli company, added services from Lydda to London and Lydda to Johannesburg. Aquila Airways, the one British company continuing to use flying-boats, ran summer services from Newcastle to Jersey, Southampton to Jersey and Newcastle to the Isle of Man while continuing its service to Lisbon and Madeira. The motor-car ferry from Folkestone to Le Touquet completed its third year with such success that Silver City Airways was given a 10-yr. licence and plans were made to start service between Southampton and Cherbourg in 1952.

In preparing for the future, few operators were ready to embark straight away on the use of jet or turbo-prop aircraft. B.O.A.C. remained fully committed to the use of the Comet jet liner from 1952 on main routes where stage lengths up to about 1,500 mi. were normal and it looked for the first deliveries of the turbo-prop Bristol 175 liners about a year later. It had also ordered some of the later Comets which, with Rolls-Royce Avon engines, were estimated as suitable for 2,000 mi. stages while carrying the same pay load of 14,000 lb. The first of these was expected during 1953. Orders for this mark of Comet were placed by Panair do Brasil. Two of the earlier Comets were still on order for Canadian Pacific Airlines. Intended originally for the Arctic route between Vancouver and Tokyo, these were now

said to be planned for use on those stages of the company's route to Australia which lie south of Honolulu. Air France, too, showed much interest in the Comet; it raised its order for Viscount turbo-prop liners from 5 to 12. Qantas Empire Airways was attracted by the long-range Comet, having particularly in mind the new route it hoped to develop between Western Australia and South Africa by way of the Cocos islands and Mauritius. B.E.A. began acquiring experience with turbo-props by fitting two of its freighter Dakotas with Dart engines similar to those used in the Viscount, 22 of which it had on order. First impressions of this turbo-prop in heavy service were extremely good.

Beyond this, active interest in the gas turbine for commercial purposes did not go in 1951, although anxiety among some U.S. operators lest they should find jet competition hard to meet was evident. In Europe the general tendency was to stick to established types. K.L.M. boldly declared its lack of faith by ordering five of the new Constellation 1049Cs and taking an option on four more. Sabena added two more Convair liners to its fleet, making a total of eight. Most of the other principal companies continued to rely on Constellations, D.C.4s and D.C.6s. This disinclination to abandon the piston engine rested wholly on fears of the gas turbine's high fuel consumption, particularly at low levels. Operators foresaw serious difficulties, especially in European winter weather, if gas turbine aircraft were kept waiting to land, and were not persuaded that traffic patterns at the approaches to busy airports could be sufficiently adjusted to diminish delays. British authorities, after nearly two years of flight by the Comet along the principal European routes, acknowledged the need for careful organization but did not share the general scepticism concerning the

prospect of an early solution. B.O.A.C., after a full eight months of route survey flying with the Comet on the runs to Johannesburg and Singapore, was equally hopeful of control modifications sufficient to meet the Comet's high speed and critical endurance limitations at airport approaches.

This aspect was submitted by the British authorities to a conference of Commonwealth representatives in the autumn. Emphasis at that conference was placed on better communications between airport and airport, better weather reporting particularly in relation to winds at great heights and better radio or radar aids for aircraft approaching to land. An example of the importance of these aids was found in the provision of distance-measuring equipment at London and Rome to allow the pilot of a fast liner to check his distance from the airport during the last 200 miles of approach. A similar beacon was due to be installed at Cairo. In the face of all doubts and disbelief B.O.A.C. was preparing with great satisfaction and high hopes to put Comets on the run to Cairo early in 1952, and to extend their service subsequently, first southwards through Africa to Johannesburg and later eastwards through Pakistan and India to Singapore and ultimately to Australia. It had plans also for starting, late in 1952, a Comet service between New York and Bermuda and afterwards between New York and Nassau. Confidence in these prospects led the corporation to begin trimming its fleet. It sold 23 Yorks and 4 Hermes IVs and declared a fifth surplus to requirements. It finally declined the three 140-ton Princess flying-boats which were being built for it, and these were promised to the R.A.F. for troop-carrying. Meanwhile, B.E.A., which had expected to have the use of its Ambassador aircraft to help with the heavy summer traffic, was still without them at the end of the year, mainly because of modifications to reduce the drag of the engine cooling system and to improve radio reception. There was

The Bristol 173, Britain's first twin-engined helicopter, which was designed to carry 12-14 passengers. The helicopter flew for the first time on Jan. 3, 1952.

some delay, too, in the conversion of 26 Dakotas into Pionairs with four extra passenger seats and a crew of two instead of three. Nevertheless the corporation contrived to carry a million passengers in the year and to become the first operating company outside the United States to do so.

All lines working between Europe and the far east in the second half of the year were at some disadvantage through the cessation of fuel supplies from Abadan. The effect was to restrict the fuel available at places east of Persia. B.O.A.C. cancelled for a time its freight services between London and Singapore. No passenger service was abandoned but charter flights to the far east became impossible. In consequence the movement of goods by air to the far east was subject to delays; congestion was increased by the heavy loads of Christmas traffic and mails and delay at one time amounted to more than a month. In November, B.O.A.C. restored one of its freight services to Singapore.

British helicopter services were continued throughout the year. The original passenger service between Liverpool and Cardiff was discontinued and a new one, over 95 mi., between London and Birmingham was started. B.E.A. expected by 1953 to take delivery of a two-engine helicopter with seats for 14 and to develop in succeeding years services between city centres in preparation for greatly expanded home services with 40-seater aircraft in 1963. (E. C. SD.)

United States. Air transportation in the United States showed a spectacular growth in every respect during 1951. Revenue passengers increased from about 19 million to more than 24 million, a gain of 28%.

TABLE III. U.S. COMMERCIAL AIR TRANSPORT INDUSTRY*

Traffic	1950 (actual)	1951 (est.)	Increase
Revenue passengers	19,083,517	24,416,000	28%
Revenue passenger mi. ('000)	10,929,799	14,133,000	30%
Mail ton mi.	68,066,580	85,906,000	26%
Freight ton mi.	318,870,093	389,386,000	22%
Revenue			
Passenger revenues	\$629,477,421	\$801,580,000	27%
Mail revenues, U.S.	118,400,622	114,474,000	3%†
Freight revenues	74,335,946	91,311,000	23%
Total operating revenues	858,596,708	1,043,325,000	21%

* The figures cover operations of 16 domestic trunk airlines, 10 international lines under the U.S. flag, 15 domestic local service air carriers, 4 certificated cargo air lines and more than 50 irregular service operators. † decrease.

Passenger traffic on commercial air carriers had by 1951 forged well ahead of Pullman traffic, which totalled 9,340 million passenger railroad-miles in 1950 and was not expected to exceed 11,000 million in 1951. With the introduction in 1952 of lower air-coach fares on a far wider scale than ever before attempted, this dominance of air passenger travel was expected to increase during 1952.

After years of pioneering effort, primarily by the U.S. irregular domestic operators, the idea of a second class or coach service at less than first-class rates finally caught on. Instead of about six cents a mile, transcontinental fares on the coach services were expected to average about four cents a mile. Coast-to-coast flights would cost \$99 or less. Coach fares between New York City and Miami would drop to three cents and a half a mile to match those between Los Angeles and San Francisco. Meanwhile, first-class rates on railroads in the U.S. averaged four cents and a fourth a mile or higher.

It was estimated that, with transatlantic air coach (tourist) services starting on May 1, 1952, total transatlantic air travel would increase from 339,000 passengers in fiscal year 1951 to more than 500,000 by 1953. U.S. flag carriers had faced increasingly stiff competition on the heavily travelled Atlantic routes in the previous few years. Immediately after World War II, before Europe had rebuilt its civil air fleet, U.S. operators had the field largely to themselves and carried about 95% of the traffic. By the fiscal year 1951, United States flag lines traffic accounted for only about 60% of the passengers arriving from Europe.

In anticipation of the rush for coach business, United States carriers had at the close of 1951 a substantial amount

of new equipment on order for early delivery. Although about 95% of the U.S. aircraft manufacturing industry's efforts during 1951 was devoted to military production, the demand for modern air transports increased unfilled orders at the end of the year to more than 500 units.

The French Nord 2501, a civil or military transport plane, powered by two Bristol Hercules engines.

Lockheed Aircraft Corporation, for example, reported 75 orders for its new L-1049 Super Constellation, which was certificated late in 1951 and had space for up to 93 first-class passengers or 110 coach fares. Late in Dec. 1951, Douglas Aircraft Company announced that American Airlines had contracted for 25 DC-7 aeroplanes, a new version of the Douglas DC-6B, powered with four Wright turbo compound engines rated at 3,250 h.p. each and cruising at 363 m.p.h. with 60 passengers in standard seating, or 95 in coach service.

After lengthy hearings before the Committee on Interstate and Foreign Commerce of the U.S. Senate, the Civil Aeronautics board established an administrative separation of service-mail pay from subsidy-mail pay. For the fiscal year 1951 the board estimated that a subsidy of \$34,565,000 had been included in the total domestic mail pay of \$61,934,000 for that period. It was the board's belief that by 1953 the subsidy would decline to about 30% of the total mail pay for that year.

On Dec. 17, 1951, Robert A. Lovett, secretary of defence, and Charles Sawyer, secretary of commerce, jointly announced the establishment of a civil reserve air fleet consisting of several hundred four-engined aircraft with crews normally engaged in commercial air transport service.

The fatality rate in 1950 for every 100 million passenger miles of domestic and international flying by the scheduled air carriers was 1.3, the same as the estimated rate for 1951. In domestic operations the estimated fatality rate was 1.4, compared with 1.1 in 1950. In international operations the rate decreased from 2.1 in 1950 to an estimated 1.2 in 1951.

An estimated 2,700 civil aircraft were manufactured in 1951 as compared with 3,520 in 1950. Discussion was carried on with aircraft manufacturers concerning certain turbine-type engines which they were considering for use in civil transport aircraft. One civil transport aircraft was equipped with a turbine-propeller power plant and was flying on an experimental basis. Twenty-four new engine models ranging in power from 90 h.p. to 3,500 h.p. were approved. Major type certification projects during the year included the Douglas DC-6A and DC-6B models.

Work on the agricultural aeroplane, AG-1, which was completed and successfully test-flown in Dec. 1950, continued. The aeroplane was demonstrated over much of the United States. The federal government adopted a policy of intensified support of commercial transport helicopter development, as the result of a study and report made by President Harry S. Truman's air co-ordinating committee during the year. It was found that the military development and use of transport

helicopters had advanced to the point where effective utilization of large multi-engined rotary wing aircraft on short-haul air line routes could be foreseen. The report called upon the post office department to continue the use of helicopters in terminal handling of mail in the Los Angeles and Chicago areas. (See also AIRCRAFT MANUFACTURE; JET PROPULSION AND GAS TURBINES.) (J. P. V. Z.; B. M. ST.)

AZORES: see PORTUGAL.

BACON: see MEAT.

BACTERIOLOGY. Recent events had promised new weapons and a new methodology in medical microbiology. One new agent isolated, Protaptin, was an antibiotic produced by a bacterium trained specifically for the task of destroying the bacillus of tuberculosis. The antibiotic was obtained by cultivating a bacterium of the genus *Proteus* in a meat broth containing dead tubercle bacilli. By the gradual elimination of the meat, the bacterium became adapted to a diet exclusively of tuberculosis organisms and produced a substance capable of destroying virulent tubercle bacilli, yet which was harmless to experimental animals. Years elapsed before the pure antibiotic was successfully isolated, and by the end of 1951 it was believed that the ultimate value of this drug might soon be demonstrated when its performance in clinical trials was evaluated. Perhaps more important, however, was the illustration of a new method which, it was thought, would greatly increase the scope of microbiology, namely, the growth of "killer" microbes adapted for the role of antagonist to a specific pathogen.

The ability of penicillin to penetrate scar tissue and to exterminate the organisms protected by it was increased by the addition of iodine to the antibiotic. This product was reported to have penetrated scar tissue in the lung in cases involving lung abscess, chronic bronchitis and other chronic lung conditions where penicillin had normally been ineffective.

Botulism from Wounds. Botulism, most deadly of the food-borne intoxications, was reported to have occurred as the result of wounds. Two patients, one a 13-yr.-old boy with a minor gunshot wound, the other a victim of a handsaw cut, died with symptoms of botulism. These deaths reopened the question of the pathogenicity of *Clostridium botulinum*, which had long been thought to be capable of intoxication only *per os*.

Coxsackie Virus. In 1947 a virus isolated during a polio epidemic at Coxsackie, New York, was found to be the aetiological agent for a disease symptomatically similar to but milder than poliomyelitis. The agent, named the Coxsackie virus, was thought to be the vector of a disease which occurred in Europe about 1870 and was called epidemic muscular rheumatism. Sporadic outbreaks of epidemics having much in common with the Coxsackie epidemic had been reported in medical literature but speculation on this virus increased with the Fannin county (Texas) epidemic which produced more than 8,000 cases. Whether the virus there was the same as the Coxsackie virus originally isolated in 1947 was conjectural; another even more startling development was the fact that the disease resembled poliomyelitis and that only one case of true poliomyelitis was reported from Fannin county, a far lower incidence than usual for that area. Research on both these facets of the disease was continuing in 1951.

Positive proof of the identity of the Coxsackie virus was offered by scientists who investigated an outbreak of 50 cases in Hoquiam, Washington state, and isolated group B Coxsackie virus from stool specimens of patients. Increased

frequency of identification of viruses helped to reveal a rapidly growing incidence of Coxsackie virus epidemics.

Poliomyelitis. There was much evidence that certain predisposing factors might increase the incidence of certain types of poliomyelitis or the severity of poliomyelitis attacks. Evidence of an increased incidence of bulbar poliomyelitis following tonsillectomy had been presented and refuted on numerous occasions; the consensus now was that tonsillectomies during the epidemic poliomyelitis season should be avoided.

Observations were made in Australia, England and Wales that inoculation of children with pertussis vaccine, diphtheria toxoid or penicillin was followed by a greater occurrence of paralytic poliomyelitis than was warranted by usual incidence rates, and that the paralysis was associated with the site of injection to an inordinately high degree. A causal relationship was presumed and data to establish facts collected. Animal experimentation in mice injected intraperitoneally with pertussis vaccine alone or with diphtheria toxoid showed a significant decrease in the incubation period before the onset of paralysis as compared with controls. The *Journal of the American Medical Association* discussed the clinical reports but withheld judgment until more data had been received, and advised clinicians to postpone immunization with pertussis vaccine and diphtheria toxoid until poliomyelitis outbreaks had subsided.

Basic research on poliomyelitis continued to offer more clues to the cryptic source of poliomyelitis and the often attendant paralysis. An investigation indicated that the cockroach, *Periplaneta americana*, excreted infective amounts of Coxsackie virus for a 15-day period and that faeces from the insects fed poliomyelitis virus resulting in the death of monkeys to which they were transferred.

Bacteria in Oil Production. Bacterial inoculation of exhausted oil wells was reported to increase the flow of petroleum. From the cores of Louisiana oil wells, in Pacific ocean mud taken from a depth of 6,000 ft. and from the waters of the Chicago Drainage canal a micro-organism was isolated which has the power to extract oil from rock. *Desulfovibrio hydrocarbonoclasticus* is capable of breaking down heavy hydrocarbons into lighter ones, producing acids which dissolve rock in oil-bearing strata and generating carbon dioxide gas which increases the flow of oil by exerting pressure. Research in progress during 1951 was designed to find out how to make petroleum by microbial action.

Bacteria and Atomic Energy. Milk and meat irradiated for 20-40 hr. by X-rays and gamma rays from radio-active cobalt 60 were observed to remain unchanged after three weeks of storage in plastic bags at room temperature. Bacteriological analysis of the milk revealed it to be sterile. No trace of radioactivity remained in these foodstuffs. The possibility of food preservation as a by-product of the atomic pile thus presented itself, subject to further experimentation and analysis. (M. N.)

BADMINTON. The second contest for the Thomas cup, officially styled the International Badminton championship, was begun in 1951. Eleven nations challenged Malaya, the holders. India won the Pacific zone championship after victories over Thailand and Australia. European and U.S. zone play was not due to be completed until 1952.

The All-England championships were held in London in March. Wong Peng Soon (Malaya) and Frk. Aase Jacobsen (Denmark) won the singles titles, and E. L. and E. B. Choong (Malaya), Fru Tonny Ahm and Frk. Kirsten Thorndahl (Denmark) and Paul Holm and Fru Ahm (Denmark) the doubles events.

A Danish team toured South Africa and both Rhodesian and Indian teams visited Australia, and several top grade

Malayan players came to Europe. In addition, a number of U.S. and Canadian players visited Glasgow in November for an international invitation tournament of champions.

Apart from the Thomas cup contest, many international matches took place. England defeated Ireland and Scotland, but lost to Denmark and Sweden; Ireland again beat Scotland, and Denmark overcame South Africa four times.

County or provincial competitions were played in most English-speaking countries, the winners being Middlesex (England), Victoria (Australia), Transvaal (South Africa), Bombay (India), Otago (New Zealand) and Penang (Malaya).

Organizations in 21 countries were affiliated to the International Badminton federation in 1951, of which Sir George Thomas remained president. (H. A. E. S.)

BAHAMA ISLANDS. British colony, an archipelago of 21 inhabited and about 680 uninhabited islands off the coast of Florida. Area: 4,403 sq.mi. Pop.: (1943 census) 68,846; (1949 est.) 78,275. Language: English. Religion: Christian. Capital: Nassau, on New Providence island. Administration: governor; executive council; legislative council, 9 unofficial nominated members; house of assembly, 29 elected members. Governor, Major General R. A. R. Neville.

History. Butlin's vacation village at West End, Grand Bahamas, remained closed throughout 1951. No decision was reached as to its future, but negotiations with a group of American financiers continued. Doubts were expressed as to the agricultural prospects of the Colonial Development corporation's large-scale project started in 1950. However, as a result of successful negotiations in 1950 some 4,000 agricultural workers were employed in the United States, and thanks to this and the building boom there was practically no unemployment on New Providence.

In an attempt to broaden the basis of the economy an Industries Encouragement act was passed offering substantial attractions to companies established under it: any such company was permitted to bring in plant and equipment free of duty; neither plant nor industry would be subject to taxation other than the existing real property tax for the first ten years; all duty paid on raw materials would be refunded on the exportation of the finished product; and there would be complete freedom to bring key workers. Several applications for registration under the act were quickly received.

Construction of guided missile stations in the Bahamas long range proving ground proceeded satisfactorily.

Education. Schools (1950): government and aided 124 (attendance 13,356), denominational 46 (3,591), private 7 (334). Higher education was provided at five schools in Nassau and there was a technical school and a teachers' training college at Oakes Field.

Finance and Trade. Currency: pound sterling; United States dollars also generally accepted. Budget (1950 actual): revenue £1,579,748; expenditure £1,658,741. Foreign trade (1950): imports £6,150,200; exports £904,671. Principal exports: lumber, tomatoes and crawfish. The tourist trade remained the basis of the economy: tourists (1950-51 winter season) 37,500 (18,800 in 1948-49 and 20,800 in 1949-50). Although the colony had been primarily a winter resort, it had successful summer seasons in 1950 and 1951. (J. A. HU.)

BALANCE OF PAYMENTS. The year 1950 was characterized by a closer approach to equilibrium in international payments. Although the dollar value of world trade remained broadly unchanged, the surpluses and deficits in current accounts were greatly reduced. One of the most important factors was the reduction in exports and increase in imports of the United States. The outbreak of the Korean war in 1950 had led to a rise of prices and to a sharp deterioration

in the terms of trade of all the industrial countries. Thus while the foreign trade of Europe and that of the United States expanded in 1951, severe balance of payments difficulties were recreated in many European countries. A first sign of this change was a return to a high export surplus of goods and services in the United States in the second and third quarters of 1951, a considerable shift from the pattern from the end of 1949 to March 1951. The most important part of the increase was due to larger purchases by Europe and there was also an increase in the purchases of Latin America because of an improved foreign exchange position there.

In the first half of 1951 the overseas sterling area still earned a surplus in its transaction with the United States, many of the countries benefiting from increased raw material prices, but in the second half of the year the position of both the overseas sterling area and of the sterling area as a whole—that is, including the United Kingdom—deteriorated. Purchases in the United States increased; there was a decline in U.S. purchases of wool, rubber and tin, and increased dollar payments against sterling to third countries, with the disappearance of U.S. government aid to the United Kingdom, suggested that in the second half of 1951 the sterling area might even be found to have had a deficit with the United States. This trend was reflected in the heavy loss of gold and dollars by the sterling area in the second half of 1951; losses in the third and fourth quarters were \$638 million and \$940 million as compared with gains of \$360 million and \$54 million in the first two quarters. In October alone they amounted to a further \$320 million and at Dec. 31 the reserves of the sterling area were \$2,335 million as against \$3,300 million at the end of 1950. The chronic deficit of the United Kingdom became aggravated by a deficit of the overseas sterling area countries which earlier in the year still earned a surplus; consequently the whole sterling area was at the end of the year in deficit all round the world.

United Kingdom Current Account. The United Kingdom's deficit with the dollar area was not, towards the end of the year, counterbalanced by a surplus with the rest of the world as had been the case in, for example, 1949. This deficit was coupled with a serious deterioration of the balance with the world at large; it was estimated that the deficit with all countries for the year were of the order of £500 million. The deterioration in the current balance occurred almost entirely in the visible balance. The excess of imports (valued c.i.f.) over exports (valued f.o.b.) for the year was £1,208 million as against £352 million in 1950. This was due partly

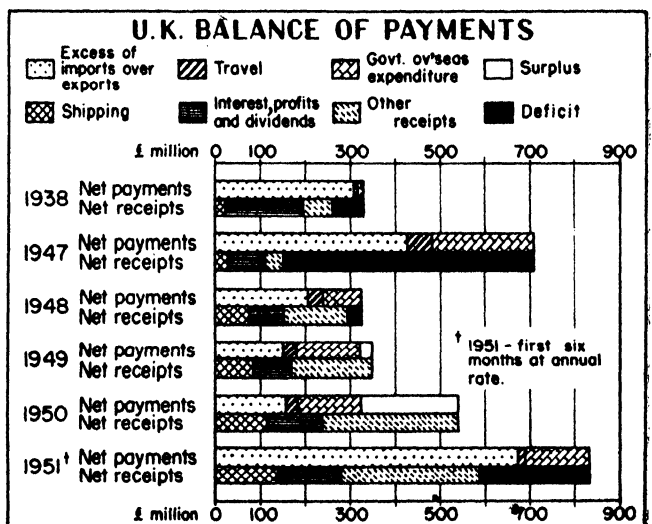

to a 13% deterioration in the terms of trade and partly to a 15% increase in the volume of imports with only a 3% increase in the volume of exports.

Invisible items showed no improvement comparable to that experienced during 1950. Indeed a deterioration was expected to have taken place in the second half of 1951, because of the loss of the Persian oil, the replacement of which was estimated to cost \$300 million.

United Kingdom Balances: Distribution by Areas. The striking fact is that in the first half of 1951 the United Kingdom was in deficit both with the dollar area and with the Organization for European Economic Co-operation area as well as with the rest of the world; it was also in deficit with the sterling area on visible trade but earned a much reduced surplus when visible and invisible trade were considered together. The deficit with the dollar area increased to £109 million in the first half of 1951 as compared with a deficit of £56 million and £51 million in the first and second halves of 1950 respectively.

In relation with the rest of the sterling area the United Kingdom showed a surplus of £46 million in the first half of 1951. In the same period the overseas sterling area earned a substantial surplus in its dealings with the dollar area and contributed this surplus, amounting to £148 million, to the common pool. The overseas sterling area also continued to sell gold to the United Kingdom, amounting to £41 million in the first half of 1951. It also earned £121 million from third countries. The sum of these three items was well in excess of the U.K. surplus; they were increased by net borrowing of sterling area countries from the United Kingdom, leading to an increase of £368 million in the sterling balances of the overseas sterling area in the first half of the year, bringing these balances to £600 million higher than at the end of World War II. The sterling balances held outside the overseas sterling area also increased by about £57 million in the first half of 1951 and the total sterling liabilities to all countries stood at £4,168 million at the end of June 1951, as against £3,743 million at the end of 1950.

In the first half of 1951 the United Kingdom had a deficit of £26 million with the O.E.E.C. area as compared with a surplus of £53 million and £69 million in the first and second halves of 1950. Between the first half of 1950 and 1951 the United Kingdom imported from the O.E.E.C. area over 50% more by value but sold only about 20% more British goods to western Europe. As the overseas sterling area also made heavy purchases in the European countries, the United Kingdom position in the European Payments union changed from that of a creditor to that of a debtor, a process which

was even more aggravated in the second half of the year; the United Kingdom was then losing gold in part-payment of its debt to the union—it paid \$204 million in gold to the union in the second half of 1951. This development was the main reason for the substantial cuts in private purchases of foodstuffs and other goods from O.E.E.C. countries announced in November.

European Payments Union. The union had been badly shaken by the wide swings in the balance of payments of member countries which began after the Korean war. As an example of the forces operating, the unequal progress in the rearmament drive in the various member countries appeared in 1951 to have diverted orders from the United Kingdom and France to Belgium, Italy and Western Germany. Consequently the position of the latter countries within the union was strengthened; indeed Belgium was asked to keep its surplus under stricter control and agreed to a reduction in gold payments on its surplus. The United Kingdom and France were at the end of the year virtually the only debtors of the union. The initial reserve of the

* Provisional.

union declined from \$350 million to \$210 million.

The liberalization of European trade and the European Payments union were the only truly effective measures taken towards a freer movement of goods and services. At the same time, however, customs conferences were being held on a wider basis, representing countries, including the United States, responsible for four-fifths of the world trade. These conferences, the sixth of which was opened in Geneva in Sept. 1951 were organized within the framework of the General Agreement on Tariffs and Trade (G.A.T.T.) and had led to an immense number (about 60,000) of small tariff concessions. The time had not come by 1951 for a more general reduction of tariffs or for freer convertibility of currencies.

Future Prospects. The immediate outlook of the balance of payments position of the world after the end of 1951 was expected to be influenced in the first instance by some reversion in price trends and a consequent improvement in the terms of trade of the industrial countries. However, as the rearmament drive gathered speed, the pressure on resources would increase. Thus, unless output increased or inflationary forces were otherwise controlled, imports would tend to increase and exports to decline, thereby aggravating the balance of payments position of such countries as the United Kingdom, France and others in western Europe. The dollar shortage of western Europe, including that of the United Kingdom, was expected to continue. Western Europe could not hope to expand substantially its exports to the dollar area, while still needing supplies from that area. Also the forces of speculation were expected to work against certain European currencies. The manner in which the expected dollar deficits of western Europe would be financed was uncertain. In the United States fiscal year of 1951-52 there was at the disposal of the administration \$8,000 million for foreign aid, of which about \$6,000 million was available for aid to European countries. Slightly more than \$1,000 million was authorized for economic aid and there was a further possibility of transferring up to \$500 million from military to economic aid and of spending perhaps another \$300 million in the form of armament orders in Europe. In distributing these funds the emphasis was no longer on European recovery, which was regarded as having been completed, but on mutual aid for common defence.

(L. Rs.)

BALFOUR, SIR JOHN, British diplomat (b. London, May 26, 1894), was educated at Eton college and at New college, Oxford. He entered the Foreign service in 1919 and served in Budapest, Sofia and Belgrade. He was minister in Lisbon (1941-43), Moscow (1943-45), and Washington (1945-48) and ambassador to the Argentine republic from 1948 to 1951. In March 1951 he went to Madrid as the first British ambassador to Spain since 1946, when envoys were recalled in compliance with the United Nations recommendation. He was created a K.C.M.G. in 1947.

BANK FOR INTERNATIONAL SETTLEMENTS. The bank's business continued to expand at a rapid pace in the year covered by the report to March 31, 1951, the increase in the balance sheet total of Swiss (gold) Fr. 270.7 million to 1,025.5 million being even greater than that recorded in the previous year. The movement slowed down in the later months of 1951, however, the net rise in the six months to Sept. 30 being limited to Swiss (gold) Fr. 30.1 million. The higher figures were the result of the increased use of the bank by European central banks—its principal customers—for short-term credit and deposit operations and for transactions in gold and foreign exchange. No decisions having been taken during the year to resolve the German debt problem, the section of the balance sheet relating to the execution of the Hague agreement of 1930 on German World War I reparations showed no change.

BANK FOR INTERNATIONAL SETTLEMENTS			
(Million Swiss gold francs, pre-1936 value)			
		March 31, 1951	March 31, 1950

Deposits of creditors and other liabilities		297.2	297.2

The development of the banking side of its business coupled with its work as agent for the European Payments union brought about a further substantial expansion in the turnover of the bank. Net profit in the year to March 31, 1951, at Swiss (gold) Fr. 6.1 million was, however, only slightly higher than in the preceding year. The bulk of it was placed to reserve but a portion was utilized for resuming the dividend service at a rate of 12.53 Swiss (gold) francs per share.

In the review of the world economic situation included in its annual report, the bank urged the commercial countries to abolish exchange restrictions, to relax import restrictions, to adopt restrictive credit policies and abandon cheap money practices. It argued that controls used during World War II could not be successfully applied in time of peace, even if it was an armed peace. (C. H. G. T.)

BANKING. The dislocation of the world prices structure, stemming in the first place from the violent movements in the main commodity markets after the opening of the war in Korea, dominated the banking scene in Great Britain, the Commonwealth, Europe and the middle east throughout 1951. In countries primarily concerned with the production of commodities, inflationary processes set in motion by the steep rise in the prices of raw materials in the second half of 1950 developed rapidly in the early months of 1951, bringing in their wake a spectacular expansion in the volume of bank money. In countries mainly devoted to the production of finished goods, the inflationary movement, making itself felt in the first instance through increases in the prices of imports, took longer to develop its full proportions. In these

countries the distortion of the banking structure was of a fairly moderate order in the first part of the year but became more serious later.

In almost all countries there was a tendency towards greater stability in the banking system in the last few months of the year. This was due in part to the interruption of the rise in world commodity prices after the change in United States stockpiling policy in March. It was also attributable to the intensification of governmental measures to contain inflationary pressures. This second development was of special importance to the banks because the tendency, first generally evident in 1950, for greater reliance to be placed on the traditional instruments of monetary control—bank rate and quantitative control of credit through central bank action—in the fight against inflation became more marked in 1951. In many countries the practice, followed under the "cheap money" technique, of allowing unrestricted creation of bank credit, provided such credit was ostensibly intended to satisfy demands for investment finance that were in accordance with the national interest, was substantially modified. Thus steps were taken to supplement these so-called "selective" credit controls by overall controls, operated mainly by limiting the quantity of liquid resources available to the banking system for sustaining credit structures. At the same time, wider use was made in many countries of the bank rate mechanism for influencing the trend of interest rates.

Great Britain. The impact on the banking structure of the rise in the prices of imported goods was cushioned during a large part of the year by the emergence of a substantial deficit in the country's external payments. The fact that imports were running far ahead of exports meant that the flow of sterling to the government, on account of payments by the public for goods brought in from abroad, greatly exceeded the amount of sterling the government was required to transfer to the public in respect of the conversion of the foreign exchange proceeds of exports. The surplus accruing to the government from this source enabled it to deal with the tendency for budget receipts to fall short of outgoings and still retain considerable sums for reducing its indebtedness to the banking system. The effect of this net flow of money from the public to the government was to apply a downward pressure on bank deposits and bring about a considerable net reduction in bank holdings of assets directly or indirectly concerned with lending to the government—call money, bills discounted and Treasury deposit receipts. Thus, despite a substantial amount of credit creation by the banks to meet the enlarged demand for loans from the public to cover the increased cost of carrying stocks after the rise in prices, it was possible for British banks to avoid any extensive net addition to the quantity of bank money of the kind seen in many other countries. At the end of October the net deposits (*i.e.*, published deposits after deduction of the duplicating item "balances in course of collection") of the London clearing banks, which together accounted for some 95% of all commercial bank resources in Great Britain, were actually slightly lower than a year before.

ELEVEN LONDON CLEARING BANKS
(£ million)

	Oct. 1949	Oct. 1950	Oct. 1951
Deposits	6,050	6,204	6,204
Net deposits	5,868	6,006	5,981
Cash	499	509	514
Call money	556	557	579
Bill holdings	1,162	1,414	1,340
Treasury deposit receipts	744	496	177
Investments	1,517	1,505	1,555
Advances	1,466	1,598	1,897
Acceptances, etc.	261	346	481

In reducing its indebtedness to the banking system, the main emphasis was placed by the government on the

repayment of Treasury deposit receipts. There was, however, a reversal during the year of the steady increase in the banks' holdings of Treasury bills in progress during the preceding years. And this tendency was accentuated just before the close of the year when the government converted a substantial portion of the Treasury bill issue into short-term bonds. This was an attempt to discourage bank lending by curtailing the supply of liquid assets available to the banking system.

In accordance with official wishes, the banks made a general increase in rates of interest for almost all forms of business during the year. In the middle of the year rates for commercial bill transactions on home and overseas account were raised together with charges for loans and overdrafts. After the change in official monetary policy in November, rates governing all short-term financing were substantially increased and it was indicated that loan and overdraft facilities would be more difficult to obtain and more expensive.

Commonwealth. The year proved just as troublesome for Australian bankers as its predecessors. There was less worry on account of domestic banking affairs, the previous controversy over the best form of control for the banking system being brought to an end by the passage through parliament of a government measure repealing the Bank Nationalization act of 1947 and restoring control of the Commonwealth bank to a board of ten members. But the banking system was subjected to tremendous stresses by the violent movements in the volume of money, caused by the sharp fluctuations in the prices of commodity exports and the swings in the country's external balance of payments. Through the early months of the year, bank deposits rose steeply, the total for the trading banks moving up to the record level of £A 1,300 million in April, as compared with £A 1,000 million a year before. This expansion was due in part to the creation of credit by the banking system to meet the enlarged demands for loans stimulated by the rise in export and other prices. It was also due to the considerable accumulation of money in the hands of Australians which resulted from the fact that spendings abroad were falling far short of receipts from overseas countries. Later in the year the relapse in the prices of important Australian commodities, assisted by a swing in the external payments from a position of surplus to deficit, exerted a downward pressure on the volume of money. At the end of August, the trading banks deposits at £A 1,200 million were only some £A 200 million higher on the year. At that time about half the additional deposits were represented on the assets side of bank balance-sheets by larger advances, the balance mainly by an increase in the banks' frozen balances with the Commonwealth bank. The official drive to counter inflation resulted in the banks' being required, in the second half of the year, further to tighten restrictions on lending. Two of the largest trading banks—the Union Bank of Australia and the Bank of Australasia—merged to become the second largest Australian bank and the largest New Zealand bank under the title Australia and New Zealand bank. External developments also led to a steep expansion in the volume of bank money in New Zealand in the early part of the year but steadier conditions were established later as a result of the relapse in the price of wool and the intensification of official anti-inflation controls.

In Canada, the government took steps early in the year to counter inflationary stresses generated by the rise in the world prices level. The banks were requested to restrict the total quantity of bank credit. They were also asked to allocate supplies of credit, within the limits set by quantitative restrictions, in accordance with a list of priorities drawn up by the government. At the end of September, the deposits of the chartered banks were slightly lower than a year earlier.

The total of advances to the public at \$2,900 million was some \$650 million higher but only \$50 million above the March figure.

In India, the increase in the money supply in the early part of 1951 was slower than in many other countries concerned mainly with primary production. But the government embarked upon a dearer money programme with an increase in bank rate shortly before the end of the year, because the expansion in bank loans was considered excessive. In Pakistan, the government continued its efforts to develop an efficient banking system. The rise in world prices caused some distortion of banking figures but it was relatively modest. In Ceylon, the newly established central bank presented its first report showing that, despite the gross distortion of the prices structure caused by the post-Korea boom in the country's principal exports, the new organization was functioning satisfactorily and enjoying the full co-operation of the commercial banks.

The expansion in the volume of bank money in the Union of South Africa was reversed in the second half of 1951. This was partly due to the decline in the prices of important exports like wool and partly the result of the heavy drawings that had to be made on the cash reserves of business concerns to pay for the increased volume of imports after the relaxation of import restrictions. The same factors were responsible for the sharp contraction in the Reserve bank's holdings of gold and foreign exchange from March 1951 onwards.

Europe. Inflationary pressures and official efforts to contain them resulted in considerable stresses being imposed on banks in nearly all European countries. French bankers were among the worst sufferers, official measures to halt the wages-prices spiral being largely ineffective for a great part of the year. By the autumn the increase in the volume of bank credit compared with a year before was about 25%. The movement moderated somewhat later, partly owing to the exodus of capital from the country stimulated by fears of devaluation of the franc and partly owing to the official decision to make more use of monetary controls, including increases in the bank rate, to contend with the economic crisis. In Belgium, indications that the restrictive credit measures imposed in 1950 were causing an unduly sharp contraction in business activity resulted in the bank rate being reduced in the first half of 1951. Later in the year, the banking system was required to make extensive changes in procedures for financing trade with other European countries in connection with the official drive to solve Belgium's European Payments union crisis. In Germany, the severe credit restrictions imposed towards the end of 1950 to deal with the external payments crisis were largely maintained through 1951, because the emergence of a surplus in external payments caused a further sharp expansion in the supply of bank money. The central bank law was changed to give the Federal government more effective control of monetary policy. Arrangements were also made for a re-organization of the commercial banking system. In Sweden, the government made an attempt to combine credit restriction with the continuance of the cheap money policy by developing plans to bring all interest rates within the control of the central bank.

Middle East. The measures establishing the National Bank of Egypt as the country's central bank became effective early in the year. In Israel, the external payments crisis persisted throughout 1951 and government measures to deal with this and the extensive capital development programme were the main concern of the banking system. In Persia the financial crisis which developed from the oil dispute with Great Britain produced considerable distortion of the banking structure.

(C. H. G. T.)

United States. The most important development during 1951 was the return to a more flexible monetary policy, freed from the limitation of supporting prices of government securities and keeping interest rates from rising. In March, the federal reserve system permitted long-term government bonds to sell below par, and in December substantial support was withdrawn from the short-term market. With the market free to reflect the balance between supply of and demand for funds, interest rates rose substantially. The prime commercial loan rate rose from $1\frac{1}{4}\%$ in January to $2\frac{1}{2}\%$ in May and to 3% by December. The yield on long-term government taxable bonds increased from $2\cdot39\%$ in January to $2\cdot74\%$ as the year closed, while the yield on Aaa corporate bonds rose from $2\cdot66\%$ to $3\cdot03\%$.

Another notable feature was the voluntary credit restraint programme. This was an effective and co-operative effort of the federal reserve system and all major groups of lending institutions to curtail the use of credit for speculative purposes, to divert funds from non-essential uses and to limit over-all credit expansion while at the same time assuring adequate funds for the defence effort.

On March 9 the board of governors of the federal reserve system addressed a request to all financing institutions in the United States to follow it. Under the leadership of the national voluntary credit restraint committee headed by federal reserve board governor Oliver S. Powell, numerous regional and group committees were established. Commercial banks, life insurance companies, property insurance companies, investment banking firms, savings and loan associations and mutual savings banks joined in the programme. Six bulletins were issued by the national committee, setting forth general principles to guide participants in meeting demands for inventory loans, business capital expenditure financing, state and local government borrowing, certain types of real estate credit, borrowing by foreigners and borrowing on unlisted securities.

New peaks were reached by the end of the year in total loans and investments of all commercial banks, at \$133,400 million; in total loans, \$58,300 million; in total commercial and industrial loans, about \$26,600 million; and in holdings of state and local government and other securities, \$13,200 million. Commercial bank holdings of government securities declined slightly during the year to \$61,900 million.

Total loans and investments of all commercial banks rose \$6,700 million during the year, somewhat more than in the preceding year. The expanding volume of defence production, changing consumer and business expectations as to inflation, and the impact of credit restraint and material shortages, however, altered the pattern of credit expansion in several ways. The increase in commercial and industrial loans at all commercial banks during 1951 was about \$4,700 million, almost the same as in the year before. Total loans of all commercial banks rose about \$6,000 million or 12% in 1951, as compared with a jump of \$9,200 million or 21% the year before.

On June 30, 1951, national banks, which numbered almost 5,000, held \$86,589 million of total deposits. State banks, which numbered about 9,200, had total deposits of \$64,900 million.

Little change was shown in the gold stock over the year as a whole. The decline in the gold stock which had been under way since the fall of 1949 was brought to an end in May. During the third quarter, net gold imports made their reappearance, reflecting a sharp increase in the surplus of exports.

The year saw the first yearly increase in money in circulation since the rapid wartime growth which ended in 1946. After an increase of \$1,400 million during the year, money in circulation stood at the record height of \$29,403 million on

Dec. 26. During 1951 as a whole the gross federal debt increased by about \$2,800 million to \$259,500 million on Dec. 31, 1951.

New state and municipal financing in 1951 was about \$3,200 million, less than the record of \$3,700 million set in 1950 but more than in any other year. In spite of material shortages and tax resistance by voters, at the end of the year an extremely large volume of state and local bonds was under consideration. (J. K. L.)

Mutual Savings Banks. Combined assets of the mutual savings banks of the United States were \$22,892,025,460 on July 1, 1951, a gain of \$598,936,265 or $2\cdot69\%$ for the year. Deposits were \$20,399,573,434, a gain of \$460,260,489 or $2\cdot31\%$ for the year. On July 1, 1950, assets of these banks were \$22,293,089,195, deposits \$19,939,312,945, the respective increases during the year ended on July 1, 1950, being \$1,180,947,148 or $5\cdot59\%$ and \$991,292,834 or $5\cdot23\%$. On July 1, 1951, the combined surplus of the banks was \$2,323,270,025 or $11\cdot39\%$ of deposits, as compared with \$2,209,947,477 or $11\cdot08\%$ of deposits for 1950. On July 1, 1951, there were 19,408,115 accounts. For the year ended July 1, 1951, dividends credited to mutual savings accounts averaged $2\cdot05\%$.

The major changes in asset distribution from July 1, 1950, to July 1, 1951, were similar to those of earlier years, that is, a decrease in amount and per cent of U.S. government securities and an increase in real estate mortgage loans, in large part insured by the Federal Housing administration and the Veterans administration under federal statutory provision. The combined assets of all mutual savings banks on July 1, 1951, were invested as follows: U.S. government securities $44\cdot65\%$, other securities $10\cdot92\%$, real estate mortgage loans $38\cdot94\%$, and other assets $5\cdot49\%$.

The federal income tax-exempt status of mutual savings banks was removed by congress during the year. Net income after expenses and dividends and after specified allowances for reserves was made subject to the corporation tax beginning with fiscal years after Jan. 1, 1952. (See also BANK FOR INTERNATIONAL SETTLEMENTS; BANK OF ENGLAND; BANK OF FRANCE; BUSINESS REVIEW; EXPORT-IMPORT BANK OF WASHINGTON; FEDERAL RESERVE SYSTEM; INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT; INTERNATIONAL MONETARY FUND.) (HE. BR.)

BANK OF ENGLAND. As central bank of the United Kingdom, the Bank of England took an active part in formulating and implementing the new monetary policy introduced in Nov. 1951 by the Conservative government. Aimed at making wider use of the traditional instruments of credit control to counter inflationary pressures, the first objective of the new policy was to restore flexibility to the short-term money market; the bank's rate for re-discounting bills (the bank rate) was raised from 2% to $2\frac{1}{2}\%$ but to minimize the effect on the cost of servicing the government's short-term debt, a special rate of 2% was fixed for loans against Treasury bills, a departure from the orthodox practice of charging $\frac{1}{2}\%$ above the bank rate for such accommodation. The supply of credit was restricted from November and the money market was forced in the last two months of the year to obtain assistance from the bank on bank rate terms for the first time in 13 years.

The emergence of a substantial deficit of receipts against expenditures on external account raised important policy issues and imposed increased stresses on the exchange control machinery the bank operated for the government. A number of European and Asian countries were brought within the scope of the sterling transferable account system, and in December exchange regulations were modified to permit the regrouping of the London foreign exchange

market. The rise in prices and wages caused by inflationary pressures in Britain resulted in an expansion in the public's basic currency requirements. To accommodate this the bank raised the total supply of notes by making a net increase of £50 million in the fiduciary issue in the year to Oct. 31. The bank's annual report covering the year to Feb. 28, 1951, contained surveys of currency trends and information concerning the use made of sterling transferability facilities.

(C. H. G. T.)

BANK OF FRANCE. The grave deterioration in the French economic situation, both internally and externally, made 1951 a harassing year for the Bank of France. Signs that the impressive improvement in the balance of payments and the internal financial situation which began in 1950 was coming to an end persuaded the bank early in the year to discontinue the practice of relaxing exchange and credit restrictions. But no attempt was made during this period to withdraw any of the concessions granted in the previous year. In the second half of 1951, however, it became evident that France was heading for another serious economic crisis and from August onwards the bank devoted its main attention to measures to counter the effects of growing inflationary pressures. During Oct.-Nov. 1951 the re-discount rate (bank rate) was twice raised to bring it from 2½% to 4%. Restrictions governing the provision of credit by private banks were intensified. Other measures included the suspension of forward dealings in foreign currencies and the curtailment of the amount of certain foreign currencies that private banks could hold abroad.

BANK OF FRANCE
Sept. 29, 1949 Sept. 28, 1950 Sept. 27, 1951
(Fr. million) (Fr. million) (Fr. million)

Assets	Sept. 29, 1949	Sept. 28, 1950	Sept. 27, 1951
Gold	65,200	182,875	191,447
Private discounts, loans	442,400	415,837	695,159
Advances to state	715,200	717,042	776,942
Liabilities			
Notes	1,210,600	1,467,425	1,779,360
Government deposits	200	94	60
Other deposits	138,800	156,931	168,272

The emergence of a substantial deficit in the country's external payments and the tendency for French capital to move abroad brought a substantial fall in the bank's holding of foreign currencies from April onwards. It also resulted in a substantial repayment of the loans granted by the bank to the exchange stabilization fund in 1950. The bank's gold holding was, however, largely maintained at the end-1950 level.

The rapid rise in internal prices and wage levels gave rise to a steady increase in the demand for currency and the note issue expanded by about 20% in the year to Oct. 31 despite the extensive purchasing of gold for currency stimulated by devaluation fears. The steep rise in the bank's private discounts and advances was the result of the private banks' inability to meet the demands made on them. (C. H. G. T.)

BAPTIST CHURCH. Political conditions in China in 1951 caused the withdrawal of missionaries with consequent new responsibilities for the native church. Sixty years'

accumulation of property was handed over by the British Baptist Missionary society to a responsible body in north China. In other mission fields progress was reported: the Southern Baptist convention of U.S.A. celebrated 100 years of missionary work in Nigeria and reported 325 missionaries in Latin America and 100 in Japan.

Statistical reports (not including Russian-dominated lands) indicated 15,412,967 Baptist church members in 1951. America reported the largest groups; the American (Northern) Baptist convention, 1,561,073 members; the Southern Baptist convention, 7,079,889 members; with 4,428,719 Negro Baptists in two conventions.

Baptists in Europe showed a marked recovery from the effects of World War II. At their biennial convention in Dortmund (September), German Baptists reported 100,149 church members, an increase of 18,000 since World War II. Reconstruction of the seminary in Hamburg was almost completed and plans accepted for a new publication house in Kassel. December saw the dedication in Hamburg of the newly built First Baptist church, in commemoration of Johannes G. Oncken, "Father of Continental Baptists." The Baptists of Denmark reported a 25% increase in youth organizations over the past 10 years, with an average of one new church a year. The newly formed European Baptist federation held its first full council meeting in Hamburg and planned the first conference to be held in Copenhagen in 1952.

The outstanding event of 1951 was the Commonwealth and Empire Baptist congress, held in London, with exhibitions and congress-weeks elsewhere in Britain in connection with the Festival of Britain. Strong delegations attended from Canada, Australia, New Zealand, South Africa and Jamaica.

Notable elections during 1951 were: K. S. Latourette (Yale), to the presidency of the American Baptist convention; Duke K. McCall to the presidency of the Louisville Theological seminary; Porter Routh to the position of executive secretary of the Southern Baptist convention and Ernest A. Payne to the position of general secretary of the Baptist Union of Great Britain and Ireland. (F. T. L.)

BARBADOS. British colony, the most easterly of the Caribbean islands. Area: 166 sq.mi. Pop.: (1946 census) 192,841; (Dec. 1950 est.) 211,682. Language: English. Religion: Christian (c. 70% Anglican). Capital and chief port, Bridgetown (pop. 1948, 13,345). Administration: governor; executive council, 2 *ex-officio* members and nominated members; executive committee (which introduces all money votes and initiates all government measures), members of the executive council, 1 member of the legislative council and 4 from the House of Assembly; legislative council, not more than 15 appointed members; House of Assembly, 24 elected members. Governor, Sir Alfred Savage.

History. Heavy rainfall in the early months of the year—the normal dry season in Barbados—caused much disappointment to visitors. Thanks to very quick-drying soil the rain did not materially affect the harvesting of the largest sugar crop the island had had. An act to encourage the establishment and development of new industries, the Pioneer Industries (Encouragement) act, came into operation in 1951. It granted important measures of relief from customs duties and income tax to anyone establishing a factory for a new industry. Another act, which it was hoped might lead to even larger sugar crops than that of 1951, dealt with the control of underground water supplies. A third provided for increased levies on sugar and fancy molasses for the industry's labour welfare fund. The first elections under full adult franchise were held at the end of the year. It was doubtful, however, if the political campaign seriously distracted the attention of Barbadians from the exploits of the West Indian cricket team in Australia under the captaincy of a Barbadian,

John Goddard. The award to him of the O.B.E. gave great pleasure.

Education. Pupils in elementary schools (1950), 30,080; in secondary, 2,838. Expenditure: \$1,906,328.

Finance and Trade. Currency: British Caribbean dollar (\$4-80=£1). Budget (1951-52 est.): revenue \$10,576,000; expenditure \$10,425,000, excl. development. Foreign trade (1950): imports \$38,726,132; exports (incl. re-exports) \$27,643,000. Principal exports: sugar, fancy molasses, rum. Sugar crop (1951), 187,663 tons.

(P. H.-M.)

BARLEY: see GRAIN CROPS.

BARRY, SIR GERALD REID, British journalist (b. London, Nov. 20, 1899), was educated at Marlborough college and Corpus Christi college, Cambridge, and served in World War I in the Royal Flying Corps and the Royal Air Force. In 1924 he became editor of the London *Saturday Review* but resigned in 1930 following disagreements with the proprietors about editorial policy; within a few weeks of his resignation, however, he obtained sufficient financial backing from Samuel Courtauld (the textile industrialist and art connoisseur) and others to found the *Week-end Review* which he edited until 1934. From 1936 to 1947 he was managing editor of the *News Chronicle*; in an "open letter" to the government, in a 1945 issue of this newspaper, he suggested a nation-wide celebration of the centenary of the Great Exhibition of 1851. The outcome was the Festival of Britain 1951 (q.v.), of which Barry was appointed director general in March 1948. He also served on various government and press committees: in 1931 he was co-founder of PEP (Political and Economic Planning), a research and study organization. He was chairman of the press sub-committee, United Kingdom Body for Mass Communications, U.N.E.S.C.O. In the 1951 Birthday Honours, Barry was knighted. He was editor of the two issues of *The Week-end Calendar* (1932, 1934) and *This England* (1934).

BASEBALL. During 1951, Ford C. Frick was elected commissioner of baseball, succeeding Albert B. Chandler. The famous "Yankee Clipper," Joe DiMaggio, a most brilliant player, announced that he was retiring from the game. Two important player deals occurred during the year. Chicago White Sox secured from Cleveland Orestes Minoso, an outfielder-third baseman with amazing speed, who finished the year as the American league's second-highest batter and its leading base stealer. The New York Giants brought up 19-year-old Willie Mays from their Minneapolis farm. He became the regular centre fielder and his outstanding defensive play, 20 home runs and .274 batting average, contributed heavily to the pennant-winning cause. Mays was voted the National league "rookie of the year."

In the National league only one no-hit game was pitched, that by Cliff Chambers, then with Pittsburgh, over Boston on May 6. In the other circuit three such games were pitched. Allie Reynolds did it twice, once against Cleveland, and again on Sept. 28 against Boston, and Bobby Feller tossed the other against Detroit.

Major League Races. In the National league championship the Brooklyn Dodgers got off to an early lead, which, by mid-August, had become a 13-game advantage over the remainder of the field. The New York Giants, on the other hand, fared badly as the season got under way, suffering an 11-game losing streak. But as the season drew to a close the New York club was victorious in 38 of its final 45 games. This brought the two teams to the finish of the campaign in a dead heat and as a result it was necessary to play a two-out-of-three play-off series.

The Giants won the first game, 3-1. In the second the Dodgers routed the home club, 10-0, the winning pitcher being rookie Clem Labine. In the eighth inning of the third

game the Dodgers scored three times and led 4-1 when the Giants batted in the last inning. They had scored a run and had two men on base with only one out when Bobby Thomson, Giant third baseman, hit one of Ralph Branca's pitches into the left field stands to make the Giants National league champions for the first time since 1937.

Meanwhile the American league race was over. The Yankees clinched the flag with two days remaining on the schedule.

Individual Performances. Stan (The Man) Musial of St. Louis, led the National league in batting for the fifth time in his career with .355. American league batting honours went to Ferris Fain of the Philadelphia Athletics with a .344 average. Home run honours again went to Ralph Kiner of Pittsburgh, whose 1951 total was 42. In the American league the leading home-run producer was Philadelphia outfielder Gus Zernial who blasted out 33 round-trippers.

All Star Game. The National league defeated the American league, 8-3, before 52,075 in Detroit's Briggs stadium.

World Series. The New York Yankees defeated the New York Giants by four games to two to bring them their 14th world championship since 1923 and their third consecutive win.

Attendance. Major league turnstile figures declined from 17,462,977 in 1950 to 16,103,822 in 1951. (F. C. Fk.)

BASUTOLAND: see BRITISH SOUTH AFRICAN PROTECTORATES.

BAUDOUIIN I (BAUDOUIIN-ALBERT-CHARLES-LEOPOLD-AXEL-MARIE-GUSTAVE), King of the Belgians (b. Stuyvenberg castle, Brussels, Sept. 7, 1930). For his earlier career see *Britannica Book of the Year 1951*. As prince royal he acted as head of the state from Aug. 1950, when his father, King Leopold III, delegated to him the exercise of the royal prerogatives, until Leopold's abdication on July 16, 1951. He took the oath as King Baudouin I before both houses of parliament and the officers of state on July 17. In his accession speech he spoke of his father's having ended his reign by a self-denying gesture that had evoked the admiration of the nation. A civil list of Fr. 36 million (£257,143) was granted by parliament and Leopold was allowed to retain the courtesy title of King Leopold. King Baudouin celebrated his 21st birthday on holiday in the Austrian Tyrol. In Feb. 1951 he had visited Sweden for the 90th birthday of his grandfather, Prince Carl, and in April he went to Zermatt, Switzerland, for a short holiday. He went to Sweden again for the funeral, on Nov. 1, of Prince Carl.

BECHUANALAND: see BRITISH SOUTH AFRICAN PROTECTORATES.

BEDSER, ALEC VICTOR, England and Surrey professional cricketer (b. Reading, Berkshire, July 4, 1918), with his twin brother, Eric Arthur, excelled at games at Monument Hill school, Woking, and the Woking cricket club. Both were natural players and were given every encouragement by their parents. In 1938 they became members of the Surrey staff at the Oval. In the following year they each played twice for the first team. In World War II they served in the Royal Air Force. They left the services in May 1946, and Alec Bedser immediately established himself in county cricket as a medium-fast bowler. In that year he played in his first test for England. In the first two tests of 1946 against India he took 11 wickets in each game. Before the end of July he had taken his 100th wicket in his first county season. He ended the season with an average of 20.13 for 128 wickets. He toured Australia and New Zealand with W. R. Hammond's side in 1946-47 and played in all five tests against Australia.

Alec Bedser later played in tests in England against South Africa (1947), Australia (1948), New Zealand (1949), West Indians (1950) and South Africa (1951). He toured South Africa with F. G. Mann's side in the winter of 1948. In the English seasons since 1946 his record was: 1947, 24·428 for 130 wickets; 1948, 22·88 for 115 wickets; 1949, 21·30 for 110 wickets; 1950, 22·92 for 122 wickets; and 1951, 15·56 for 130 wickets. He again toured Australia and New Zealand with F. R. Brown's side in 1950-51. By the end of the 1951 season he had taken 152 wickets in test matches.

BEEKEEPING. The winter and spring before the apicultural season of 1951 were most discouraging and until quite late in the spring there was much anxiety among British beekeepers. Incessant rain and low temperatures had caused much hive dampness. Spring examinations revealed mouldy combs often packed with unusable pollen: bees therefore had to pull down and rebuild considerable areas in their brood chambers. Spring dwindling, acarine disease and common dysentery destroyed much valuable bee life. Losses of colonies were very high, variously estimated at as much as 50%. It was not until the middle of May that bees really got going, just when the spring feeding allowance of sugar was down to the last ounce. When the weather changed apiarists were pleased to see their colonies full of activity. It seemed that bees were never so busy before. Rapid development of brood nests and ideal weather put them right for the clover and lime period, but few beekeepers were solaced by any surplus from fruit blossoms or hawthorn. Nevertheless much surplus was finally harvested from many fewer colonies than in the previous year. Some beekeepers in the districts more favourable to bee-forage claimed 1951 as a bumper year, but the general conclusion was that honey-takes were only moderately good.

Honey quality left little cause for complaint. Good samples of light and medium honey were common; only in a few places did honey dew depreciate the yield. The large numbers of shallow combs and sections suitable for exhibition gratified show competitors. The nuisance of swarming was not so marked as usual. The period from June to August was especially kind to those who reared queens, and there was a high percentage of matings. It was noticed, however, that hedge sparrows had again developed their taste for eating light-coloured queens. Those who relied on returns from the heather were again disappointed, and weather conditions resulted in general failure on the moors.

Natural stores in brood chambers, supplemented by the sugar allowance, made it possible to pack down for winter with confidence. Educational work was not neglected and in September the 14th International Congress of Beekeepers was held at Leamington, Warwickshire, followed by a similar conference at Aberdeen. (W. H. R.)

BEER: see BREWING AND BEER.

BELGIAN COLONIAL EMPIRE. The Belgian colonial empire consists of the colony of the Congo in central Africa and the adjacent trust territories of Ruanda and Urundi administered with Congo. Total area: about 925,094 sq.mi. Total pop. (1951 est.): 14,929,200. Areas, populations, capital towns, status and governors of the separate territories are given in the table.

History. In 1951 the forces in the Belgian Congo amounted to 10,000 native troops. One unit was stationed at Kamina, the new Belgian military base in the Lualaba province, where

small Belgian forces were directing the construction of barracks, munition and petrol dumps, and an airfield. In 1952 Belgian airborne troops and commandos by turns were expected to be established there.

Exports from the Belgian Congo and from the trust territories Ruanda and Urundi during the first nine months of 1951 amounted to Fr.C. 14,205·2 million against Fr.C. 9,190·3 million during the corresponding period in 1950. Some 46% of the exports went to Belgium, whereas the homeland provided 40% of the imports of the colony.

The white population amounted to 59,157 including 44,028 Belgians, 1,009 Americans, 1,752 British, 1,849 Greeks, 1,754 Italians and 3,290 Portuguese.

For the fulfilment of the 10-year plan for the development of natural resources \$160 million were invested in 1951, through a loan by E.C.A. and the floating of a loan of Fr.Sw. 60 million, the latter being used for the payment of Swiss electrical equipment. The government published a similar 10-year plan for Ruanda and Urundi.

An agreement was signed with Great Britain, in April, for the construction of a deep-water berth at Dar-es-Salaam where the Belgian Congo already enjoyed special port facilities. At the end of the year a transport crisis caused by accumulation of goods developed at key points of traffic in the Congo. The licence system for imports and exports had to be revised to give priority to essential goods. (M. Ss.)

Principal Products. (Belgian Congo and Ruanda and Urundi; 1950, metric tons if not otherwise stated): copper, metal 193,917; tin, metal 14,792; cobalt 5,070; cotton 47,000; coffee 31,400; gum copal (exports) 12,476; gold ('000 fine ounces) 339; silver ('000 fine ounces) 4,469; (1949, metric tons if not otherwise stated) manganese ore 12,247; tungsten 169; cadmium 25; zinc, concentrates 109,263; coal 152,370; palm oil (exports) 121,766; palm kernels (exports) 80,034; maize 17,271; timber (exports) 71,313; diamonds (carats) 9,884,000.

Foreign Trade. (Belgian Congo and Ruanda and Urundi; Congolese francs million, 1950; 1949 in brackets): imports 9,559 (10,320), exports 13,595 (11,171).

Transport and Communications. (Belgian Congo and Ruanda and Urundi). Roads (1949): 111,971 km. Railways (1949): 4,756 km. Waterways (1948): 25,412 km., including 12,284 km. for barges of 40 gross tons. Licensed motor vehicles (Belgian Congo only, Dec. 1950): cars 11,500, commercial 12,000.

Finance. (Million Congolese francs) *Belgian Congo.* Budget: (1950 est.) revenue 4,032·2, expenditure 4,008·9; (1951 est.) revenue 5,125·5, expenditure 4,959·1. *Ruanda and Urundi.* Budget: (1950 est.) revenue 276·6, expenditure 325·2; (1951 est.) revenue 321·3, expenditure 363·9. Monetary unit: *Congolese franc*, nominally an independent currency, actually at par with the Belgian franc and in Sept. 1949 equally devalued by 12·34% to the U.S. dollar.

BELGIUM. Kingdom in western Europe bounded S.W. by France, N. by the Netherlands and E. by Germany and Luxembourg. Area: (incl. some German frontier localities annexed on April 15, 1949): 11,782·5 sq.mi. Pop.: (1947 census) 8,512,195; (1950 est.) 8,639,000. Language (1930): Flemish (Dutch) 42·92%, French 37·56%, German 0·85%, Flemish and French 12·92%, German and French 0·83%. Religion: mainly Roman Catholic. Chief towns (pop., 1948 est.; first figure including suburbs, second figure *commune* only): Brussels (cap., 1,296,687; 185,112); Antwerp (chief port, 794,280; 266,636); Liège (573,176; 156,664); Charleroi (445,229; 26,262); Ghent (442,792; 166,797); Namur (215,069; 31,637); Bruges (200,850; 52,984). Ruler, King Baudouin I (*q.v.*); prime minister, Joseph Pholien.

History. A long period of constitutional dispute ended in Belgium when, on July 17, 1951, Prince Baudouin took the oath in parliament and became the fifth king of the Belgians. After King Leopold's return to the country, on July 22, 1950, disorders had occurred and the king was persuaded to

Country	Area (sq.mi.)	BELGIAN COLONIAL EMPIRE		Capital	Status	Governor
		Population (1951 est.)				
Belgian Congo	904,974	11,132,000 (incl. 59,157 Europeans)		Léopoldville	Colony	Eugène Jungers, governor general
Ruanda	20,120	3,796,700 (incl. 2,805 Europeans)		Nianza	Sultanates,	
Urundi				Kitega	Trust territories	

transfer his royal powers to the heir of the throne who, on Aug. 11, 1950, took the oath and became the prince royal, pending his accession to the throne on Sept. 7, 1951, when he would be 21. However, in June, King Leopold suggested to the prime minister and to the presidents of the Christian Social, Socialist and Liberal parties to advance the accession to the throne because, in his opinion, calm and unity were sufficiently restored. On July 16, in the throne room of the royal palace in Brussels, King Leopold signed the abdication act.

Political. Pholien tendered the government's resignation after the accession ceremony, but King Baudouin asked him to remain in office. The government based on the Christian Social party retained a majority of 4 in the House of Representatives and of 7 in the Senate. The government party itself was an amalgamation of Roman Catholic peasants, workers, middle classes, industrialists and landowners. Changes in the government had been forecast, owing to controversies on economic and labour policy, but King Baudouin's decision put an end to the speculations, and Pholien always declared that an adverse vote in parliament alone should force him to reconstruct his cabinet or to resign. For months, contrary influences within his own party were brought to bear upon the prime minister. The House of Representatives reassembled on Nov. 6 to question the government. At the end of the debate a vote of confidence was passed but Pholien felt compelled to enter into negotiations for the appointment of a minister for co-ordination of economic policy. The prospect of a political crisis resulting in the dissolution of parliament and of new elections which might

destroy its present small majority kept the Christian Social government in the saddle.

Economic and Financial. The Korean war and rearmament in western Europe caused appreciable changes. The index of industrial production (1936-38=100) stood at 148.6 in Nov. 1951 compared with 122 in Jan. 1950. The metallurgical industry was prosperous, but in the textile industry the index fell from 151 in Nov. 1950 to 122 in Nov. 1951. In May ended the period of increased imports, mainly of raw materials, whereas exports reached in October the record figure of B.Fr. 12,474 million. The monthly average of exports in 1949 was B.Fr. 6,649 million. The increase of the cost of living since Sept. 1949 was estimated at 9% compared with 30% in France and 23% in the Netherlands. In the European Payments union, Belgium became the biggest creditor nation. At the end of September there was a credit overdraft of more than \$80 million, and in October the government introduced a series of measures to check speculative imports of capital from countries of the E.P.U. Imports of goods from the dollar area were restricted to promote purchases in the E.P.U. area. On the other hand exports to E.P.U. countries were discouraged by blocking 5% of the proceeds.

International. Co-operation between the Netherlands and the Belgo-Luxembourg Economic union continued, but the formal beginning of the Benelux Economic union was delayed because of the Netherlands balance of trade deficit. At the end of the year the three governments were examining the draft of a convention introducing economic union with some temporary restrictions. In March the Belgian delegates initialled the provisional convention on the Schuman plan for pooling the coal and steel resources of western Europe. Provisions were included in the convention to avert any closing down of Belgian coal mines during the first five years, but misgivings remained. Moreover the question was raised whether the submission to a supranational authority, not responsible to the Belgian parliament, was in accordance with the constitution.

Defence. In March parliament passed a bill extending military service from one to two years. The strength of the Belgian forces increased from 72,000 in 1950 to 110,000 in 1951. In 1952 the figure would be 130,000 and in 1954 the strength would amount to 163,000.

The construction began of 26 British camps in the area between Lier, Herentals and Turnhout for the supply of British forces in Germany. In January, the prince royal signed a decree placing the Belgian fighting forces at the disposal of the North Atlantic Treaty organization. The decree established a precedent because, by virtue of the constitution, the head of state is the commander in chief of the Belgian forces. At the time of the Atlantic council meeting in Rome (November) the question of a European army came to the forefront. The Belgian government considered such an army desirable provided it increased the strength of Atlantic defence, encouraged European unity and integrated western Germany into a western defence community; but many objections were raised as to the powers of the higher authority governing the European army and the amalgamation of Belgian and other troops at the risk of separating Walloon and Flemish soldiers to the detriment of Belgian unity.

(M. Ss.)

Education. Schools (Dec. 31, 1949): elementary, infant 4,050, pupils 289,791; primary 8,714, pupils 768,283; primary, adult 370, pupils 5,863; secondary, state, lower grade 97, pupils 43,772; secondary, state, higher grade 157, pupils 46,729; Catholic 463, pupils 66,633. Teachers' colleges (Dec. 31, 1949): infant 39, students 1,582; elementary 81, students 8,814; secondary 38, students 1,304. Universities (1949-50) 4, students 16,425.

Agriculture. Main crops ('000 metric tons, 1949; 1950 in brackets): wheat 596 (547); barley 247 (260); oats 587 (503); rye 258 (238); potatoes 2,047 (2,309); sugar, raw value 349 (445); linseed 16 (12); rapeseed 4 (3). Livestock ('000 head, Jan. 1951): cattle 2,020; sheep

Ex-King Leopold, his mother Queen Elisabeth and his son King Baudouin (left to right), passing a statue of King Albert (1875-1934) which was unveiled in Brussels on Oct. 21, 1951.

116; pigs 1,234; horses 247; goats 55; poultry 16,500. Dairy production (1949; 1950 in brackets): butter ('000 metric tons) 66 (73); milk (million litres) 2,970 (3,452). Meat production ('000 metric tons, 1949; 1950 in brackets): total 288 (318). Fisheries: total catch ('000 metric tons, 1948; 1949 in brackets) 70·9 (68·3).

Industry. Industrial establishments (Jan. 1948): 248,128; persons employed 1,000,010. Fuel and power (1950; 1951, six months, in brackets): coal ('000 metric tons) 27,300 (14,895); manufactured gas (million cu. m.) 1,446 (829); electricity (million kwh.) 8,484 (4,653). Raw materials ('000 metric tons, 1950; 1951, six months, in brackets): pig iron 3,696 (2,378); steel ingots and castings 3,768 (2,472); copper smelter 137 (72); lead 62 (31); zinc 177 (99); tin 10·4; aluminium 1·9. Manufactured goods ('000 metric tons, 1950; 1951, six months, in brackets): cement 3,552 (2,110); woven cotton fabrics 74 (45); cotton yarn 98 (55); wool yarn 40 (20); rayon filament yarn 9·8 (6·2); paper and cardboard 301·2 (171·0).

Foreign Trade. (Belgo-Luxembourg Economic union, million francs, 1950; 1951, six months, in brackets): imports 97,500 (65,604); exports 82,572 (64,177). Main sources of imports (1950): U.S. 16%; France 11%; Netherlands 10%; U.K. 8%. Main destinations of exports: Netherlands 22%; France 9%; U.K. 8%; U.S. 8%. Main imports: machinery and vehicles 14%; raw wool and cotton 13%; grains 6%; coal, petroleum and products 6%. Main exports: iron, steel and manufactures 19%; thread and fabrics 15%; non-ferrous metals and manufactures 11%; machinery and vehicles 9%.

Transport and Communications. Roads (1949): 6,648 mi. Licensed motor vehicles (Dec. 1950): cars 273,599; commercial 144,566. Railways (1950): 3,128 mi.; passenger-mi. 4,377 million; goods, ton-mi. 3,393 million. Shipping (merchant vessels of 100 gross tons and over, July 1950): 222; total tonnage 481,656. Navigable waterways 969 mi. Air transport (1950): passenger mi. 146 million; cargo, ton-mi. 5,257,000. Telephones (Dec. 1949): subscribers 471,705. Wireless receiving sets (1949): 1,374,400.

Finance and Banking. (Million francs) budget: (1951 est.) revenue 73,400, expenditure 68,300; (1952 est.) balanced at 70,500. National debt (Aug. 1950; Aug. 1951 in brackets): 248,735 (246,970). Currency circulation (July 1950; July 1951 in brackets): 92,200 (94,600). Gold and foreign exchange (million U.S. \$, Aug. 1950; Aug. 1951 in brackets): 794 (935). Bank deposits (June 1950; June 1951 in brackets): 63,600 (64,700). Monetary unit: Belgian franc, with an exchange rate (Aug. 1951) of B.Fr. 140 to the pound and B.Fr. 50·37 to the U.S. dollar.

BEQUESTS: see DONATIONS AND BEQUESTS.

BERLIN. Capital of the German Reich from 1871 to 1945, Berlin was still by 1951 the largest city of Germany. Area: 343·6 sq.mi. Pop.: (1939 census) 4,321,500; (1946 census) 3,179,200, or 24·4% less. From June 6, 1945, to June 24, 1948, Berlin was administered by an inter-Allied government authority (in Russian, Kommandatura) consisting of the commandants of the four sectors of Berlin. After June 24, 1948, when the Soviet commandant proclaimed the dissolution of the Kommandatura, Berlin was in fact divided into two opposing administrations. By Dec. 31, 1951, the three western sectors (pop., c. 2,500,000) were under the authority of the three following Allied commandants: Great Britain, Major General C. F. C. Coleman; United States, Brig. General Lemuel Mathewson; France, General Pierre Carolet. In the Soviet sector (pop., c. 900,000) the civil administrator was Serghey S. Dienghin with A. F. Susin as deputy. There were also two rival German city governments and two lord mayors. Professor Ernst Reuter was *Oberbürgermeister* appointed by a city assembly elected by the population of the three western sectors; Fritz Ebert was provisional *Oberbürgermeister* of the Soviet sector appointed by a meeting summoned by the Sozialistische (Communist) Einheitspartei.

History. By the end of 1951 West Berlin was still not included as the 12th Land in the federal republic, but it now had 19 non-voting deputies in the Bonn parliament, instead of 8. The extra 11, chosen according to party strength, were: 4 Socialists, 4 Free Democrats and 3 Christian Democrats. Ernst Reuter was re-elected lord mayor, by 77 out

The scene in the Titania Palast theatre in the western sector of Berlin on Aug. 7, 1951, when Paul G. Hoffman, president of the Ford foundation, announced a grant of \$1,309,500 to the West Berlin free university.

of 125 votes, on Jan. 17, even though his party, the Socialist, did not have the absolute majority.

Attempts by Soviet and Eastern German authorities to "needle" West Berlin, particularly to upset its normal trade communications with the west, continued. Interferences with interzonal waterways traffic was settled on May 4, and the holding up of mail to and from Western Germany on Sept. 6. The sudden introduction of an excessive *Autobahn* tax for Western German and West Berlin transport using the special international highway between Berlin and Helmstedt (British zone) lasted three weeks (Sept. 7-22), when the tax was considerably reduced.

In February Soviet authorities took over West Staaken, a small village on the outskirts of the British sector. Though technically belonging to the Soviet zone since 1945, it had been included in the administration of Berlin-Spandau. Eastern German police seized in October the hamlet of Steinstücken, just a mile beyond Zehlendorf and administratively under that suburb. When the U.S. commandant protested, the Soviet authorities ordered their police to withdraw.

West Berlin's main problem was still economic. At the end of November the number of unemployed was 265,000 and more than 25% of these were between the ages of 14 and 30 years, thus constituting a great social problem. Industrial production, as compared with that at the end of the blockade (May 1949), had almost trebled by the summer of 1951, but the production index still lagged far behind that of Western Germany. It was still only 50% of that for 1936, whereas for Western Germany it was 35% above. West Berlin was well equipped to meet the demands for electrical goods of all sorts, precision and optical instruments, pharmaceutical products, etc. About 75% of the 1951 exports went to European countries and the rest overseas. Investments for creating employment amounted to DM. 706·9 million in 1949-50, and to DM. 953 million in 1950-51. DM. 166·9 million and DM. 273 million respectively were from foreign sources. Budget deficits under the

abnormal conditions prevailing were the rule. The federal republic promised at the end of October an additional DM. 550 million monthly from the *Notopfer Berlin* funds to help to tide over these difficulties.

On Sept. 28 Lord Mayor Reuter outlined a seven-point programme of the Berlin Senate which included: political incorporation of West Berlin in the federal republic, greater financial credits for industry, building schemes, security of unhindered traffic to and from the city, and other matters.

In addition to the usual unemployed, the escape to the western sectors of the city of about 3,000 refugees monthly from the Soviet zone was a serious strain on resources. Though only about 25% of these were accepted as genuine political victims, nevertheless they had to be fed and housed until transferred to Western Germany.

Despite its difficulties, West Berlin had done much to clean and improve its general appearance. Great improvements were noticeable in the streets and the parks, and many international exhibitions were organized, particularly the September Festival of Music and Drama which rivalled many of those of prewar days. An exhibition of a different sort was that of German industry (Oct. 6-21).

An outstanding U.S. gift, on Aug. 6, was that of \$1,309,500 from the Ford foundation to the Free University of Berlin for building an auditorium and a student's mensa. (By 1951 this university had 2,000 students.)

East Berlin moved very slowly, with little of importance to record. In fact, one local humorist suggested that it only came to public attention once a year—with the holding of the gigantic Communist rally. The 1951 Youth Festival brought together about 1,500,000 members of the Free German Youth (*Freie Deutsche Jugend*). Most of them were from Communist-controlled areas, but only about 11,500 F.D.J. crossed from the western zones of Germany. Unlike the 1950 festival, which was intended to demonstrate the strength of the movement among the youth, this year's festival was taken up with a programme of sport and entertainment. But propaganda was not forgotten. The festival, however, was not a great success. It lasted too long (Aug. 5-19), and despite the efforts of the Volkspolizei thousands of the F.D.J. crossed over into West Berlin where they were welcomed by the people and carried back home views of the free world which could not have been pleasing to the Communist authorities.

The East Berlin city council did little to improve the drab, shabby appearance of most of the city under its administration. The only exception was its principal street, *Unter den Linden*. Here, the Soviet embassy (completed after two years' work) stood out as a modern but much overdone structure. And the former *Lustgarten*, renamed *Marx-Engels square*, was more than ever like a miniature Red square. In political, economic and cultural policies, East Berlin followed unquestioningly the line laid down by the Eastern German Communist government. As the split in the city continued, it was surprising that in so many services which they shared in common (for example, transport) conditions were so near normal. (J. E. Wt.)

BERMUDA. British colony, c. 300 small islands 580 mi. east of Cape Hatteras, North Carolina. Area: 21 sq.mi. Pop. (1950 census): 37,254. Language: English. Religion: Christian. Chief towns: Hamilton (cap., c. 3,500); St. George (c. 1,300). Administration: governor; executive council, 4 official and 3 unofficial members; legislative council, 3 official and 6 unofficial members; House of Assembly, 36 elected members. Governor, Lieut. General Sir Alexander Hood.

History. The Royal Naval dockyard, as expected, closed on March 31, 1951, although Bermuda remained the base of

the American and West Indian squadron. No definite plan materialized for the solution of the problems caused by the closing of the dockyard. A commission which investigated the growth of population and illegitimacy recommended that steps be taken at once to restrict population growth. The House of Assembly decided not to appoint another select committee to consider extension of the franchise. Plans for developing a commercial tuna fishing industry centred on Bermuda were discussed at the Bermuda Oceanic Fisheries conference.

Education. Schools (1949): aided 27 (attendance 5,701); attendance at private schools, 1,251.

Finance and Trade. Currency: Bermuda pound (at par with sterling). Budget (1950): revenue £2,009,463; expenditure £1,969,022. Foreign trade (1950): imports £8,208,376; exports £962,646. Principal exports were cut flowers. The economy of the colony rested on the tourist trade. Tourists: (1950) 71,260 (incl. 61,654 from the United States); (first eight months of 1951) 73,000. (J. A. Hu.)

BETTING AND GAMBLING. In April 1951 the Royal Commission on Betting, Lotteries and Gaming presented its report, *Betting, Lotteries and Gaming, 1949-51* (Cmd. 8190, H.M.S.O., London, 1951). The commission had been appointed in April 1949, under the chairmanship of H. U. Willink, to "inquire into the existing law and practice relating to lotteries, betting and gaming, with particular reference to the developments which have taken place since the report of the Royal Commission on Lotteries and Betting in 1933, and to report what changes, if any, are desirable and practical." The commission held 25 meetings for hearing oral evidence and 17 meetings for discussion, and heard evidence from 141 witnesses. The cost of the inquiry was £11,695.

The law and public opinion had previously been confused on the subject of betting, lotteries and gaming. The unanimous report of the royal commission recommended that the law be clarified, and in giving its reasons for this proposal, reviewed with clarity and fairness the evidence upon which an informed public opinion must be based. The commissioners made no attempt to appease the strongly held views of the pro-, or anti-gamblers. They heard all sides and from the evidence they reached an independent, sensible and well-argued conclusion.

The laws relating to gambling were diverse, often illogical, and always difficult to enforce. For in the past legislation had always been piecemeal and often negative. Acts still in force in 1951 dated from 1541 when Henry VIII tried to protect his subjects against the distractions from archery. In the intervening years there arose a maze of legislation embodied, mainly, in the Betting act, 1853, the Street Betting act, 1906, the Ready Money Football Betting act, 1920, the Race Course Betting act, 1928, and the Betting and Lotteries act, 1934. The commission proposed that all these laws should be consolidated into a single statute and, in any event, that all statutes, other than the Race Course Betting act and the Betting and Lotteries act, should be repealed.

The commission stated as a principle that: "It is the concern of the state that gambling, like other indulgences such as the drinking of alcoholic liquor, should be kept within reasonable bounds, but this does not imply that there is anything inherently wrong in it." And in support of the commission's suggestion that the state should control gambling as it did drinking, while making no attempt at prohibition, its proposal that betting shops for off-the-course cash bets should be allowed under licence and strict police control, seemed to be a moderate encouragement to gambling rather than a deterrent. But this proposal was favoured by every witness with practical experience of the enforcement of present laws, only the bookmakers' associations and the churches' committee, in unusual alliance, being opposed to it.

It was a logical development of the argument for state control as against prohibition, and the only way to avoid the uncontrollable evils of street betting. The commission recommended a scheme similar to that concerning the licensing of public houses in Great Britain, with safeguards against loitering and excessive gambling similar to those against excessive drinking.

The commission's other proposals were less controversial: (1) that all bookmakers should be registered and required to renew a "certificate of eligibility" every year, and only such bookmakers should be allowed to conduct betting either on credit (as the law permitted in 1951) or in the proposed betting shops; (2) that it should be an offence for any bookmaker to bet with a person "apparently under 18 years of age"; and (3) that it should be an offence for anyone under 18 to enter a betting office. There would be heavy penalties, including cancellation of the licence, for any breach of the betting laws.

On football pools the commission proposed that any one prize "must not exceed a specified amount." It did not specify a particular sum, but said, "We think that the limit should not be higher than £20,000, but that it would not be reasonable to make it less than £10,000." The commission would prohibit abbreviated permutations, because this "is a convenient method of staking relatively large sums by persons who take little interest in the result of individual matches." And any commission, expenses or other amount (taxation) charged by the promoter against the gross stakes must be charged against the total stakes in each pool in the proportion which the total stakes in that pool bear to the gross stakes. The total amount paid to winners in any pool must be equal to the total stakes in that pool, less any amount deducted in accordance with the preceding recommendation, and they may not be supplemented from any other source.

These recommendations appeared to aim at preventing the very large prizes as a means of attracting those persons who might not normally gamble. The commission based its proposals for controlling football pools on three points: (1) that it is desirable that the fullest possible information should be available to the public, in view of the large sums involved and the widespread interest; (2) that there are special opportunities for fraud by the promoter; and (3) that the promoter can offer special inducements to gain wide publicity and to encourage people to gamble. The commission stated that "it is clearly a most unhealthy feature in the conduct of this form of betting that some of its promoters find it necessary to resort to practices about which they are reluctant to submit detailed information to a Royal Commission, even when an assurance has been given that no detailed information submitted by individual promoters would be made public."

The commission made proposals about amusement arcades, dog racing, lotteries and competitions, and totalizator betting. It was, however, on the publication of information relating to gambling that the commission's proposals were of importance and on this subject it endeavoured to give precise figures for the expenditure of money and labour on gambling. It found that the net expenditure on gambling was approximately £70 million a year, a figure far less than that given by the churches' committee. "Figures of the total stakes in all forms of gambling must give a wholly misleading picture of the importance of expenditure on gambling as a whole." In a comparison with the amounts spent on tobacco, or drink or entertainment the total amount spent on gambling was about 8% of the total personal expenditure. The commission stated that the total number of persons employed full-time or working on their own appeared to be 47,000 and the number of part-time employees about 30,000. The number of whole-time employees was, therefore, less than 5% of the total number of employed persons. The commission, working from the national income statistics, calcu-

lated that, in recent years, gambling had absorbed about 5% of the total annual flow of national resources and that the figure for personal expenditure could not be higher than 1% of the total personal expenditure.

The only official statistics for Great Britain are given in the table.

PUBLIC EXPENDITURE ON THE PRINCIPAL FORMS OF BETTING IN GREAT BRITAIN, 1949-51.

	1949	1950	1951
Totalizator at racecourses	£25.8*	£25.5*	£25.5*
Totalizator at dog tracks	£85.6†	£70.4†	£66.6‡
Pools (all forms)	£64†	£52.3†	£54†

United States. During 1951 the *New York Times* asked its correspondents all over the world to describe the gambling picture as each found it in his quarter—facts and arguments for and against legalized betting, for and against state operation of betting establishments, for and against the states' drawing revenue from gambling, for the police viewpoint as well as the gamblers', for the churchmen's stand, the legislators' and the view from the bench.

The Senate Crime Investigating committee in the United States devoted many months of 1950-51 to the gambling problem, and had prepared its report in 1951. Headed by Senator Estes Kefauver of Tennessee, the committee estimated that illegal gambling in the U.S. totalled \$20,000 million annually. It recommended legislation to ban interstate transmission of racing information and other sporting odds and results, and also proposed that the Bureau of Internal Revenue should compel gamblers to keep detailed records of winnings and losses, and forbid them to deduct losses and business expenses from their income taxes. However, the Federal Communications commission would not undertake to police such dissemination of information, and some legislators maintained that to cut off racing news service, for example, constituted an abridgment of the freedom of the press. There was some support for the legalization of gambling, but prosecutors opposed such legislation, their opinion being that it might reduce corruption at the police and ward politician level, but that it would force a rise in corruption at higher levels.

The legislation resulting from the investigation in the U.S. required gamblers, on or before Nov. 30, 1951, to register with their district collector of internal revenue, to pay a *pro rata* tax of \$50 a year, and thereafter to collect and remit as tax 10% of their gross receipts. On Dec. 4, the Bureau of Internal Revenue announced that 7,706 individuals in the U.S. had registered as gamblers. This figure might be compared with an estimated 15,000 bookmakers in New York city alone.

At the end of the year, U.S. gamblers were "lying low." Their opinion seemed to be that the country was momentarily intoxicated with reform emotionalism, but would get over it, and that it would survive it as it had survived other anti-gambling crusades. The sale of "scratch sheets" diminished by 40% to 90% in most large cities. The arrest of bookmakers decreased by more than 80%.

In the drive against gambling, racing received the greatest attention because at least some betting on horse races was legal in a majority of the states. Racing men, however, contended that as much or more money was betted on baseball, basketball, football and elections. A Gallup poll showed that 57% of the population of the U.S. gambled, however mildly, and that their preference in gambling (in order) was bingo or raffles, cards, punchboards, sporting contests, slot machines, horse racing, sweepstakes, elections and the numbers game.

(M. BER.)

BEVAN, ANEURIN, British politician (b. Tredegar, Monmouthshire, Nov. 15, 1897), was educated at Serhowy elementary school. The son of a miner, he started work as a collier's help at 13, was chairman of a miner's lodge before he was 19 and in 1921 led unemployed miners seeking help from the poor law authorities. After studying at the Central Labour college, London, he threw himself into local politics, first as a member of the Tredegar Urban District council and, in 1928, as a county councillor. He was elected to the House of Commons for Ebbw Vale, Monmouthshire, in 1929. Throughout World War II he was a bitter and unrestrained critic of Winston Churchill's coalition government. But he was equally outspoken within his own party and in 1939 had been expelled, along with Sir Stafford Cripps, for taking part in the popular front movement; he was re-admitted, however, later in the year. He was editor of *Tribune*, an independent Socialist weekly, from 1940 until he became minister of health in 1945. Elected to the Labour party executive in 1944, he headed the poll in the elections to the executive every year from 1946.

As minister of health in Clement Attlee's government of 1945 Bevan was responsible for setting up the national health service as well as having charge of the housing programme. He became minister of labour in Jan. 1951, but in April resigned from the government, along with Harold Wilson, president of the Board of Trade, because he disagreed with the scale of rearmament budgeting and with the apportionment of the burdens of expenditure among the different social classes; he said, however, that he and his supporters in the House of Commons would do nothing to contribute to the defeat of the Labour government. In the general election of Oct. 25, 1951, Bevan was again returned for Ebbw Vale, with a slightly increased majority. (R. JA.)

BHUTAN. Indian-protected state on the borders of Tibet. Area: c. 18,000 sq.mi. Pop. (1947 est.): 300,000, chiefly Bothias. Language: dialect of Tibetan. Religion: mainly Buddhist. Capital, Punakha. Ruler, Maharaja Jigme Wangchuk.

Despite the approach of Chinese troops to the northeastern frontier—they reached Tsona Dzong in August—the year 1951 was uneventful. Implementing promises made at the time of signing the Indo-Bhutan treaty of 1949, the Indian parliament on Aug. 8 passed a bill ceding to Bhutan a strip of territory (32·81 sq.mi.) known as Dewanagiri, hitherto included in Assam. The cession had been approved by the Assam legislature on March 27. Bhutan's original claim was for a much larger area but eventually the two parties agreed on the tract selected. This gesture helped to cement the cordial relations existing between the protectorate and India. (E. HD.)

BILLIARDS AND SNOOKER. The world's professional billiards championship was revived (last winner: Walter Lindrum, Australia, 1934) and was won by Clark McConachy, New Zealand, who beat John Barrie, England, by 9,294 points to 6,691. The British empire amateur billiards championship was changed in name to the world's amateur championship and the ninth contest took place in London, Robert Marshall, Australia (holder, 1938) winning again, with Frank Edwards, England, second. Frank Edwards triumphed for the third time running in the English amateur billiards championship, by beating Joe Tregoning by 5,015 to 3,791.

The world's professional snooker championship was won by Fred Davis who beat Walter Donaldson by 58 frames to 39. Fred Davis also won the United Kingdom professional billiards championship, by a win over Kingsley Kennerley, 8,120 to 6,011. The amateur snooker championship was

won by 17-year-old Rex Williams who beat Percy Bendon, a former holder, by 6 frames to 1. Williams turned professional. The women's amateur billiards and snooker titles went to Helen Futo and Pat Holden respectively. There were no contests in the women's professional events. (R. HO.)

United States. In Chicago, 63-year-old Willie Hoppe won, with six consecutive victories, his tenth world three-cushion championship since 1936 and his seventh in succession. Hoppe's opposition consisted of Joe Chamaco of Mexico City, Art Rubin of Brooklyn and Joe Procita of Los Angeles, who finished in that order in the 1951 national championship. Willie Mosconi of Haverford, Pennsylvania, retained his world pocket-billiard title, also with six straight wins. Mosconi defeated George Chenier, the Canadian champion, and Joe Canton, the new national title-holder, in his last two contests. The fourth competitor was Irving Crane, the 1950 national champion. (P. BR.)

BIOCHEMISTRY. *Amino Acid Sequence in Insulin*. The mechanism by which proteins exert their biological action received much attention during 1951. One of the primary goals in this field had been to learn more of the structure of proteins. Work in previous years had revealed a great deal of the amino acid composition of proteins and of the size and shape of these large molecules. However, two important problems remaining unsolved were: (1) the sequence of the different amino acids in the peptide chain and (2) the manner in which the peptide chain is folded and held together to give a specific configuration.

A very notable advance in this field was the publication of the amino acid sequence in the B chain of the protein hormone insulin by F. Sanger and H. Tuppy. Insulin was chosen for this work because it seemed a relatively simple polypeptide to analyse when compared with other proteins. The results indicated that crystalline insulin was a large molecule composed of six to eight identical sub-units each having a molecular weight of about 6,000. These sub-units were found to consist of two different polypeptide chains (A and B) linked together by two disulphide bonds (-S-S-). These disulphide bonds were broken by gentle oxidation. The two chains were separated from each other by virtue of the fact that chain A is acidic, containing no basic amino acids, while chain B, on the other hand, contains many basic amino acids. Chain B, a polypeptide of 30 amino acids residues, contains only 15 different amino acids. For a structure containing this number of amino acids it can be computed that at least 5×10^{27} isomeric sequences can exist.

Sanger and Tuppy identified every bond in the natural occurring polypeptide. Chain B was partially hydrolyzed by a variety of procedures to yield mixtures of di-, tri-, tetra- and even larger peptides. This was done by the use of acid or alkali at room temperature and by a number of proteolytic enzymes including pepsin, chymotrypsin and trypsin. These peptides were separated from each other by such newly developed analytical techniques as filter-paper chromatography, ion-exchange chromatography, adsorption analysis and ionophoresis. The actual structure of the individual peptides was then determined by means of the reagent 2,4-dinitrofluorobenzene which reacts with the free amino groups to form a stable derivative. The composition of each peptide could thus be determined. Since the different hydrolytic procedures break different bonds in the polypeptide, the identification of all the individual peptide structures made it possible to derive the sequence of the amino acids in the B chain. Using Sanger's notation and the standard abbreviations for the amino acids the complete amino acid sequence in the B chain of insulin is: phe.val.asp.glu.his.leu.cys.gly.ser.his.leu.val.glu.ala.leu.tyr.leu.val.cys.gly.arg.gly.gly.phe.phe.tyr.thr.pro.lys.ala.

Protein Structure. An important contribution to the theory of protein structure was made by L. Pauling and R. B. Corey. Data from X-ray diffraction analysis was used as a basis to suggest spatial arrangements in which the polypeptide chains in various proteins are organized. According to these workers the α -keratin type of protein structure which is found in fibrous proteins such as unstretched hair, horn and contracted myosin (a protein component of muscle) can be pictured in the following manner. The peptide chain exists in the form of a helix. This structure is held in place by hydrogen bonds which are formed between all the carbonyl groups of the peptide bonds and the NH groups of the peptide bonds three residues away along the chain. This hydrogen bonding extends across nearly a complete turn of the helix and determines the actual configuration of the structure. Pauling calculated that there are 3.7 amino acids per turn of the helix and that the distance between the side chains of adjacent amino acids is 1.72 Å. The organization of the polypeptide chains in stretched hair, silk and muscle proteins, or the β -keratin structure, is stated to consist of almost linear chains of the polypeptides in which the hydrogen bonding, instead of being between amino acids in the same chain, is between adjacent chains. In this extended structure the distance between the side chains of adjacent amino acids in the polypeptide is 3.32 Å.

Carbohydrate and Fat Metabolism. Investigations in 1951 clearly identified the "active" two-carbon (C_2) intermediate which is formed during carbohydrate and fat metabolism. It had been found previously that pyruvate, acetate and the oxidation products of fatty acids are converted to common C_2 fragment which participated in such reactions as the formation of citrate or of acetoacetate. This active C_2 compound is apparently a derivative of coenzyme A. This coenzyme was discovered by F. Lipmann as an essential factor for enzymic acetylation reactions.

The mechanism by which acetate is condensed with oxalacetate to form citrate was not known until 1951. Since at least 50% of the energy in fatty acids is released when acetate is oxidized via the citric acid cycle, the details of the initial condensing step in this cycle were of considerable interest. It was demonstrated that both coenzyme A and adenosine triphosphate (ATP) were necessary to condense acetate and oxalacetate. The energy of the phosphate bonds of adenosine triphosphate is used to activate coenzyme A so that it can react with acetate to form acetylCoA. AcetylCoA in the presence of another enzyme can spontaneously condense with the 4 carbon acid oxaloacetate to form the 6 carbon acid, citrate. AcetylCoA thus seems to be the metabolically active form of the C_2 fragment.

Nucleic Acids. Some progress was made in understanding the biological significance and the chemistry of the nucleic acids which occur in all cells. Desoxyribonucleic acid (DNA) was found to be intimately concerned with self-replicating structures such as nuclear genes, viruses and with certain substances known as "transforming principles." The transforming principles cause hereditary changes in micro-organisms when added to the growth medium.

With the advent of refined analytical techniques, it was shown that the DNA concentration in a cell is directly proportional to the number of chromosomes; *i.e.*, a sperm cell has only half the amount of DNA as the majority of body cells containing diploid nuclei. In different tissues of the same species the DNA appears to have the same composition. However, in different, but even closely related, species the DNA composition is different. From these and other facts it appeared that DNA might be "the hereditary code-script of living material." (L. M. K.)

BLOOD, DISEASES OF THE. ACTH (corticotropin, derived from the anterior pituitary) and cortisone (an adrenal cortical extract, Compound E) had left their imprint on many phases of medicine since their introduction first into experimental and then clinical use. Although the fundamental mechanisms by which these hormones act upon diverse bodily tissues remained obscure at the close of 1951 in the case of the blood-forming tissues and the blood cells, numerous "yardsticks" permitted evaluation of their activity. Thus, ACTH causes a simultaneous increase in the productivity of the cells of the bone marrow, *i.e.*, the red cells, the polymorphonuclear white cells and the platelets, and a decrease in the productivity or even a destruction of the lymphocytes. This might point to a reciprocal or antagonistic relationship between these two types of cell tissues. A curious effect is on the blood eosinophile which, under the influence of sufficient hormone therapy, disappears completely from the blood. This also occurs under conditions of extreme stress. As pointed out by Hans Selye, various types of stress (excitement, infections, physical injuries of various types) induce a simultaneous rise in the total number of white cells and in the polymorphonuclear cells, a drop in the lymphocytes, and a complete disappearance of the eosinophiles.

The deterrent or inhibitory effect of ACTH on the lymphocytes is associated with an effect on the production of antibodies which become materially reduced. Antibodies, which are usually helpful in fighting disease, are produced by the body in response to infections and at times by other mechanisms. Sometimes antibodies are produced in excess or are actually harmful. One type of abnormal and harmful antibody response occurs with the development of anti-red cell antibody. This development results in injury to the red cell and thus in haemolytic anaemia. The possibility was conceived that ACTH might diminish antibody production and thus stop the haemolytic disease. This actually ensued, with the result that the treatment of one type of haemolytic anaemia, *i.e.* the acquired form, was actually revolutionized. Whereas previously, surgical removal of the spleen (splenectomy) and transfusions were the only modes of therapy available, by 1951 almost all cases showed either a partial or complete response to ACTH or cortisone. This occurs if the acquired haemolytic anaemia is either of unknown cause (idiopathic) or due to some fundamental disease such as leukaemia. The abnormal antibody in the blood becomes greatly reduced and this is followed by a simultaneous decrease in the destruction of red cells and an increase in their production. The use of these hormones is without value in the hereditary types of haemolytic anaemia, in which the fundamental fault lies in the red cell structure and not in an abnormal antibody mechanism.

The effect of ACTH in reducing the activity of lymphoid tissue was used in the treatment of certain types of leukaemia, particularly of the acute lymphocytic variety. Unfortunately,

although the immediate results were often striking, they were temporary. A cure for leukaemia had not been forthcoming by the close of 1951, although the fact that even temporary states of improvement might occur in the acute forms was remarkable in itself, and suggested that the problem might not be as hopeless as it seemed. The main hope in leukaemia would seem to be in determining the causative factors, rather than in a hit-or-miss attempt to find a cure.

Since ACTH is to some extent a marrow-stimulating agent, it was tried in conditions in which marrow activity is depressed, as in aplastic anaemia. It was also used in thrombocytopenic purpura, a bleeding disorder in which the platelets in the blood are reduced. Some cases of both these conditions showed a favourable response to this form of therapy, but the results were inconstant and only occasional cases were benefited.

Certain diseases are apparently caused by the development of an immune reaction so out of proportion to what is needed that it does more harm than good. Thus, an immune reaction against a certain germ which invades the body is beneficial, but when there is overshooting, harm may ensue. This is seen in a certain type of bleeding condition known as Henoch-Schönlein purpura, in which the excessive immunologic build-up appears to result in injury to small blood vessels throughout the body, and thus to bleeding into the skin, the joints, the bowel and other tissues. In another form of purpura (black and blue spots, little blood spots or petechiae), called idiopathic thrombocytopenic purpura, the disorder may also be initiated as a reaction of immunity. There, the blood platelets are destroyed by some sort of mechanism which attacks the person's own platelets. This is the mechanism behind the disorder of acquired haemolytic anaemia; there the person acquires an immunity against his own red cells, which are then destroyed by the antibody produced by the tissues. In other unusual conditions known as periarteritis nodosa and disseminated lupus, a hyperimmune state seems to have been set up with the result that connective tissue throughout the whole body becomes involved. The relationship of these various phenomena of immunity to allergic states and to the steroid hormones mentioned is not quite clear. However, the administration of ACTH and cortisone in these various conditions was often beneficial. (See also HEART DISEASES.) (W. Dk.)

BOLIVIA. Land-locked republic in central South America and one of the highest inhabited areas of the world. Area: 416,040 sq.mi. Pop.: (1900 census) 1,816,271; (mid-1949 est.) 3,990,000. Estimated racial distribution: Indian 52%; *mestizo* 28%; white 13%; Negro 0.2%; unspecified 6.8%. Language: Spanish, but the Indians speak Quechua and Aymará. Religion: predominantly Roman Catholic. The legal capital is Sucre (pop., 1946 est., 32,000); the actual seat of government is La Paz (pop., 1946 est., 301,000). Other chief towns (pop., 1946 est.): Cochabamba (80,000); Oruro (50,000); Potosí (40,000). Presidents of the republic in 1951: Mamerto Urriolagoitia and (from May 16) General Hugo Ballivián.

History. Despite the fact that a presidential election was held in May, Bolivian politics continued during 1951 to be among the most unstable in the western hemisphere. On Feb. 16 outgoing President Urriolagoitia reorganized his cabinet in the hope that a new coalition administration would ensure order at least for the duration of the presidential campaign. Six candidates presented themselves for the presidency: chief among them were Gabriel González, the administration's candidate, and Víctor Paz Estenssoro,

leader of the opposition Nationalist Revolutionary movement (M.N.R.), which had conducted a bloody despotism in 1943-46. Though a legal contestant for the presidency, Paz Estenssoro was forced to conduct his campaign from his Argentine exile. When he unsuccessfully attempted to return to Bolivia on April 14, widespread rioting occurred, during the course of which La Paz police, on April 15, killed one and arrested 81 demonstrators.

The presidential election, held on May 6, served only to heighten political and constitutional tension. According to the country's constitution, a presidential candidate must receive a majority of the popular ballots to be elected, and none of the six candidates polled the required number of votes. Paz Estenssoro, with 45% of the popular vote, received more votes than any other presidential aspirant. The constitution provides that, in the event that no candidate polls a majority of the ballots, congress should choose the new president from among the three candidates with the largest numbers of votes. However, outgoing President Urriolagoitia and his advisers were reluctant to comply with this stipulation for fear that it would deliver the government to Paz Estenssoro and the M.N.R.

Rather than risk a resumption of M.N.R. rule, Urriolagoitia resigned from the presidency on May 16, entrusting the administration to an army junta under the leadership of General Hugo Ballivián. General Ballivián, a 49-year-old Chaco war hero, formed a ten-man military cabinet composed of three generals and seven colonels, and offered assurances that the presidency would be delivered "as soon as possible to him who, by the constitution, has the right to it." The Ballivián régime then proceeded to declare a state of siege, promise that a new presidential election would be held, and arrest a number of opposition leaders. Permission for a group of opposition exiles to return to Bolivia was granted by the Ballivián government on Aug. 24 and on Sept. 3 the administration frustrated a plot to overthrow it. (G. I. B.)

Education. Schools, (1944): rural 1,513, pupils 110,000; elementary 1,740, pupils 144,056; secondary 55, pupils 17,496. There were also several teachers' training colleges and universities at Cochabamba, La Paz, Oruro, Potosí and Sucre.

Agriculture. Maize, barley, wheat, rice and potatoes. Livestock (1948 est.): cattle 3,499,000, sheep 4,195,000, goats 1,910,000, pigs 1,465,000. Principal forest products, rubber and cinchona bark.

Mineral Production. (1950): Tin 31,213 long tons; copper 5,185 short tons; lead 34,396 short tons; zinc 21,572 short tons; silver 6,566,766 fine ounces; antimony 9,679 short tons; crude petroleum about 620,000 bbl.

Foreign Trade. Exports in 1950 were U.S. \$99 million; imports \$41.9 million. Leading customers: U.S. (52%) and U.K. (41%). Leading suppliers U.S. (47%), Argentina, Peru and U.K. Tin accounted for about two-thirds of the exports by value, followed by silver and lead.

Transport and Communications. Railways (1950): 1,608 mi. Roads (1949): 15,420 mi., including 4,008 mi. improved. Motor vehicles (1950): cars 3,727, lorries 8,391, buses 467. Radio receiving sets (1950) about 75,000.

Finance. (Million bolivianos) Budget (1951 est.): revenue 3,058.8, expenditure 4,725.1. Revenue estimates were based on a tin price of \$1.20 per pound and production of 35,000 tons. Public debt (Dec. 31, 1949): 8,272.9, including foreign debt 5,829.3. Currency circulation (Aug. 31, 1951): 3,783. Gold reserve U.S. \$22,800,000. Monetary unit: boliviano with an official exchange rate (Nov. 1951) of U.S. cents 1.65 and a kerb rate of U.S. cents 0.48. (J. W. Mw.)

BOOK COLLECTING AND BOOK SALES.

In 1951, the sale of Sir Leicester Harmsworth's remarkable library reached the 28th portion. His world-famous collection of Americana reached sections I to M. The more important books in that field maintained the high level of 1950.

An interesting sale held in London in March was the remaining portion of the Bridgewater library which included a presentation copy of John Donne's *Pseudo-Martyr*, 1610,

containing a letter from the author presenting the copy to Lord Ellesmere, the founder of the library; this sold for £450 and two works by John Florio, *Second Fruits*, 1591 (a Shakespeare source book), and *A Worlde of Wordes*, 1598, both presentation copies to Lord Ellesmere, sold for £400 and £360 respectively. Molière's *Oeuvres*, 1666, the first collected edition, and two volumes containing first editions of some of Racine's plays both sold for £280. A similar library, but on a much smaller scale, was the Shipdham church library, which was also sold in London during March. A small batch of Americana fetched high prices equalling those realized at the Harmsworth sales. A copy of Milton's *Areopagitica*, 1644, fetched £235 while Erasmus's *Libellus De Conscribendis Epistolis*, printed at Cambridge by the first printer there, John Siberch, in 1521, sold for £460.

The general run of coloured plate books and of coloured flower and bird books showed, if anything, a slight tendency to fall in price, but this could not be said of anything exceptional. A remarkably fine copy of Audubon's *Birds of America*, 1827-38, 4 vols., which was considered to contain the finest ornithological plates ever issued, sold for the record price of £7,000 (in 1945 a copy fetched £3,700). Another famous colour plate book was Edward Orme's *British Field Sports*, 1807-8. This contained 20 superb coloured engravings after Samuel Howitt and had always been considered the most sought-after coloured sporting book. Some copies were issued in ten original parts and these were of extreme rarity. It was not surprising therefore that there was some excitement when a magnificent copy of the part issue in the original wrappers appeared in a London auction in November. It sold for £2,800 and it could safely be said that if the same copy had been sold a few years earlier it would have realized a much higher price. The only other copy in wrappers to be sold at auction fetched £2,600 in 1927. Sporting books on the whole were out of fashion, however, and another copy of the Orme, bound in contemporary morocco, sold for only £500. Apart from coloured plate books, prices of nearly all sorts of books in the London sale rooms rose. This was noticeable in sets of books in fine state and bound in leather, of early printed works and in English books of the late 17th and early 18th centuries—even in theology. Two famous first editions in English literature were Keats's *Poems*, 1817, in original boards, £780, and Burns's *Poems*, Kilmarnock, 1786, in morocco, £750. The works of W. B. Yeats also rose in price and it seemed possible that at last the prophecies of his entry into the first edition market at prices approaching those of other important authors of his time were to be fulfilled.

In New York, the most notable sale was that of Lucius Wilmerding's Continental books. Many fine manuscripts, books and magnificent bindings were included in the sale and most of the prices were greatly in excess of those which Wilmerding had given for them at auction sales in London and New York, mostly in the 1930s. The highest price, \$21,000, was given for the family diary of Montaigne with notes also in the hand of his father, daughter and other members of his family. It was purchased by the French government. (In 1935 it sold for £780 in London.) \$10,600 was given for the *edito princeps* of Richard de Bury's *Philobiblon*, 1473, one of the most famous books about books, and it is worth recording that de Bury said that "no dearness of price ought to hinder a man from the buying of books." A group of five bindings executed for Marcus Fugger were noteworthy and the 18th century and modern French bindings were mostly of lavish design but exquisite taste. A selection of these books had been sent from New York to be exhibited in Geneva, Paris and London before the sale and this undoubtedly roused much interest.

There were few sales of importance of literary manuscripts

or autograph letters during the year apart from the holograph manuscript of Rider Haggard's *Allan Quatermain* (£330) and a remarkable letter of Oliver Goldsmith's concerned with his comedy *She Stoops to Conquer* (£500).

The purchase of the Shuckburgh copy of the famous Gutenberg Bible, 2 vols., by a New York firm of booksellers was a notable achievement. This copy had been lost sight of for about 100 years. Moreover, as £22,000 had been paid in 1947 for the Dyson Perrins copy of the first volume only, there was much speculation about the price paid for the Shuckburgh copy, but this was not disclosed.

In December the E. H. Litchfield library was sold in New York. It contained first editions of most of the famous books collected between World War I and World War II, and it was not surprising to find that the owner had acquired many of the hundred famous books in English literature on the Grolier club list. There were some attractive 16th and 17th century first editions of English literature, noteworthy among which were Holinshed's *Chronicles*, 1577 (\$2,400); the first authorized version of the Bible, 1611 (\$2,200); Burton's *Anatomy of Melancholy*, 1621 (\$1,700); Donne's *Poems*, 1633 (\$800); Herbert's *The Temple*, 1633 (\$950); Herrick's *Hesperides*, 1648 (\$900); Lovelace's *Lucasta*, 1649 (\$1,100); Milton's *Paradise Lost*, 1667 (\$2,300). A surprising price and the highest in the sale was \$3,400 for Raspe's *Baron Munchausen*, 1786.

Two books of major importance were published during the year. Michael Sadleir's *XIX Century Fiction*, a catalogue of his magnificent library, was one of the finest bibliographical catalogues ever issued; it would obviously take its place among works that are accepted as being essential tools in the field. The second volume of Sir Walter Greg's *Bibliography of the English Printed Drama of the Restoration*, was by its research and documentation one of the great bibliographical works of the century.

No account of book collecting in 1951 can be given without a brief acknowledgment to the Festival of Britain exhibition of books organized by the National Book League at the Victoria and Albert Museum from May to September. This effort deserved the highest praise both for its mounting and for the glory of its exhibits. These included some of the finest and rarest books and manuscripts in the country and visitors were able to see a superb copy of the Wycliffe Bible (c. 1430); the wonderful 10th-century manuscript of the Winchester school, the benedictional of St. Aethelwold; the first book printed in English, Caxton's *Historyes of Troye* (Bruges 1475); the first quarto *Hamlet*; and a first folio Shakespeare. Fine as was this exhibition it was perhaps equalled by that opened in Paris in November by T. S. Eliot entitled "Le Livre Anglais." Here English public and private owners and antiquarian booksellers loaned the innumerable treasures which enriched this magnificent collection. It was confined more rigidly to English literature than the Festival exhibition.

The third conference of the International League of Antiquarian Booksellers was held in Brussels. The German association was elected to membership and the number of countries in the league was thereby increased to 12. In England, the Antiquarian Booksellers' association began the first of a series of annual lectures on aspects of book collecting and book selling. The lecturer was Michael Sadleir. (C. D. M.)

BOOK PUBLISHING. During 1951 book publishers in Great Britain produced 18,066 titles, of which 4,938 were reprints and new editions. This total figure, the highest recorded, showed an increase of nearly 1,000 over the 1950 total of 17,072 titles. An increase in output of titles is not viewed by the book trade itself as a reassuring sign unless

it is accompanied by a proportionate increase in the total sale of books, nor were publishers altogether reassured by the steadily mounting turnover figures, since progress here might reflect only the increased prices of books made necessary by rising costs. Lord Justice Birkett, writing as president of the National Book league in a preface to a symposium of book trade experts (*Books Are Essential*, London, Oct. 1951), warned readers against the assumption so easily made, that the book trade's record statistics regarding turnover and output of titles necessarily signified prosperity. "It naturally comes as a shock," he wrote, "to be told that behind all this splendid and imposing front there are said to be problems and difficulties which endanger not only the prosperity, but the stability and even the existence of the book trade as we know it."

The principal reasons for the publishers' concern was the shrinkage in their supplies of raw materials, especially of paper, (due partly to the Anglo-American rearmament programmes) and the rocketing costs of paper, printing and every item of overheads. The publisher's most critical problem, stated the Publishers' association's annual report in April 1951, was the widening disparity between the replacement costs and the original costs of his stock. By economizing in weight of paper, in size of type and in binding, publishers had until 1951 succeeded in holding the production costs of a straightforward book, for example a novel of ordinary length, at little more than double the 1939 figure. In this they had been assisted by the larger editions which an expanding market at home and overseas made possible and consequently the retail prices of books had risen far less than was justified by costs, many books being still only one and a half times their prewar prices. In 1951, however, it became clear that publishers could no longer continue to absorb the large further increases in costs that now overtook them. Moreover, the cost of paper, already, at the beginning of the year, five times its prewar figure, later soared by progressive leaps to the point where the advantage of "the long run," which in modern times had always been the book publisher's basic source of profit, was considerably reduced.

To this generally difficult situation, however, there were two ameliorating factors. One was that books, though dearer, had increased in price proportionately less than any other commodity. The other was that the book-buying public bought the books it favoured in quite unprecedented numbers. The amount of trade done by publishers in 1950 had reached the unprecedented figure of £37,158,652 (the prewar average annual total was approximately £10 million). During the first six months of 1951 publishers' total sales amounted to over £18 million, an increase by nearly £1.5 million on the turnover of the corresponding period of 1950. Since book trade business had invariably been greater in the second half

of the year than in the first, there was little doubt that the 1951 total would surpass the 1950 record. An analysis of publishers' output made by the *Bookseller* showed the average price of books published during the first six months of 1951 to be 12s. 9d. In the preceding six months, July-Dec. 1950, the average price was 12s. 3d. These statistical averages were based on titles only; many of the books most in demand cost much less than 12s. 9d. each. (E. SE.)

United States. During 1951, the number of new books and new editions published in the United States continued to increase, and the total of 11,255 titles was near the record of 11,328 titles published in 1940. There were 233 more titles published in 1951 than in 1950, an increase of 2%. Of the total, imports represented 13%, about the same as the 1950 proportion. Fiction, which was 19% of the year's output, showed a net increase of 228 titles over the previous year. Other categories showing large net increases were philology, domestic economy and medicine and hygiene. Largest net decreases were in technical and military books, fine arts, music and general literature. Pocket books issued in 1951 totalled 972, compared with 940 titles in 1950.

The best-seller list for fiction in 1951 was headed by *From Here to Eternity* by James Jones. A first novel dealing with army life before Pearl Harbour, it sold 240,000 copies. It was closely followed in sales by *The Caine Mutiny*, by Herman Wouk, a story of the navy in World War II. Third to tenth on the list, in that order, were *Moses*, by Sholem Asch; *The Cardinal*, by Henry Morton Robinson; *A Woman Called Fancy*, by Frank Yerby; *The Cruel Sea*, by Nicholas Monsarrat; *Melville Goodwin, U.S.A.*, by John P. Marquand; *Return to Paradise*, by James A. Michener; *The Foundling*, by Francis Cardinal Spellman; and *The Wanderer*, by Mika Waltari. Although two authors, Yerby and Waltari, were represented by other works on the 1950 list, *The Cardinal*, a novel with a religious theme, was the only carry-over.

First on the list of non-fiction best sellers for the year, based on trade sales alone, was *Look Younger, Live Longer*, by Gayelord Hauser. *Betty Crocker's Picture Cook Book* was second.

On July 12, 1951, the Federal Trade commission issued a complaint against the book-club policies of a number of publishers. It was alleged that bookstores did not receive privileges available to the book clubs, giving the clubs an unfair competitive advantage which tended to create a monopoly. Hearings on the complaints began in Oct. 1951. (X.)

BORNEO: see BRITISH BORNEO; INDONESIA.

BOTANICAL GARDENS. After the great influx of seeds from the Himalayas in recent years, 1951 was a year of consolidation in most botanical gardens and many of the collected plants flowered for the first time, particularly those in the genus *Primula*.

A new house was built at the Royal Botanical garden at Kew for West Australian plants and was ready for planting. J. Souster took over the control of the temperate house following the death of C. P. Raffill who had been in charge of it for many years. B. L. Burt left the staff at Kew and took up an appointment in the Edinburgh Botanic garden.

At the Cambridge Botanic garden J. S. L. Gilmour took up his appointment as director. New ground was added to the garden and a start was made with the planting. The Cory bequest also enabled the Cambridge Botanic garden to add a number of rare and notable books to its library.

At the Royal Botanic garden at Edinburgh, a new aquatic house was built. Much replanting was also done in the rhododendron copse, while the old "rootery" was demolished and new peat walls built in its place. J. Macqueen Cowan and

H. Davidian, of the Edinburgh Botanic garden, completed their revision of the large Thomsonii series of the genus *Rhododendron* and this was published in the *Rhododendron Year Book* of the Royal Horticultural society.

At the Royal Horticultural society's gardens at Wisley, Surrey, H. R. Fletcher took up his appointment as director. Dr. Fletcher was formerly at the Edinburgh Botanic garden. The society suffered severe losses in the deaths of G. Fox Wilson, their entomologist, and F. C. Brown, the trials officer, early in the year. V. W. Fowler was appointed as entomologist and J. B. Paton as trials recorder. Many notable plants flowered in the gardens during the year and a number of these were shown in a very large group of plants for a woodland garden staged from the gardens at the Chelsea Flower show. The overhaul of the rock garden at Wisley was continued and this part was a notable feature of the garden in 1951. The long and wet spring suited well the new plantings of rhododendrons and lilies on Battleston hill and these flowered exceptionally well. The new collection of fruit varieties was planted above the model fruit garden. On the scientific side, work continued on the selection and crossing of antirrhinum stocks resistant to rust. In the cytology department, examinations of the genera *Camellia*, *Viburnum*, *Lonicera*, *Narcissus*, *Nerine* and *Buddleia* were made. The first colchicine-induced tetraploid in rhododendron was also produced at Wisley in *Rhododendron Wardii*.

(P. M. S.)

United States. Probably the most important incident that happened during 1951 as far as the arboretums and botanical gardens of the United States were concerned was the founding of the Saratoga Experimental gardens at Saratoga, California. The establishment of such an institution had been a life-long ambition of Ray D. Hartman, one of the leading horticulturists on the Pacific coast and owner of one of the oldest nurseries in western North America, the Leonard Coates nurseries of San Jose, California, who initiated the work resulting in this new arboretum. The site chosen had an elevation of 450 ft. at the base of the Santa Cruz mountains. Maunsell Van Rensselaer, formerly director of the Santa Barbara Botanic garden for 16 years, was chosen as the director, and the garden was officially opened Jan. 1, 1951. For the next few years, emphasis would be placed on the selection and propagation of the best available strains of shade trees and native shrubs. Experimental studies would be carried on in methods and techniques of propagation of superior plant stock on a large scale. (See also HORTICULTURE.)

(D. W.)

BOTANY. In accordance with the general historical theme of the Edinburgh meeting of the British Association, the presidential address to the botany section, by Professor W. Brown, was entitled "Mycology over a century." He reviewed nearly every aspect of this branch of botany during a period which started with the final abandonment of the theory of spontaneous generation and ended with the recent discovery of antibiotics and of the dependence of fungi and bacteria on bios types of substance, and with remarkable recent work on fungal genetics. The historical theme was further emphasized in a symposium of papers on the history of cultivated plants: Sir John Milne Home, "The introduction of conifers and their influence on forestry"; J. M. S. Potter, "The history of the apple"; W. B. Turrill, "The history of cultivated and wild olives"; G. D. H. Bell, "The history of cereals"; and J. G. Hawkes, "The history of the potato."

The International Association of Plant Taxonomists issued the first two numbers of its new periodical *Taxon* (Utrecht). The Association pour l'Étude Taxonomique de la Flore de l'Afrique trppicale (A.E.T.F.A.T.), founded in 1950 at a well-attended meeting at Kew, held its first congress in

Brussels, sponsored by the Université Libre de Bruxelles, under the presidency of Professor L. Hauman. This meeting, attended by over 30 American, Belgian, British, French, German, Italian, Portuguese and Swiss botanists took the form of a symposium of papers covering almost the whole of tropical Africa and Madagascar. These papers were to be published. The first volume of a large-scale project, the *Flora Malesiana*, contained an encyclopaedic account of all known collectors in the Malaysian region, compiled by Mrs. Van Steenis.

A. J. Eames criticized some of the concepts of the so-called "new morphology" and attacked H. J. Lam's classification of the angiosperms into *Stachyosporae* and *Phyllosporae*. P. E. Weatherby, in studying the water relations of the cotton plant, investigated the effect of environmental conditions throughout the season on the water deficits of cotton plants measured as relative turgidity of the leaf tissues. This proved to be independent of the age of the plant and to be controlled by environmental conditions alone. Water deficits at sunrise showed that deficits developed during the day were not entirely made good during the night. W. G. Ball and H. E. Street found that excised tomato roots grown in White's medium showed marked improvement on addition of copper and molybdenum. K. Bhagrat and K. Hill found a complete cytochrome system in various flowering plants, associated with cytochrome oxides and succinic hydrogenase, acting as a respiratory mechanism identical with that characteristic of animals. D. C. Spanner and O. V. S. Heath described modifications to the resistance porometer in order to correct the error due to the flow through the leaf being augmented by

Koenigia islandica (above) and *Diapensia lapponica* (below). These two wild plants were discovered in Skye and in Inverness-shire respectively in 1951.

water vapour, which is removed again by a drying agent before the air passes through the standard capillary, and the error due to the leaf temperature being different from the capillary temperature. G. E. Blackman and G. E. Wren studied differential effects of light intensity on assimilation and growth rate and, as a result of their work, redefined a "shade" plant as one in which a reduction of the light intensity caused a rapid rise in the leaf-area ratio from an initial low value in full daylight, and a "sun" plant as one in which the converse definition held. G. E. Blackman and G. L. Wilson showed that, in ten species studied, the net assimilation rate during the season of active growth was linearly related to the logarithm of the light intensity but that late in the autumn the relationship no longer held. C. L. Mer studied the auxin theory of growth regulation in the mesocotyl of *Avena sativa* and concluded that the auxin itself was not the primary reactant in the perception process and that the growth of the mesocotyl was probably controlled by the coleoptilar node and plumular growing point, rather than by auxin diffusing downward from the tip of the coleoptile. F. R. Whatley made enzyme extracts from green leaves containing an isocitric dehydrogenase resembling that obtained from animals and seeds. D. Doxey and A. Rhodes found that the growth rate of cress was unaffected by hexachlorocyclohexane but growth was significantly reduced in wheat. The effect on mitosis in rye resembled that of colchicine and other mitotic poisons inhibiting spindle action.

P. N. Mehra and Naima Chopra described the stellar anatomy of *Stenochlaena palustris*. The stem was dictyostelic and showed five or six central meristemes in transverse section. G. E. Fogg found that heterocysts in *Anabaena cylindrica* were not the seat of salt accumulation and that resemblance to vacuolation in other plants was only superficial. He suggested that a possible advantage of heterocysts might be that their formation resulted in the release of material that might be used to maintain adjacent cells. L. B. Moore recorded oögamia in five southern species of *Holopteris*. In each of these the gametangia and asexual sporangia occur in similar sori but on separate plants. Plurilocular antheridia and unilocular oögonia occur within the same sorus. In *H. congesta* Miss Moore observed fertilization in cultures.

K. B. Vallance and D. A. Coult found that oxygen contained in the vesicles of *Fucus vesiculosus* might be markedly increased by photosynthesis but that the carbon dioxide content appeared to bear no relationship to metabolic activity. They suggested that vesicle formation might be conditioned by the intensity of photosynthetic activity.

H. M. Canter and J. W. G. Lund studied the interrelation of populations of plankton organisms (diatoms and a blue-green alga) and their chytrid parasites in Windermere and Esthwaite Water and found that the infection might delay the time of maximum algal number or decrease the size of the maximum.

J. E. Lousley edited a report on the 1950 conference of the Botanical Society of the British Isles consisting of a symposium of studies on the distribution of British plants and the best ways of recording these on maps. C. D. Pigott recorded the presence of *Scutellaria hastifolia* in Norfolk.

F. J. Seaver published a comprehensive work on the North American cup fungi containing a systematic account of the *Geoglossaceae*, *Helotiaceae* and *Cenangiaceae* with keys to the tribes, genera and species. A posthumous work by A. H. R. Buller described the sexual process in the rust fungi, including much of his own experimental work. He gave an account of the history and function of the pycnidia and the methods by which the sexual process was initiated. A. F. Parker-Rhodes discussed certain aspects of dissemination of anemophilous basidiomycetes on Skokholm island and defined the mean radius of dissemination, the mean breeding

sample and the circumscription ratio. He explained how, on certain assumptions regarding action of air currents, these quantities could be evaluated by numerical integration. G. C. Ainsworth and K. Sampson gave a general account of the British smut fungi with chapters on biology, cytology and genetics and a discussion of the economic importance of the group.

D. E. Coombe and F. White studied the plant communities on calcareous soils in arctic Norway. P. H. Davis investigated cliff vegetation in the eastern Mediterranean and outlined the plant communities. He concluded that saxatilis was an advanced and specialized character favoured by natural selection and that the development of a saxatile habit in species not normally saxatile occurred at the edge of a species' range and/or under adverse conditions. Species of vertical and overhanging rock were considered to have had the longest saxatile history. J. N. Jennings and J. M. Lambert described alluvial stratigraphy and vegetational succession in the region of the Bure valley (Norfolk) broads. (See also HORTICULTURE.)

BOWLS. In 1951, 2,212 clubs were affiliated to the England Bowling association. There were 51,000 entries from 34 counties for the national championships held at Paddington B.C., Aug. 20-28: A. Pikesley (St. Albans, Hertfordshire) won the singles; South Oxford (R. F. Duke and P. C. Harvey), the pairs; North Oxford, the triples; and Oxford City and County the rinks.

The international tournament for the *News of the World* trophy, played at Swansea, Glamorgan, on July 4-6, was won by Ireland. The England-New Zealand test match at Bellingham, Kent, was stopped by rain after four ends.

The National Welsh B.A. singles was won by A. E. Evans (Abergavenny), the pairs by E. H. Jones and L. C. Williams (Penarth) and the rinks by Cardiff (Ivor Davis, J. Budd, T. King and F. L. Cottle). The Scottish B.A. singles was won by N. Campbell (Stirling Spittalmyre), the pairs by Ayr Wattfield (A. Young and R. Morton) and the rinks by Twechar. The Irish B.A. singles was won by J. Anderson (Coleraine B.C.), the pairs by Coleraine B.C. (J. Anderson and R. Fulton) and the rinks by Forth River B.C. Mrs. Burdon (Kent) won the English Women's B.A. championship.

Northumberland won the Middleton cup, beating Middlesex in the final by 7 shots (128-121). The London and Southern Counties B.A. gold badge was won by A. T. Durrant (Bellingham) and the Lonsdale tournament by H. G. Soar (Lensbury).
(J. W. FR.)

BOXING. The sport cannot be said to have progressed during 1951. Throughout the world the "box fighter" rather than the complete scientific craftsman was in the ascendant, and it was a veteran of 20 years' professional fighting, Joe Walcott, who became world heavyweight champion by knocking out Ezzard Charles, another coloured U.S. boxer, in the seventh round in New York. It was Walcott's fifth bid for the championship.

The need for an international authority to control and regulate world championships became more than ever apparent, and the British and European control boards made strenuous efforts to advance this long overdue reform. During the year the British Boxing Board of Control refused to sanction the introduction of the American "no foul" rule.

Randolph Turpin, the 23-year-old coloured British boxer, provided the fistic sensation of the year when, in London, he outpointed Ray Robinson, America, to win the world middleweight championship. Two months later, however, Robinson regained his title in a return bout in New York when Turpin was adjudged "unfit to continue" in the tenth round. The British heavyweight champion, Jack Gardner, won the European championship by outpointing Joe Weidin, Austria, in March, but subsequently lost this title to Hein Ten Hoff, Germany. On his showing so far it was doubtful if Gardner possessed the qualities needed in a world champion. Two other heavyweights whose progress was watched with interest were Johnny Williams, Rugby, and Ray Wilding, Cheshire.

Don Cockell, London, who shared with Turpin the distinction of being the most improved boxer of 1951, won the European light heavyweight title by beating Albert Yvel, France, and later successfully defended his British crown by beating Albert Finch; but in December he was beaten by Jimmy Slade (U.S.). In the welterweight division, Eddie Thomas, Wales, experienced variegated fortunes. He won the empire title from Pat Patrick in Johannesburg, and then won and lost the European championship. After beating Michele Palermo, Italy, he was defeated by Charles Humez, France. Finally, he forfeited his British title to Wally Thom-

Randolph Turpin (left) in his fight with "Sugar" Ray Robinson for the world middleweight title at Earls Court, London, July 10, 1951. (This photograph was awarded 1st prize in the Sports category of the "British Press Pictures of the Year" competition; see pages 450-51).

Liverpool, when beaten on points in a London fight in October.

The British lightweight title changed hands when Billy Thompson, the holder, was beaten in the first round by Tommy McGovan. Ronnie Clayton, Blackpool, successfully defended his native flyweight title against the veteran Al Phillips, Aldgate, but lost his empire title to Roy Ankarah, the coloured boxer from the Gold Coast, who made up for lack of style by non-stop aggression and was apparently indifferent to punishment. Peter Keenan, Glasgow, won the bantamweight title when he defeated Danny O'Sullivan and later he added further to his reputation by outpointing the Spaniard Luis Romero, to win the European title. The vacant British flyweight title was won by Terry Allen, London, when he outpointed the Scot, Vic Herman. In the amateur field one of the most significant events was the abolition of the "silent count." The standard of skill shown in the Amateur Boxing association championships was well below that of former years. (W. B. Dy.)

United States. Ray Robinson surrendered his world welterweight title when he knocked out Jake La Motta in 13 rounds in Chicago in February, to win the world middleweight title. This abdication produced an elimination series which ended with Kid Gavilan, Cuba, being recognized in the United States as world welterweight champion. His claim was disputed by European boxing authorities, who recognized Charles Humez, French boxer, as world champion.

James Carter, New York City, knocked out Ike Williams, Philadelphia, in 14 rounds of a bout in New York, on May 25, to become world lightweight champion.

Joey Maxim, Cleveland, Ohio (light-heavyweight), Sandy Saddler, New York (featherweight), Vic Toweel, South Africa (bantamweight), and Dado Marino, Honolulu (flyweight), all retained their world titles.

The eclipse of Joe Louis came in October. The 37-year-old former world heavyweight champion, fighting a comeback campaign for another chance at the title he once held, was knocked out in eight spectacular rounds by Rocky Marciano, young Brockton, Massachusetts, heavyweight. (J. P. D.)

BOY SCOUTS. In 1951, scouting in Great Britain showed no diminution either in its attraction for boys or in the quality of its services, and showed even greater technical efficiency. During the year scouts took part in Festival of Britain activities throughout the country. In London the pageant play "Boy Scout" was performed for one week at the Royal Albert hall with its customary success, and a special Exhibition of Exploration was held throughout the summer in R.R.S. "Discovery," Captain R. F. Scott's old ship moored off the Victoria embankment. During the latter part of August, scouts gave special displays daily at the South Bank exhibition. The London scouts organized an international patrol camp during August at Gilwell Park as their contribution to the Festival of Britain, and here patrols from 38 nations came to camp.

Scouts have always tried to pay their own way, and during Easter week every scout in the movement was busy for the third year in succession with "Bob-a-Job" Week, during which each scout tried to earn money for the movement in Great Britain.

The big event of the year for scouts the world over was the Seventh World jamboree, which was held near Bad Ischl, Austria; over 15,000 scouts from 43 nations came to camp for ten days, including 3,000 scouts from Great Britain.

During 1951, the total number of scouts of all ranks in Great Britain was 429,231, and there were 43,343 adult

A view from the roof of the Albert hall, London, during the rehearsal of the musical pageant "Boy Scout," June 1951.

leaders. Among scout groups, 45% were "open" and 55% sponsored (45% by religious bodies, 9% by educational institutions and 1% by hospitals). Over 1,300 scouts received their royal certificate as King's scouts during the year.

(RLN.)

United States. In 1951 about 750 U.S. scouts attended the world jamboree in Bad Ischl, Austria. At a national training conference of professional leaders held at East Lansing, Michigan, Sept. 5-12, a three-year programme was adopted with the slogan, "Forward on Liberty's Team." Civic activities included a "Get Out the Vote" campaign in November. Membership on July 31, 1951, was 2,745,576 men and boys organized in about 76,000 units. The world scout membership was 4,416,306 in 46 countries (1949 census).

BRAZIL. Largest of the Latin American republics, the United States of Brazil has a common frontier with all South American countries except Ecuador and Chile. Area: 3,286,170 sq.mi. (48.3% of the whole of South America). Pop.: (1940 census) 41,236,315; (mid-1950 est.) 52,124,000. The nationality of the population as shown by the 1940 census was: Brazilian-born 39,822,487, naturalized 122,735, foreign 1,283,833, nationality unknown 7,260. Among the foreign-born residents there were c. 354,300 Portuguese, 285,000 Italians, 147,900 Spaniards, 141,600 Japanese, 71,000 Germans, 41,000 Poles and 245,000 citizens of other countries. Among the Brazilian-born population, about half was of European stock; the remainder included 8,744,400 mulattoes (21%), 6,035,700 Negroes (14.6%), 5,500,000 Indians and *mestizos* (13%), and 250,000 Asiatics. Language: Portuguese. Religion: predominantly Roman Catholic (94.4%), with over one million Protestants of various denominations and 110,750 Jews. Capital, coterminous with the federal district: Rio de Janeiro (pop., 1949 est., 2,091,394). Other chief towns (pop., 1940 census): São Paulo (1,253,943); Recife (327,753); Salvador or Bahia (293,278); Pôrto Alegre (262,694); Belo Horizonte (179,770); Belém (166,662); Santos (159,648). Presidents of the republic in 1951: General Eurico Gaspar Dutra and (from Jan. 31) Getulio Dornellas Vargas.

History. The Brazilians gave special attention to economic problems and projects during 1951. On Jan. 31 the newly-elected president, Getulio Vargas, assumed office and announced the names of the new government, which, in accordance with his declared intention of securing national unity, included men of talent chosen from various political parties. Vargas addressed the crowds from the steps of Congress. He warned them not to expect miracles; but he promised equality of opportunity, education and social justice, and assured the workers (to whom he owed his electoral victory) that they would receive a fair share in the results of their labour. He condemned speculators and said that profiteering would not be tolerated. The inauguration of the president was followed by scenes of popular rejoicing.

The important post of minister of finance was given to a highly respected business man, Horacio Lafer, who issued a report on Brazil's financial situation in March. Lafer announced that the new government had inherited a deficit equal to about £131 million, and that paper money in circulation had nearly doubled in the past two years. He stated that he would combat inflation by means of drastic economies and by diverting investment from "luxury" real estate to such essentials as electric power and industry. In their endeavour to improve the country's economy, the government prohibited the importing of goods by barter (this facility had been greatly abused); reduced the expenditure on the SALTE plan* (an ambitious but inadequately co-ordinated five-year development programme drawn up under the previous régime); tried to halt the exodus of workers from the rural districts by promising them better living conditions; and attempted to obtain increased supplies of scarce raw materials from abroad for local industrial requirements. According to official estimates, the cost of living in Rio de Janeiro rose by 18.4% during the first half of the year, but the people felt that an energetic drive to halt inflation was at last being made.

Throughout 1951 the United States continued to show interest in proposals for accelerating the exploitation of Brazil's natural resources, and a joint Brazil-U.S. Economic Development commission was formally inaugurated at Rio de Janeiro in July. The purpose of this commission was to supervise technical and economic co-operation between the two countries under President Truman's Point Four programme. It was stated that projects approved by the commission would be financed by the International Bank for Reconstruction and Development, the Export-Import bank and Brazilian financial agencies. Distribution—including all forms of transport and facilities such as ports, warehouses and marketing systems—was considered to be the commission's first problem, as the full exploitation of valuable resources such as iron ore and manganese was hampered by the inaccessibility of the districts in which they exist. Although the world's supply of rubber originated in the Amazon basin, Brazilian industry was gravely affected in 1951 by a shortage of raw rubber and schemes for the laying out of modern plantations in the north were therefore discussed.

Coffee and cotton were again the principal exports, and although the United States fixed a ceiling price for coffee and the world price of cotton slumped in the course of the year, the sale of these two products enabled Brazil to attain a satisfactory balance of trade.

Early in the year a serious drought afflicted five north-eastern states of the republic. Crowds of thirsty refugees marched through dry deserts caused by six months' lack of rain and entered the towns pleading for food, lodgings and work. Epidemics broke out, cattle died from hunger and thirst, and harvests were dried up by the sun. This tragic

* The word SALTE was coined from the initial letters of the words *Saude* (health), *alimentação*, *transporte* and *energia*.

occurrence reminded the people of Rio de Janeiro and São Paulo of the desperate need for remedying the primitive conditions which still prevailed in vast areas of the interior of their country.

In July a law was passed making racial discrimination a penal offence. Under this new law a refusal by hotels, restaurants and schools to admit coloured people became punishable by imprisonment or fine.

No serious social disturbances took place during 1951, though several Communist plots were denounced in various districts and some Communists were arrested. The employees of the Brazilian airlines went on strike in December and the government was obliged to intervene. (G. P.)

Education. Schools (1948): primary 66,641, pupils 4,745,914; secondary 1,344, pupils 297,508; technical 3,970, pupils 216,954. Institutions of higher education 339, pupils 28,440. Universities: state 8; Catholic 2. Illiteracy (1947): approximately 57%.

Agriculture. Main crops ('000 metric tons, 1949-50; 1950-51 in brackets): coffee 1,158 (1,170); cacao beans 132 (133); sugar, raw value 1,732 (1,730); tobacco 116 (123); cotton, ginned 299 (325); cassava 13,150; maize 6,162; rice, paddy 2,980 (2,995); wheat 438 (519); cottonseed 590 (831); linseed 23 (33); oranges 1,246 (1,003); grapes 226; bananas 2,958; groundnuts 100 (160); nuts (1950; 1951 in brackets) 22.0 (32.3). Livestock ('000 head, Dec. 1948): horses 6,928; cattle 50,178; sheep 13,804; pigs (Dec. 1949) 23,881; asses 1,536; mules 3,097; goats 8,309.

Industry. Industrial establishments (1947 est.) 85,000. Persons employed in manufacturing industries (1947) 1,500,000. Fuel and power: coal ('000 metric tons, 1950; 1951, six months, in brackets) 1,956 (951); consumption of gas in Rio de Janeiro and São Paulo (million cu. m.) 210 (110); consumption of electricity in Rio de Janeiro and São Paulo (million kw.h.) 2,856 (1,426); crude oil ('000 metric tons) 38.4 (42.5). Raw materials ('000 metric tons, 1950; 1951, six months, in brackets): iron ore, exports 890 (490); pig iron 704 (350); crude steel 788 (400); rubber 20.3 (first quarter 1951) 7.0; gold (fine ounces) 131,700. Manufactured goods: cotton piece goods, exports ('000 quintals, 1949; 1950 in brackets) 40.0 (13.5); cement ('000 metric tons, 1950; 1951, six months, in brackets) 1,308 (651).

Foreign Trade. (Million cruzeiros, 1950; 1951, six months, in brackets): imports 20,313 (15,926); exports 24,913 (15,300). Main sources of imports (1950): U.S. 34%; U.K. 12%; Argentina 10%; Belgium-Luxembourg 6%. Main destinations of exports: U.S. 55%; U.K. 8%; Argentina 6%; France 5%. Main imports (1950): machinery and vehicles 42%; petroleum and products 12%; wheat and flour 10%; iron, steel and manufactures 5%. Main exports: coffee beans 64%; raw cotton 8%; cacao beans 6%.

Transport and Communications. Roads (1949): 64,294 mi. Motor vehicles licensed (Dec. 1950): cars 205,000, commercial 204,000. Railways (1950): 22,360 mi.; passengers carried 309 million; freight

carried 34 million tons. Shipping (merchant vessels of 100 gross tons and over, July 1950): 338; gross tonnage 701,278. Air transport (1948): mi. flown 33 million; passenger-mi. 419 million; cargo net ton-mi. 40 million; mail ton-mi. 758,000. Telephone subscribers (1949): 484,300. Wireless licences (1950): 1,600,000.

Finance and Banking. (Million cruzeiros) Budget: (1950-51 actual) revenue 20,550; expenditure, 22,868; (1951-52 est.) surplus 26. Currency circulation (July 1950; July 1951 in brackets): 21,680 (27,050). Gold and foreign exchange (million U.S. dollars, July 1950; July 1951 in brackets): 609 (592). Bank deposits (Dec. 1949; Dec. 1950 in brackets): 32,020 (44,820). Monetary unit: *cruzeiro*, with an exchange rate of Cr.\$ 52.4 to the pound sterling and Cr.\$ 18.72 to the U.S. dollar.

BREAD AND BAKERY PRODUCTS. The quality of bread and bakery products is influenced by many factors but the extraction rate is one of the most important. Before World War II, the miller made, from 100 parts of wheat, some 72 parts of flour, the remainder being coarse offal used for animal feeding. Such flour was designated 72% extraction flour and was, of course, white. During the war, owing to the submarine menace and other factors, the extraction rate was raised to 85% and even higher, which meant that the flour was darker and, from the baker's point of view, was far from ideal. In 1950, the extraction rate was reduced to approximately 80%, but in 1951 there was no further reduction. The controversy as to the nutritive value of short and long extraction flour continued.

The problem that greatly exercised the minds of millers and bakers during 1951 was the desirability of the chemical treatment of flour and, especially, of the use of nitrogen trichloride. Why is flour treated at all? All wheat does not yield flour ideal for the making of bold, well-aerated bread, but it is logical to use all wheats available and to take all possible steps to make the flour as suitable as possible for making bread. Also, it is well known that the baking quality of flour, that is, its ability to make satisfactory and pleasingly bold bread, improves as the flour is stored and aged. Obviously, oxidation has to take place, and the practice in 1951 was to secure this necessary oxidation immediately by such chemical treatment as, for example, the addition to flour of 1 part in 100,000 of potassium bromate. A particularly effective treatment was the use of a trace of nitrogen trichloride. But it was found that, if dogs consumed very large

quantities of bread made from flour so treated, running fits might be induced. The actual toxic substance responsible for this unfortunate state of affairs was identified, by the brilliant work of the Research Association of British Flour Millers, as methionine sulphoximine, which, although it did not affect human beings, raised the whole question of the treatment of food by traces of chemicals. Some pronouncement seemed likely to be made but, whatever the decision might be, it was felt that there was a need for the proper use of certain chemicals in foodstuffs. The use of nitrogen trichloride did not seem likely to be continued after 1951.

Improvement in wheat varieties continued and advances in milling technique occurred on the lines indicated in 1950, especially in connection with pneumatic conveying, which led to increased cleanliness and freedom from insect pests. A new instrument for assessing flour colour accurately attracted considerable attention. Work continued during 1951 towards improving the attractiveness of bread, delaying staleness and, particularly, combining science and art in the bakery. (See also WHEAT.) (D. W. K.-J.)

BREWING AND BEER. In 1951 the price of beer was raised without any increase in the beer duty for the first time in a hundred years. The rise, of a penny a pint on average, was general but not universal and occurred during April, May and June. Certain beers were being retailed at the end of the year at a price no higher than at the beginning. The increase was forced upon the brewing industry by rising production and distribution costs and was later wholly absorbed if not more than offset by increased outgoings. The price of malting barley of the 1951 crop, for example, reached £10 a quarter compared with an average of £7 in 1950. Hops rose in price from £21 to £26 2s. 6d. a hundredweight. Costs of fuel, transport, wages and of repairs and redecoration of licensed houses also rose sharply. In the House of Commons in November, the financial secretary to the Treasury gave the following figures for profits after taxation: 1938-39, £17 million; 1949-50, £15 million. The £15 million represented less than $\frac{1}{2}$ d. a pint profit and even so was in no sense a true net profit. A large proportion of the reserves needed for the future improvement and replacement of licensed houses had to come out of this amount. The brewing industry's check on profit-making had enabled the chancellor of the exchequer to keep the beer duty at an optimum level. The duty for the previous three years had amounted to 8 $\frac{1}{2}$ d. a pint on average, more than two-thirds of the price to the consumer. During the year ended March 31, 1951, it yielded £249,125,000. During the financial year 1951-52 it was expected to yield £237 million.

During the year there was considerable evidence that the decline in beer-drinking was levelling off. Some economists held the view that changing social habits had brought about and would continue to bring about a decline in beer consumption. Relative to population, there had been a fairly steady fall in output during the previous 50 years: 1900, 34,048,977 bulk barrels; 1910, 29,379,311; 1920, 35,047,947; 1930, 25,061,956; 1940, 25,366,782 and 1950, 26,513,997. Consumption per head fell from 28.8 gal. in 1914 to 19.3 in 1950. Many brewers, however, considered that the effect of the high beer duty in driving up the price was underrated as a cause of this decline.

Difficulties facing export brewers did not decrease during 1951. Nevertheless there was an overall increase in exports—from 347,000 standard barrels in 1949 and 348,000 in 1950 to 423,000 (est.) in 1951. Exports to Commonwealth countries increased from 151,000 standard barrels in 1948 and 168,000 in 1950 to 210,000 in 1951.

There was a marked tendency for bottled beer to become more popular. Consumption had gone up by about 4% of the total during the previous two years. In 1949, it was about 30% of the total; in 1951, it was about 34%. For 10 or 12 years, brewers had been unable to install the bottling machinery and to obtain the materials necessary to meet the existing demand for bottled beer. They were now able to make some progress in this respect. The shortage of spare cash to enable a customer to stand his friends a round of drinks in a licensed house, and other causes, meant that people more often took their beer home in bottle.

The government's decision to repeal the clauses of the last licensing act dealing with state management of licensed houses in new towns was hailed with relief by the residents there. The consensus of opinion was that the inns of England, under brewer-ownership, had been preserved, restored and improved with a care and on a scale unprecedented in their history. Under brewer-ownership the inn had been transformed from the sordid drinking shop of the early industrial era into a real social centre where any man could go, taking his wife with him. The system had preserved the customer's freedom of choice of beer and had been a strong safeguard against the monopoly by enabling the smaller brewing firm to compete locally on level terms with the larger organizations. Exaggerated statements about the effect of the "tie" of licensed houses to brewers were disposed of by the Census of Production report, which showed that more beer was purchased from brewing firms by independent buyers than by buyers under the firms' control. (X.)

United States. Beer and ale sales in the United States for the fiscal year ended June 30, 1951, totalled 83,246,162 bbl. (of 31 U.S. gallons each; U.S. gal.=231 cu.in.; British imperial gal.=277.274 cu.in.), the fourth highest amount on record for a fiscal year. The largest sales for a fiscal year were 86,992,795 bbl. in 1948. A National Production authority order reducing the use of cans by brewers was believed to have had a restrictive effect on sales. In the calendar year 1950, beer in cans represented 25% of all packaged beer sold. An increase of \$1 a barrel in the federal excise tax on beer, bringing the new rate to \$9 a barrel, became effective on Nov. 1, 1951. In addition, state taxes averaged more than \$2 a barrel, and in some cases local taxes were also applied.

Beer purchases for army personnel overseas in the first nine months of 1951 amounted to \$10,958,354. Beer was purchased out of non-appropriated funds for sale through servicemen's and officers' clubs and post exchanges (equivalent to N.A.A.F.I.). From Oct. 25, 1950, beer was shipped free to overseas commands by the military sea transport service of the department of defence. Before that, the army exchange service had paid normal freight charges.

The industry's pay roll totalled \$332,931,000 in 1950, covering 81,155 employees. The average number of production workers was 58,054. Purchases of agricultural products were estimated at nearly \$300 million for the year, mainly for malt, corn products, rice and hops.

Federal excise taxes, at \$8 a barrel, and special taxes on malt beverages for the fiscal year 1951 totalled \$669,470,889, bringing the cumulative total since relegalization (April 7, 1933) to \$8,172,163,097. State and local taxes and licence fees in the fiscal year 1951 were estimated at \$215 million, raising the cumulative figure for that revenue to about \$2,730 million. (See also HOPS.) (E. V. L.H.)

BRIDGES. The continuing shortage of steel throughout the world gave reinforced concrete an added attraction as a material for bridge construction but the majority of reinforced concrete bridges built were of the relatively new material, pre-stressed concrete.

In Great Britain, the Neath bypass viaducts in 1951 reached an advanced stage of construction. Of the smaller bridges no less than 11 were of pre-stressed concrete, one at Shrewsbury having a span of 150 ft. The most interesting was the footbridge running from the concert hall terrace to Waterloo bridge gate in the South Bank exhibition, London. This bridge, of four spans, was 284 ft. in length. The cross-section was in the form of a T-beam 11 ft. 10½ in. in total width, with a shallow rib 4 ft. wide and 1 ft. 10 in. thick, the deck being 3 in. thick at its cantilevered edges and only 9½ in. thick where it joined the rib. The supporting columns tapered from 3 ft. 9 in. by 2 ft. 3 in. at the top to 1 ft. 9 in. by 1 ft. 6 in. at the base. To allow the deck to take up its shortening freely under pre-stressing, alternate columns were given temporary hinges at top and bottom.

An aluminium alloy heel trunnion bridge, span 70 ft., width 37 ft., was under construction for Aberdeen harbour. The moving leaves, built entirely of light alloy, folded into the fixed shore structure when in the raised position.

Australia. Construction started on a bridge across the Clyde river, 177 mi. south of Sydney. It consisted of five fixed steel truss spans, each 120 ft. in length, one opening truss span of the vertical lift type, 90 ft. long, and four approach spans of steel plate girders, a total length of 1,008 ft. The lift gave a clearance of 75 ft. above high water level.

A new bridge was under construction on the Pacific highway at Swansea. It had an overall length of 570 ft., comprising twelve 40-ft. rolled-steel joist spans with concrete deck and an electrically operated double-leaf bascule opening span with a steel open-grid deck.

The Hunter river, at Hexham, was crossed by a bridge having six steel truss spans, including a vertical lift span, each 120 ft. long, and thirteen 40-ft. long spans of rolled-steel joists.

A combined road and rail bridge over the Burdekin river was under construction. The total length was 3,580 ft. made up of ten 250-ft. steel truss spans with eight 45-ft. and three 60-ft. spans at each end.

Belgium. A great deal of bridge work was carried out in Belgium. Of the six bridges built across the Albert canal, four were Vierendeel trusses with spans from 66.5 m. to 90 m. In every case the main longitudinal members were riveted but the posts were shop-welded and site-riveted. The other two were a riveted girder bridge, length 101.6 m., of uniform depth resting on three supports, and a reinforced concrete tied arch, span 49 m.

Two considerable bridges were built across the Meuse; one was a slender three-span continuous riveted girder of varying depth and overall length 152.2 m., the other was a three-span tied arch bridge in reinforced concrete with the lower longitudinal members pre-stressed, each span being 46.5 m. long with a rise of 9.2 m.

The Brussels-Ostend motor road was carried across the Lys river on an elegant three-span continuous reinforced-concrete bridge, 105.7 m. overall length and varying depth, 1.03 m. at the centre and 3.62 m. at the piers. Construction was also started on two large pre-stressed concrete girder bridges.

France. Many bridges had been built or reconstructed in France since 1945. Among those put into service during 1951 were two, at Evreux and Bourg, of pre-stressed concrete. Of the seven other railway bridges completed or in course of construction during the year, all but one were of reinforced concrete and four were pre-stressed.

Germany. Two important bridges were opened to traffic during the year, the new suspension bridge at Cologne-Mülheim and the girder bridge at Düsseldorf-Neuss. The former was 485 m. long, the distance between the 47 m. high pylons being 315 m., while the dip of the cables was 35 m. The width of the bridge was 27.2 m., the

17.2 m. roadway carrying two tram tracks. The Düsseldorf bridge, 412 m. long in three spans was the largest all-welded box-girder bridge in Europe. The cross-section, 3 m. deep at the centre of the bridge and 7 m. at the supports, consisted of two boxes connected by means of particularly stiff diaphragms. The roadway of this bridge weighed only one-tenth that of the old bridge it replaced.

Iraq. The Baghdad railway and road bridge across the Tigris was completed. The total length, including viaducts, was 7,190 ft., the main bridge over the river consisting of a number of through-riveted steel spans 1,509 ft. long. The menace of inundation and the low bearing capacity of the subsoil made the lightest form of construction desirable; both road and railway viaducts were therefore built of steel bents with stringers. The superstructure of the river spans consisted of three cantilever and anchor arm spans with four suspended spans. All main trusses, railway stringers, cross-girders and deck systems were constructed of high-tensile steel, top laterals, portals and subsidiary details being in mild steel. The suspended spans were fabricated normally, but the cantilever and anchor span trusses were pre-stressed during erection to eliminate the secondary bending effects of dead load and maximum non-reversible live-load stresses.

Netherlands. An all-welded steel bascule bridge was built at Rotterdam, span 14 m., width 12 m. It had a new type of operating machinery resting on the counterweight, which was pivoted in the heel ends of the main girders.

The 300-yd.-long "peace bridge" over the River Main at Frankfurt seen after its opening early in 1951.

Norway. Among the highway bridges completed was the Vormsund bridge, 7.5 m. wide and 266 m. long. It had 14 spans of pre-stressed concrete beams. The Egerøy bridge, also of pre-stressed concrete, was 260 m. long over nine spans. The bridge at Flekkefjord, 40.5 m. long, had two equal side-spans of reinforced concrete. The middle span, 12.5 m., had a timber deck resting on steel girders and rolled in on top of the side span to allow a ship to pass. Two larger bridges, a steel arch across the Firth of Karmsund and a suspension bridge across the Topdalsfjord were being designed.

Portugal. Good progress was made with the Vila Franca bridge over the Tagus, which was ordered on March 26, 1949, and completed in Dec. 1951. The total length, including viaducts, was 1,224 m., five steel arches spanning the 520-m.-wide river. A reinforced concrete bridge of span 115 m. was constructed over the River Sousa.

Switzerland. The Tannwald bridge at Olten replaced a 95-year-old iron three-span arch bridge. The old abutments and piers were used and a new continuous girder bridge combined with a reinforced concrete deck slab was built over them. The three-span steel structure was completely welded. The upper flange of each girder carried a longitudinal serrated plate to which transverse plates were welded to take up the shear from the deck slab. To reduce the tensile stresses in the slab it was pre-stressed by lowering the intermediate supports by 10 cm. two months after pouring.

A beautiful reinforced concrete arch bridge carrying the Bulle-Boltigen road, 8.4 m. wide overall, at a height of 59 m. across the River Javroz was completed early in the year. The total length of the bridge was 169 m., made up of three approach spans on one side of the river and four on the other, the arch having a span of 86.6 m. and a rise of 25.3 m. Each of the two arch ribs had a depth of 1.30 m. at the crown and 2.15 m. at the springings. (J. F. B.)

United States. The Delaware Memorial bridge over the Delaware river near Wilmington, Delaware, completed in 1951, was the world's sixth longest suspension bridge, with a main span of 2,150 ft.

The Chesapeake Bay bridge, just north of Annapolis, Maryland, constructed in 1950-52 at a cost of \$42,600,000, was 21,286 ft. long, including a 1,600-ft. suspension span, a 780-ft. through cantilever truss and a long series of deck cantilever trusses. The George P. Coleman Memorial bridge over the York river at Yorktown, Virginia, constructed in 1950-52 at a cost of \$8 million was featured by two 500-ft. swing spans in tandem to provide, in combination, a channel of 450-ft. horizontal clearance.

Construction was started in 1951 on the \$21 million Tampa Bay bridge in Florida, and on the \$6 million highway bridge across Bay St. Louis on the Gulf coast of Mississippi.

The \$12 million Penrose avenue bridge across the lower Schuylkill river in south Philadelphia, completed in 1951, had a 680-ft. main span of arched cantilever type.

A large concrete bridge with arch spans of 230, 319 and 230 ft. was built in 1951 to carry the Colorado freeway across the Arroyo Seco at Pasadena, California.

A \$2,600,000 bridge was constructed in 1950-51 between Squantum and Long Island in Boston harbour. The 250-ft. centre span was assembled on two barges about four miles away, towed to position and then lowered into place with the ebb tide.

A pedestrian bridge over the Harlem river in New York city, erected in 1951, had a plate-girder lift span of 312 ft. New U.S. records for plate girder spans were set by two bridges (1951) on the New Jersey turnpike crossing the Passaic river and the Hackensack river, respectively, with girder spans of 375 ft.

The second pre-stressed concrete bridge to be completed in the U.S., the Walnut Lane bridge in Philadelphia, Pennsylvania,

was completed early in 1951. The concrete deck was carried on thirteen 160-ft. main span precast girders and fourteen 74-ft. precast girders on the side spans. California's first pre-stressed concrete bridge was a 110-ft. span pedestrian crossing over the Arroyo Seco, in Los Angeles.

Construction was begun in 1951 on a new four-track vertical lift bridge for the New York Central railroad to span the Harlem river in New York city. The estimated cost was \$10 million, and completion was scheduled for 1954. A bridge 3,050 ft. long, made up of 25 deck plate-girder spans 122 ft. long, was built over dry land near Whitney, Texas, to carry the Missouri-Kansas-Texas railroad across a future lake to be formed by the Whitney dam and reservoir.

Brazil. A combined railway and highway bridge over the São Francisco river between Propriá and Colegio, built in 1951-52 by the National Railway Department of Brazil, had a total length of 4,500 ft. The estimated cost was \$6,150,000. Thirty-three concrete piers carried ten steel girders of the Wichert type, each continuous over three spans of 120, 164 and 120 ft. and four simple girder spans of 110 ft. (D. B. S.)

BRITISH ARMY. For the army 1951 was a year of strengthening of the reserves in order that a fully effective field force of completed units, familiar with the most up-to-date arms and supplied with all necessary services, should be ready, on the outbreak of war, to go into action with the

A cartoon entitled "If I were you I'd go and call the R.S.M. a rude name—he'll give you fifteen days inside and probably a disabled soldier's pension" by Giles, in the "Daily Express" (London) on Feb. 1, 1951.

The Z reserve formed a pool of between 2 million and 3 million trained soldiers. In February, in view of the existing circumstances, it was announced that during the spring, summer and autumn 200,000 Z reservists would be called up for 15 days' training with the units and in the services where they would be required to serve in war. Men were not chosen on considerations of age, length of service or date of discharge, but according to their individual qualifications and their ability to meet the more pressing special needs of the army. The call up was successful beyond all expectations and the vast majority of the Z reservists quickly showed themselves willing, efficient soldiers capable of adapting themselves to new military techniques and equipment. In 1952, 250,000 Z reservists were to be called up for 15 days' training.

The active army continued to expand slowly in numbers and to make more rapid progress in equipment. The Territorial army began in earnest the expansion which, it was estimated, would give it by 1954 a strength of between 400,000 and 500,000. This would be the regular influx from the active army each month of about 10,000 national servicemen, who, having completed their two years' full-time

training, were passing on to serve their three-and-a-half years' part-time obligation in the T.A. After a delay due to the extension of the full-time term to two years, the flow reached full volume in April. The volunteer element in the T.A. was 73,000 at the end of the year.

The strength of the active army was maintained at over 400,000 officers and men, half of them regulars and half national servicemen. Recruiting for the regulars was disappointing. It continued at a figure sufficient to supply the normal wastage from a force of 200,000 to 250,000, but did not raise it appreciably towards the 500,000 that was required to justify even a thought of abandoning compulsory service. In mid-1950 the monthly recruitment was only about 3,500. Substantial pay increases were granted in September of that year and the immediate response carried the monthly rate to 7,000; but the improvement was not maintained throughout 1951. In order to apply a new stimulus a new form of engagement was introduced in Nov. 1951. Late in the year recruits began to be accepted for three years' full-time service followed by four years in the reserve. By December the commands were reporting good results. Three years' service meant that a youth liable to national service call-up would do full-time duty for one year more (if he chose, beginning his service at 17½ instead of waiting to be conscripted at 18½) and in return would gain the immediate advantage of the new pay rates (7s. a day as a private against 4s.); the national serviceman had to complete 18 months of his two years before he advanced from the old rate to the new. In addition, the three-year regular was not required to put in three-and-a-half years in the T.A. His four years' reserve liability might be more onerous in times of military difficulty falling short of war but was unlikely in normal times to go beyond a formality.

Overseas the army garrisons were increased. By the winter the British Army of the Rhine had been given two new divisions, the 11th Armoured constituted in Germany from elements sent out from the United Kingdom, and the 6th Armoured, formed in the U.K. and transferred to Europe after taking part in the large-scale autumn manoeuvres at home. These, added to the 2nd Infantry and the 7th Armoured

already in Germany, raised the B.A.O.R. to its promised strength. Answering the darkening threats in Egypt, the 16th Parachute brigade was despatched in June from Aldershot to Cyprus, whence it was flown, four months later, to the Suez canal. In the canal zone it served side by side with the concentrated 1st Infantry division, previously scattered over the middle east. In the far east a Commonwealth division continued to serve in the United Nations army. Commanded by a British officer, Major General A. J. K. Cassels, it comprised the 28th brigade (King's Own Scottish Borderers, King's Own Shropshire Light infantry and 1st Australian regiment), the 29th brigade (Welch regiment, Royal Norfolks, Leicesters and the 5th Dragoon Guards) and the 25th Canadian brigade. The divisional troops included Royal New Zealand artillery. At the end of the year the Gloucestershire regiment, who had won world-fame by their repulse of prolonged, repeated attacks by immensely more numerous Communist forces in Korea, returned to England to receive an enthusiastic welcome. In the 18 months to Dec. 31, British army casualties in Korea were: 400 killed or died of wounds, 1,317 wounded, 201 missing and 916 prisoners of war. (See also *ARMIES OF THE WORLD; MUNITIONS OF WAR.*) (H. W. LE. P.)

BRITISH BORNEO. Colonies of North Borneo (incl. island of Labuan) and Sarawak, and the protected state of Brunei. Areas: North Borneo, 29,387 sq.mi.; Sarawak c. 50,000 sq.mi.; Brunei 2,226 sq.mi. Pop.: North Borneo (1949 est.) 345,000, incl. 66,000 Chinese; Sarawak (1947 census) 546,385, incl. 691 Europeans and 145,158 Chinese; Brunei (1947 census) 40,657. Language: various, Malay serving as a *lingua franca*. Religion: Moslem and pagan. *Administration.* North Borneo: governor; executive council, 3 *ex-officio* and 6 nominated members; legislative council, 3 *ex-officio* and 19 nominated members. Sarawak: governor; supreme council; Council *Negri* (legislature). Brunei: sultan-in-council; general administration, other than matters affecting the Moslem religion, is conducted by the British resident. Governors: North Borneo, Sir Ralph Hone; Sarawak, A. F. Abell (also high commissioner for Brunei).

Infantry and armour in action in Oct. 1951 during exercise " Surprise Packet," the largest army manoeuvres ever held in Britain.

History. In Sarawak in February the secessionists agreed to abandon their activities in the face of the Communist threat to Asia, and Clement Attlee, the British prime minister, renewed assurances of the British government's policy of helping the people towards self-government. There were no disturbances in 1951. On May 31, the new sultan of Brunei, Omar Ali Said-Uddin, was crowned with full ceremony and much rejoicing. Both in Sarawak and North Borneo the soaring prices for raw materials ensured another prosperous year. Indeed, Sarawak proposed to carry out the whole of its £4,500,000 development plan from its oil revenues, and in North Borneo the favourable balance of trade, which had risen from £500,000 in 1949 to £5 million in 1950, continued to improve. A North Borneo development plan was to cost over £5 million, some of which was to be paid for under the Colombo plan (*q.v.*). Its progress was, however, much hampered by shortage of materials and labour; the problems concerning the encouragement of immigration had not been solved, though several hundred people had been brought in from the Cocos and Keeling islands. A contingent of Dyaks from North Borneo continued to do valuable service in Malaya in helping the troops to track down bandits in the jungle.

Education. Primary school attendance 1950, secondary attendance in brackets: North Borneo 19,140 (484); Sarawak 41,000 (8); Brunei 4,496.

Budget (1951 est.):	Currency: Malayan dollar (\$=2s. 4d.).		
	North Borneo	Sarawak	Brunei
	(in millions of dollars)		
Revenue	17.3*	20.1	26.1
Expenditure	11.2*	19.1	10.9
Imports (1950)	46	52.5†	20.5
Exports (1950)	92	50†	60.3

* Excl. development: revenue \$11.4 million; expenditure \$18.1 million. † 1949.

Principal production figures (1950): North Borneo, rubber (23,900 tons); rice (25,000 tons); copra (32,337 tons); Sarawak, crude oil (56,601 tons), refined petroleum (1,854,615 tons), rubber (55,765 tons), timber (36,607 tons in 1949); Brunei, crude oil (4,051,009 tons), rubber (2,496 tons).

(K. G. B.)

BRITISH COUNCIL. At the end of 1951 the British Council was represented in 36 foreign countries; in Australia, New Zealand, India, Pakistan and Ceylon; and in 18 British colonies. The council supplied material and services to the United States, Canada, South Africa and other countries in which it was not directly represented. In the United Kingdom it provided services for people from overseas through 20 offices and centres and 5 student residences. During the year it started work in Siam and withdrew from Aden and Ethiopia.

Funds voted by parliament for the financial year 1951-52, after allowing for estimated receipts of £380,400, totalled £2,730,100, made up of £1,862,000 for work in foreign countries, £345,000 for work in the self-governing countries of the Commonwealth, £443,000 for work in the colonies and £80,100 for services for colonial students.

The council continued to act as the principal agent of the British government in the operation of cultural conventions between Great Britain and other countries. Its chairman, Sir Ronald Adam, was elected a vice-chairman of the executive board of U.N.E.S.C.O. and the council was represented on the cultural committees of the Brussels treaty powers and of the Council of Europe.

For the year 1951-52 the council awarded 195 scholarships for study in the United Kingdom to graduates from overseas, including the first of such scholarships for Japanese, and through the council, 15 overseas countries awarded 60 scholarships to British students.

The annual report of the council, issued in September, recorded that during the year to March 31, it arranged the studies in the United Kingdom of 3,396 people from overseas; sent 130 British experts on 209 lecture tours in 54 countries;

arranged 44 university interchange visits in the Commonwealth scheme and 28 in the foreign scheme, 81 tours of books, fine arts and other exhibitions and 22 theatre and music tours, including those of Old Vic companies in four European countries, the Shakespeare Memorial Theatre company in Germany, the Sadler's Wells ballet in Canada and the Hallé orchestra in Portugal. The council sent 2,486 prints of educational and documentary films to 64 countries and sponsored the recording of the first two volumes of an anthology of English church music. Exchanges of scientific and learned journals between the United Kingdom and other countries reached a total of 3,349. Services to colonial and other students from overseas included meeting 2,261 on arrival, accommodating 355 in council residences and finding other accommodation for 2,365, social and cultural activities in council centres for 6,441 and vacation and weekend courses and short study visits for 7,996. (R. F. AM.)

BRITISH EAST AFRICA: *see* KENYA; SOMALILAND, BRITISH; TANGANYIKA; UGANDA; ZANZIBAR.

BRITISH EMPIRE: *see* COMMONWEALTH OF NATIONS.

BRITISH GUIANA. British colony on the northeast of the continent of South America between Venezuela, Brazil and Surinam. Area: c. 83,000 sq.mi. Pop.: (1946 census) 369,678, excl. c. 6,000 Amerindians in remote districts; (1950 est.) 425,156. Language: English; various East Indian languages also spoken. Religion: 60% Christian, various denominations; non-Christians mainly Hindu or Moslem. Principal towns (pop., 1950 est.): Georgetown (cap., 84,794); New Amsterdam (11,812). Administration: governor; executive council, 3 *ex-officio* and 5 unofficial members; legislative council, 3 *ex-officio*, 7 nominated unofficial and 14 elected members. Governor, Sir Charles Woolley.

History. The year 1951 was one of progress in several respects and confidence in the colony's future was reflected in the successful floating of a £2 million loan in London. A mission from the Colonial Development corporation spent three months investigating the possibility of developing the rice industry, which in any case was stimulated by an arbitration award on the prices to be paid for rice by other British Caribbean colonies. Sugar production was maintained and the bauxite industry completed large capital works. Legislation to assist the starting of new industries by relief from import duties and income tax came into effect. Evidence of further social progress was found in the opening of the new Queen's college which provided secondary education for 500 boys and in the inauguration of the portable water supply scheme for Georgetown.

A commission on constitutional development headed by Sir John Waddington recommended the introduction of full adult suffrage. Other proposals, which were accepted in principle by the secretary of state for the colonies, provided for a court of policy (formerly executive council) consisting of the governor, 3 *ex-officio*, 5 or possibly 6 ministers from house of assembly, and a minister without portfolio from state council; a house of assembly consisting of 3 *ex-officio*, 24 elected members and a speaker; and a state council of 6 nominated members, drawn equally from the three counties, and 3 appointed on the recommendation of the majority and the minority in the house of assembly.

Education. Pupils in elementary schools (1950), 74,153; expenditure on elementary education \$2,125,128.

Finance and Trade. Currency: British Caribbean dollar (\$4.80=£1). Budget (1951 est.): revenue \$24,311,822; expenditure \$24,224,018 excl. colonial development funds. Foreign trade (1950): imports \$55,057,592; exports, incl. re-exports, \$50,254,942. Principal exports: sugar, bauxite, rum, rice, diamonds, timber, balata.¹ Production: Sugar crop (1951) 205,688 tons; bauxite (1950) 1,583,417 tons. (P. H.-M.)

BRITISH HONDURAS. British colony in central America bounded by Mexico and Guatemala. Area: 8,867 sq.mi. Pop.: (1946 census) 59,220; (1950 est.) 67,000. Language: English; Spanish and Indian dialects. Religion: mainly Roman Catholic. Chief towns (pop., 1946): Belize (cap., 21,886), Stann Creek (3,414). Administration: governor; executive council, 3 *ex-officio* and not more than 5 unofficial members; legislative council, 2 *ex-officio* and 10 unofficial members. Governor, Sir Ronald Garvey.

History. The development programme continued to make considerable strides. In April, the first export of 12,000 stems of bananas was made to the United States and Canada, from the plantation established by the Colonial Development corporation in the Stann Creek district. In October, 8,300 stems were shipped to the United Kingdom. Progress was made with the ramie fibre project in the western district. Exports of timber, citrus fruit and chicle all increased substantially. These developments were materially helped by the continuing effects of devaluation of the British Honduras dollar in Dec. 1949, though protests against that measure continued to form part of the platform of the People's United party throughout 1951.

Grants under the Colonial Development and Welfare acts continued on an increasing scale, and special attention was paid to the construction of feeder roads to open up new territory for smallholders. Progress was made on the road from Roaring Creek to Middlesex which was to give land communication between north and south.

A major political issue discussed was whether the colony should join in any federation of the British Caribbean colonies such as that recommended in the report of the standing closer association committee which had been published in March, 1950. The People's United party conducted a strong campaign against federation.

Education. Schools: 92 primary and 5 secondary schools (65 controlled by the Jesuit mission). Attendance: primary schools, 13,526; secondary, 672.

Finance and Trade. Currency: British Honduras dollar (\$4 = £1). Budget (1951 est.): revenue \$4,712,699; expenditure \$4,612,699. Foreign trade (1950): imports \$8,076,417; exports \$4,594,936. Principal exports: timber, coconuts, chicle and grapefruit. (P. H.-M.)

BRITISH LEGION: *see* EX-SERVICEMEN'S ORGANIZATIONS.

BRITISH SOMALILAND. Protectorate in east Africa bounded N. by the Gulf of Aden and French Somaliland, W. and S. by Ethiopia and E. by Italian Somaliland. Area: c. 68,000 sq.mi. Pop.: (1937 est.) 344,700; (1951 est.) 500,000; Somali nomads of ancient Hamitic stock with infusion of Arab blood. Language: includes many Arabic words; script is a variant of Arabic. Religion: Moslem. Capital, Berbera. Administration by a governor. Governor, Sir Gerald Reece.

History. The partial famine, due to drought, in 1950 was not repeated in 1951, when the rains were good and extensive measures taken against locusts were effective; the protectorate was assured of adequate food and grazing. The initial opposition of the people to the setting up of local authorities and district councils in the tribal areas disappeared and the native authority system was successfully established. Of even greater importance was the arrival of an irrigation expert in October to carry out a survey for large-scale irrigation. On the coast of the Red sea hopeful experiments were started in growing dates.

Education. Primary school attendance (1950) 2,000; intermediate 300.

Finance and Trade. Currency: Indian rupee and East African shilling; (from April 1951) East African shilling (20s. = £1). Budget: (1951 est.) revenue £1,200,000 (incl. £616,000 grant-in-aid); expenditure £1,200,000. Foreign trade: imports (1950) £1,200,000; exports £732,000. Principal exports: hides, skins, gums, livestock and ghee. Livestock: camels 2 million, sheep and goats 10 million and cattle 400,000. (K. G. B.)

BRITISH SOUTH AFRICAN PROTECTORATES. Basutoland, Bechuanaland protectorate and the protectorate of Swaziland, generally referred to as the High Commission Territories in South Africa.

	Area (sq.mi.)	Population (1946 census)	Capital
Basutoland	11,716	556,390	Maseru
Bechuanaland	c. 275,000	294,020	Mafeking
Swaziland	6,704	184,473	Mbabane

Administration: high commissioner (who is also high commissioner for the United Kingdom in the Union of South Africa) responsible to the secretary of state for commonwealth relations; resident commissioners. High commissioners (1951) Sir Evelyn Baring and (from Oct. 2) Sir John Le Rougetel. Resident commissioners: (Basutoland) E. P. Arrowsmith; (Bechuanaland) E. B. Beetham; (Swaziland) D. L. Morgan.

History. Patrick Gordon Walker, secretary of state for commonwealth relations, visited the territories in Feb. 1951. He met chiefs and other notables and addressed representative gatherings.

Basutoland. The report (Cmd. 8209) was published of the special commissioner, G. I. Jones, who inquired into the increase in "medicine" murders. He found that the primary cause was the Basuto belief in the medicinal efficacy of human flesh. The revival of this belief was attributed to changes in chieftainship which had adversely affected the status and security of men in authority. The report recommended *inter alia* closer association of the Basuto people with the work of government and reforms in the system of native administration. These proposals were accepted by the secretary of state. After an inquiry into the working of native courts, steps were taken to improve their procedure and to record native law and custom.

The national council resolved to raise funds by a special levy for the further education of Basuto threatened with exclusion from institutions in the Union of South Africa.

Ma' Ntsebo, the regent, accompanied by advisers, paid her first visit to London from Oct. 11 to Nov. 11. She saw Gordon Walker and Lord Ismay who succeeded him and sought a declaration that Basutoland would never be handed over to the Union of South Africa without the consent of the Basuto; but neither minister was prepared to go beyond earlier assurances of prior consultation.

Bechuanaland. The Bamangwato tribe was disturbed by the effects of the banishment of its two leading figures, Tshekedi Khama (*q.v.*) and Seretse Khama, following the latter's marriage to a white woman. Tshekedi's desire to return led to debates, in June, in both houses of parliament at Westminster, and to the despatch from Britain of three observers to report on the attitude of the tribe to Tshekedi's return. The observers found that there was an overwhelming majority opposed to return but the Conservative government announced on Dec. 6 that it was their intention to allow Tshekedi to return ultimately to live as a private person in the reserve. It was later stated that he would be permitted, in the first place, to enter the reserve for short periods to look after his private affairs and that these periods should gradually be lengthened.

The Colonial Development corporation initiated a large-scale project to raise cattle and to slaughter them for export at a central abattoir at Lobatsi, and extensive ranches were leased.

Swaziland. Legislation provided a firmer legal basis for the system of indirect rule in native administration on the lines already adopted in other British dependencies. The paramount chief and his council were recognized as the native authority with power to run a series of native courts.

Tribesmen of the Bamangwato at a kgotla (tribal gathering) at Serowe, Feb. 1, 1951, when they were addressed by Patrick Gordon-Walker, secretary of state for commonwealth relations.

A national treasury, financed from local revenue, was established under the general control of the native authority. These laws marked a new stage in local self-government reached after years of consultation with the tribal leaders.

The African demand for primary and secondary education continued to grow. An increasing number of children were enrolled and new buildings erected, including a new European school. Plans for further development were under consideration. Extensions of medical facilities cost £71,000. A leper survey, involving the examination of 31,000 persons, was conducted with satisfactory results. (J. LN.)

Education. Schools, with the numbers attending in brackets, were in 1950:

	Primary	Secondary and post-primary	European
Basutoland . . .	899 (88,236)	10 (1,012)	6 (116)
Bechuanaland . . .	152 (16,346)	1 (34)	9 (224)
Swaziland . . .	194 (13,588)	13* (670)	7 (568)

* Incl. 4 schools for coloured (mixed race) community.

A small private university from which students took external degrees of the University of South Africa was maintained by the Roman Catholic mission at Roma, Basutoland.

Finance and Trade. Currency: South African pound (£SA1=£1 sterling).

	Budget est., 1951-52*		Foreign trade, 1950†	
	Revenue	Expenditure	Imports	Exports
Basutoland . . .	£938,921	£977,624	£2,555,614	£2,588,120
Bechuanaland . . .	505,293	559,120	1,487,147	1,626,014
Swaziland . . .	529,120	518,588	1,090,793	2,144,851

* Excl. Colonial Development fund expenditure estimated at: Basutoland £107,397; Bechuanaland £155,239; and Swaziland £144,797. Deficits met from accumulated surpluses.

† Excl. earnings of labourers remitted from neighbouring territories for which no estimate available; the total was believed to be considerable.

Principal exports: (Basutoland) livestock, grain, wool, hides and skins; (Bechuanaland) beans, dairy produce, livestock, hides and skins, gold; (Swaziland) livestock, tobacco, asbestos (32,667 short tons in 1950), gold, groundnuts, tung oil.

BRITISH WEST AFRICA: *see* GAMBIA; GOLD COAST; NIGERIA; SIERRA LEONE.

BRITISH WEST INDIES. Under this heading are treated matters of common concern to the island colonies of Jamaica, the Leeward Islands, the four Windward Island colonies (Grenada, St. Vincent, St. Lucia and Dominica), Trinidad and Tobago, and Barbados, and the mainland colonies of British Guiana and British Honduras. Total area 106,172 sq.mi.; population c. 3,025,000. (*See also* articles on the individual colonies and CARIBBEAN COMMISSION.)

Politically, 1951 was of much interest. In the four Windward colonies and in Barbados elections were held under new constitutions which, among other innovations, provided for full adult suffrage. Similar constitutions were due to come into operation in the Leeward Islands, though the necessary legislation to enable elections to be held had not been completed by the end of the year. Wide changes, including the introduction of full adult suffrage, were recommended by the report of a committee on the constitution of British Guiana. In most instances, where elections were held under extended franchises, the trend was towards the return of candidates without previous experience in such bodies.

The possibility of the establishment of a federal government for all the colonies, as recommended by the Standing Closer Association committee set up in 1947, continued to be widely canvassed. The Jamaican legislature set up a committee to study the question and there were other developments which seemed to point in the general direction of federation. The Development and Welfare Organization in the West Indies (comptroller, Sir George Seel) with its headquarters in Barbados, continued to advise on long-term programmes of social reform.

The first meeting of the regional economic committee was held in Barbados in May, and it was decided to set up a West Indian Trade Commissioner's office in Britain. The paper money of a unified currency for the eastern group of colonies (excl. Jamaica and British Honduras) based on the West Indian dollar (sterling equivalent, 4s. 2d.) came into circulation, to the great convenience of the tourist and the general benefit of commerce. Coinage in the new denominations was not expected to be available for about two years. West Indian delegations visited Britain and Canada to discuss economic and commercial problems.

The disastrous hurricane of Aug. 17 in Jamaica (*q.v.*) brought instant expressions of sympathy and practical help from every other British colony in the Caribbean; and the essential unity of the area was again demonstrated at the end of the year when West Indians of all classes from every colony followed the broadcasts that told of the progress of their cricket team on its tour in Australia. (P. H.-M.)

BROADCASTING. The total radio audience in Europe continued to grow at approximately the rate established over the 1946-50 period, when there was an increase of about 40% in European set ownership. The situation varied considerably, however, in different areas. In such countries as Finland, Norway and Greece the number of radio-owning families went up because of increased domestic production, or increased imports, of sets. In Great Britain, Denmark and Sweden, where 90% or more of homes had radio sets, the situation remained stable. In the U.S.S.R. and eastern European countries there was a great increase in listening, though largely confined to domestic services on medium wave or through wired wireless. International broadcasting increased throughout Europe. Of the major contestants, only the B.B.C. European service was reduced.

Great Britain. 1951 proved a stormy year for British broadcasting. The report of the Beveridge committee,

published in January, recommended that the B.B.C. should remain responsible for all British broadcasting, including television. It was proposed (1) that the government, not the B.B.C., appoint broadcasting commissions for Scotland, Wales and Northern Ireland; (2) that there be greater decentralization of the external services and of television; (3) that the government reserve the power to license public authorities or others to run local stations on V.H.F.; (4) that the corporation set up a public representation service; (5) that the activities of the B.B.C. be reviewed every five years by a government committee; (6) that the existing licence fee system continue, the B.B.C. receiving 100% of the net revenue; and (7) that there should be no introduction of advertising. Three members of the committee thought, however, that a public service could have a limited advertisement period without sacrificing its standards. One member argued against the continuance of the B.B.C. monopoly; in addition to a public service financed by licence fee, he wished to see national and local programmes financed by advertising.

In a white paper, published in July, the government proposed that the charter and licence be renewed subject to a number of modifications, notably that regional broadcasting councils be formed, their members drawn from county and urban councils, with responsibility for the appointment of local staff; and that the B.B.C. should receive only 85% of the net licence revenue for the next three years. No decision was reached, however, before the general election in October. The Conservative government therefore announced that the existing charter (due to expire at the end of 1951) should be renewed for six months to allow time for reconsideration. In the meantime the B.B.C. would receive only 85% of net licence revenue.

The external services of the B.B.C. were reduced as a result of a cut in the Treasury grant in April. The cuts fell mainly on the services to countries outside Europe, and the general overseas service was reduced by three hours daily. The external services maintained broadcasts, however, for 85 hr. a day in a total of 45 languages.

Severe interference with the reception of the British domestic services resulted from the Copenhagen plan of 1950, re-allotting medium wavelengths. Steps were taken to assist listeners in the areas most seriously affected by erecting a number of low-power transmitters, several of which were in service by the end of 1951. A plan for a nation-wide service on very high frequencies was submitted by the B.B.C. to the General Post Office. Improvement in the reception of the Light programme was effected when the power of the long-wave transmitter (1,500 m.) at Droitwich was increased to 400 kw. Third programme coverage was improved by the opening, in April, of a new high-power transmitter at Daventry on a wavelength of 464 m., with a total output power of 200 kw. In order to conform to the Copenhagen plan, however, the actual power used was limited to 150 kw.

The Festival of Britain played a large part in B.B.C. programmes. The Home service presented a special series of plays and symphony concerts as a contribution to Festival year. Outside broadcasts gave extensive coverage to the festival and (with C.B.C.) to the royal tour of Canada. The Reith lectures, on "Power and the State," were given by Lord Radcliffe of Werneth. Bertrand Russell gave six weekly talks on "Living in an Atomic Age." In the Light programme the highlight was the "Festival of Variety" on May 6. The Third programme devoted an entire week, in April, to material originally written, published or performed in 1851. Sixty different operas were broadcast in the Third programme during the year, including first performances of Igor Stravinsky's *The Rake's Progress* in Venice and of Benjamin Britten's *Billy Budd* at Covent Garden Opera house.

Commonwealth. In Australia, government economies caused a reduction of nearly £150,000 in the annual budget of the Australian Broadcasting commission, but the position was restored by a measure introduced into the federal parliament, in November, to raise the licence fee from £1 to £2. During the year the A.B.C. opened two more stations bringing the total to 54. The purchase, by the London *Daily Mirror*, of a network of Australian commercial stations caused widespread reaction and led the federal government to consider amending the Broadcasting act to make it impossible for any commercial licensee to transfer a licence to an oversea interest. Responsibility for external services (Radio Australia) was transferred from the Department of Information to the A.B.C.

The Royal Commission on National Development in the Arts, Letters and Sciences completed its study of broadcasting in Canada, and endorsed the existing radio system operated by the Canadian Broadcasting commission. It recommended that the income of the system, totalling about \$8 million a year from licence fees and some commercial revenue, be supplemented from public funds by about \$14 million a year, or roughly one dollar a head of population. It also recommended that the C.B.C. should have control over television in Canada. By December, the recommendations of the royal commission had not been implemented, though a parliamentary committee on broadcasting had been named.

In South Africa, Springbok Radio, a commercial programme to supplement the existing non-commercial services in English and Afrikaans, was established in Johannesburg and Capetown. Radio Pakistan opened its new broadcasting house in Karachi on July 16. It included 14 studios and the latest frequency modulated transmitters.

Important broadcasting schemes were launched in the British colonies. In Nigeria building began on three main stations, at Lagos (20 kw.), Kaduna (7½ kw.) and Enuga (7½ kw.) which would give short-wave coverage in four languages to the whole of Nigeria. The Lagos station began broadcasting at the end of the year. In Cyprus, work progressed on the building of a 10-kw. medium-wave station at Nicosia to provide a domestic service for the island in Greek, Turkish and English. In Tanganyika, a low-power medium-wave station was set up by the Tanganyika government as a pilot scheme for broadcasting to Africans. Shortage of receiving sets remained a serious problem. There were 800 community listening sets installed in Malaya, which greatly increased the rural audience. In Northern Rhodesia the "Saucepan Special," an all-dry battery set priced at £5 15s., sold during the year at a rate of about 1,000 sets a month.

By the end of the year there were broadcasting services in 24 of the British dependent territories. In 14 of these broadcasting was operated by government, in 7 by a commercial company and in 3 by both. In Singapore the British Far Eastern Broadcasting service opened, in May, a high-power short-wave relay transmitter to improve the B.B.C. service to the far east, southeast Asia and south Asia.

Europe. A significant step was the proposed admission of the German federal republic to the European Broadcasting union. At an E.B.U. meeting in September it was announced that the Arbeitsgemeinschaft der Oeffentlich Rechtlichen Rundfunkanstalten (representing the radio organization of Western Germany) would be admitted as an active member as soon as the federal republic became a member of the International Telecommunications union.

The Italia prize, offered every other year for outstanding radio programmes, was divided between Great Britain and France, each being awarded 9,000 Swiss francs. The winning entry from the B.B.C. was *The Face of Violence*, a play by J. Bronowski with music by Antony Hopkins, produced by

Douglas Cleverdon. *Une Larme du Diable*, by Théophile Gautier, produced by René Clair, was the successful French entry.

The U.S.S.R. and other Cominform countries greatly increased their output of external broadcasting to Italy, Germany, France, Spain and Great Britain during the year. In order to improve the penetration of its broadcasts in western Europe, Moscow took over a number of the domestic transmitters in Hungary, Poland and Czechoslovakia.

Radio Free Europe, operating from Munich with U.S. backing, opened a medium-wave transmission to Czechoslovakia on May 1. On June 1 it began a short-wave transmission to Albania, and on Oct. 6 a short-wave transmission to Hungary. The station broadcast for 12 hr. a day to Czechoslovakia and Hungary, and for 8 hr. a day to the other satellite countries of eastern Europe, to which programmes began in 1950. The station was employing a staff of nearly 1,000 by the end of 1951. (G. WR.)

United States. The Voice of America, operated by the U.S. Department of State, expanded its broadcasts and strengthened its transmissions during 1951. In response to a call by President Harry S. Truman for a great "campaign of truth," the VOA inaugurated programmes in 21 additional languages, directed principally to the far east and to minority groups within the U.S.S.R. The broadcast output was increased from 32 to 50 hr. daily in a total of 46 languages. Construction was begun on a world-girdling network of transmitting facilities designed to reach new audiences and increase penetration of Soviet jamming.

Receiving sets in use in the U.S. during 1951 were estimated at about 104 million, as compared with 90 million in 1950. *Broadcasting-Telecasting Magazine* calculated that the number of radio-equipped homes in the U.S. was about 42,427,000.

Stations. The year 1951 was one of steady but unspectacular growth in the broadcasting field. There was a net gain of 87 amplitude modulation (A.M.) stations during the year. In frequency modulation (F.M.), however, which had never really "caught on" with the public despite the early enthusiasm of broadcasters, the number of stations showed another decline in 1951.

Figures published in *Broadcasting-Telecasting Magazine* showed that 3,161 broadcasting stations—A.M., F.M. and television—were in operation or had been authorized by the end of Dec. 1951. This figure represented a net gain of 57 over the 3,104 reported at the end of 1950. The number of stations actually on the air at the end of 1951, 3,083, was the largest in history. This included 2,295 A.M. stations, as against 2,231 a year earlier, and 648 F.M. stations, as compared with 676 at the end of 1950. The number of television stations in operation increased from 107 to 108.

Transit Radio. One of the major developments in F.M. was facing a Supreme court test at the close of the year. The Supreme court agreed in October to hear an appeal from a District of Columbia court's decision, in a case brought by a group opposed to what they called "forced listening," which held that transit radio "commercials and announcements" were unconstitutional in that they "deprive objecting passengers of liberty without due process of law." The Supreme court, which was expected to hear the case early in 1952, also agreed to consider whether transit radio music and non-commercial announcements, such as weather reports and other public service features, were legal or illegal.

Programmes. The year was marked by much experimenting with new programmes, as broadcasters sought to develop shows that would better meet or offset television competition. A. C. Nielsen Co. estimates indicated that, among early autumn programmes, comedy variety radio shows—which had been tied with general drama for first place in 1950—had dropped to fifth place in 1951. News interest remained at a high

level because of the Korean war and general world conditions.

Broadcasting Revenue and Expenses. According to official figures compiled and released by the Federal Communications commission, gross revenues of the A.M. networks and stations registered a 7.1% gain, reaching \$443,057,845 in 1950. This compared with \$413,784,633 in 1949, which represented a 1.67% increase over 1948. Total broadcast expenditure for 1950 was \$372,314,353, or 4.1% higher than the 1949 figure of \$357,521,718. Total broadcast income (before federal taxes) for these stations amounted to \$70,743,262 in 1950, as compared with \$56,262,915 in 1949. Revenues from the sale of network time totalled \$131,530,216, as compared with \$134,898,325 in 1949; time sales to national and regional advertisers amounted to \$118,823,880 (\$108,314,507 in 1949); and time sales to local advertisers totalled \$203,210,834 (\$182,144,301 in 1949). These totals included commissions paid to agencies, etc., which broadcasters regard as an expense of sale.

Manufacture. The Radio-Television Manufacturers association, which represented more than 80% of the industry, in a preliminary estimate in December placed 1951 production as follows: home radio receivers, 6.7 million; automobile radios, 4.5 million; portable radios, 1.3 million.

Legislation. Senator William Benton stirred up a controversy which reverberated throughout the broadcasting industry by introducing a bill to create a national citizens advisory board on radio and television. The proposed board would review and report on the operation of radio and television in terms of the public interest. The plan was attacked by broadcasters, and some government officials, as raising dangers of censorship; by others it was defended as a wise and legal step to improve radio and television as mediums for enlightening, educating and improving the public. It had not been acted upon finally when congress adjourned, but remained available for action when the second session was convened in Jan. 1952. BUDGET, NATIONAL. Rearmament cast its shadow over the budgetary situation of most countries in Europe, the Commonwealth and the middle east, although actual surplus military spending was not unduly heavy during 1951 compared with the wartime increase in military expenditure. Rearmament was everywhere slow in gathering momentum. In many countries an effort was made to maintain a balanced budget or at any rate to control the deficit. In none of the countries concerned was the amount spent during 1951 large enough hopelessly to compromise budgetary positions. Nevertheless, there could be no doubt that the rearmament factor changed postwar budgetary trends.

Until 1950 postwar deficits were being gradually eliminated or reduced in practically all countries and, without rearmament, normal conditions might have been achieved. It was true that some countries had to struggle with deficits due to specific causes. The deficits in France and Italy remained perennial, though their amount was easily covered by normal borrowing. Israel had to struggle with problems arising from large scale immigration and the need for a newly established state to organize itself. Countries such as Spain, Greece and Turkey, which maintained relatively large armed forces, had to pay the price in the form of high expenditure which was not easily covered by revenue. Yet progress was made in most countries towards budgetary equilibrium.

TABLE I. UNITED KINGDOM BUDGETS, 1949-50 TO 1951-52
(in £ million)

Revenue	1949-50	1950-51	1951-52 est.
Income tax	1,438.4	1,404.4	1,624.8
Surtax	114.7	121.1	128.0
Estate, etc., duties	189.6	185.3	180.0
Stamps	51.5	54.5	55.0
Profits tax	260.8	258.4	312.7
Excess profits tax	36.2	9.4	
Other	0.6	0.6	0.5
Special contributions	19.6	4.9	1.5
Customs and excise	1,519.7	1,630.0	1,651.0
Motor vehicle duties	55.8	61.4	62.0
Broadcast recovery licences	12.6	13.0	13.6
Total tax revenue	3,699.5	3,742.8	4,029.0
Miscellaneous	77.7	81.0	105.0
Sundry loans	20.2	26.9	27.0
Post Office, net receipts	—	1.0	5.4
Surplus stores	79.1	45.4	20.0
Surplus, trading services	47.5	80.9	50.0
Non-tax revenue	224.6	235.1	207.4
Total ordinary revenue	3,924.0	3,977.8	4,236.4
Expenditure			
Interest	472.2	477.8	515.0
Other consolidated fund	47.6	47.5	49.0
Navy, army, ordnance and air	740.7	777.4	1,273.8
Civil, roads and revenue departments	2,096.1	1,935.2	2,339.2
Sinking funds	18.7	19.4	20.0
Total	3,375.3	3,257.3	4,196.9
Surplus	548.7	720.5	39.5

Unfortunately, with very few exceptions, countries endeavoured to balance their budgets not so much by economies as by increases of their revenue. They tended to consolidate their budgetary positions at the highest postwar levels.

A result of rearmament was partly to restore the wartime spendthrift spirit. It aggravated the task of countries that had been unable to reach equilibrium. In addition to the actual outlay on increased military expenditure, the will to achieve economies suffered by the urgent need to spend untold millions.

Rearmament also affected the budgetary position through its effect on prices. On the one hand, the rising cost of living resulted in a demand for higher salaries by civil servants and increased the amount of expenditure, including that on rearmament itself. On the other hand there was an increase of revenue: there was a new nominal increase in national earnings and taxable capacity; certain indirect taxes rose automatically with the rise in prices; because of its inflated purchasing power, the public could well afford to pay higher prices; the proceeds of direct taxation also rose as a result of the increase of incomes.

In one respect, all treasuries benefited by the rise in prices in 1951. It reduced the relative burden of their public debt, the service of which came to represent a smaller percentage of their budgets. At the same time, those countries with a deficit had to resort to new borrowing and to pay higher interest rates.

The countries whose budgetary situations benefited greatly by rearmament were those producing essential raw materials. There was a spectacular rise in their national incomes and, even though a rise in revenue lagged far behind this upward movement, the finance ministers concerned had no reason to complain.

The cost of rearmament was partly compensated for by cuts in expenditure on public works. The extent to which other expenditure items were reduced was usually moderate. Governments shirked unpopular cuts in expenditure: in particular a reduction in social expenditure was considered

to be politically impossible. In some instances the amounts spent on the welfare state were actually increased. For instance, in the United Kingdom a substantial amount was added to old age pensions; at the same time, it must be added, steps were taken to halt the rise in the cost of the national health service.

Revenues during the financial year 1950-51 or 1951 exceeded estimates in almost every country. Owing to this, some countries engaged in rearmament were able to close the year with an actual revenue surplus. Among these countries were the United Kingdom, Belgium, Norway, Denmark, New Zealand, Australia, Pakistan, South Africa and others. But in France, Italy, the Netherlands, Spain, Turkey, Egypt and elsewhere the year was closed with a deficit.

Military expenditure by the United Kingdom was increased, apart from rearmament, by the cost of the Korean war and the disturbances in Malaya and the threatening troubles in the middle east. France had to continue to carry the heavy burden of the war in Indochina.

The budgets for 1951-52 or for 1952 in most countries foreshadowed increases in military expenditure which were partly balanced by the anticipation of further increases in the proceeds of existing taxation and partly by the adoption of new taxes.

In Great Britain there was an increase of income tax and of the tax on distributed profits. Hugh Gaitskell, chancellor of the exchequer, in face of strong left-wing opposition, sought to reduce the cost of the national health service by imposing a charge on certain services. A limit of £400 million had been established for the cost of the national health service and £410 million for the cost of food subsidies. With the aid of these reductions and other measures it was possible to produce a small surplus in spite of the increased military expenditure. Following on the change of government the new chancellor of the exchequer, R. A. Butler, adopted a policy of budgetary disinflation. With the aid of a campaign for the reduction of government expenditure he hoped to achieve a substantial revenue surplus, which would tend to counteract the factors making for inflation.

Canada showed a big budgetary surplus, amounting to \$500 million for the first five months of the fiscal year 1951-52. This was some 15 times larger than the amount expected for the whole fiscal year. The surplus was due in part to larger taxation receipts, but also to inability to spend the whole amount earmarked for rearmament.

India continued to struggle with its perennial budgetary deficit. During the 3½ years of its independence its Treasury cash balance became reduced from Rs. 3,760 million left behind by the British administration (enough to cover a whole year's expenditure) to Rs. 910 million. By the end of the fiscal year 1951-52 this was expected to fall to Rs. 120 million. Although an economy drive was initiated in 1950, almost all expenditure items showed an increase. The total estimated expenditure for 1951-52 increased by Rs. 1,290 million. This was partly balanced by additional taxation.

Pakistan showed a much more satisfactory picture. In spite of increased expenditure and loss of revenue through tax concessions, the budget showed a surplus of Rs. 207.4 million compared with Rs. 289.6 million in 1950-51. Part of the surplus was allocated to a special fund to finance the establishment of arms-manufacturing industries. The satisfactory position was largely the result of the rise in the prices of Pakistan's staple raw material exports.

In Australia the government adopted a policy of disinflation through budgetary surpluses. Owing to the increasing yield of taxation it would have been possible to balance the budget without additional taxation, in spite of the increase of expenditure from £A 784 million to £A 927 million. In spite of this the government adopted new taxes to a total of

£A 160 million. This was expected to raise revenue in 1951-52 to £A 1,091 million, of which £A 957 million would constitute taxation revenue.

New Zealand was able to grant rebates to a large number of taxpayers in spite of the increase of expenditure to £NZ 208 million, an increase which was largely due to defence costs. Both Australia and New Zealand benefited to a considerable extent by the high price of wool and other staple products.

The Union of South Africa increased its defence expenditure for 1951-52 by £SA 13.4 million. Further £SA 7.9 million were allocated for pensioners' bonuses. A deficit of some £SA 8 million resulting from these measures was converted into a small surplus through additional taxation.

Among the European countries the budget of France for 1951 showed an expected deficit of Fr. 600,000 million. Without U.S. aid it would have been Fr. 700,000 million. Revenue was estimated at Fr. 2,104,000 million.

The Italian budget showed an increase of revenue from L. 1,227,000 million in 1950-51 to L. 1,455,000 million in 1951-52. Expenditure increased to a much larger degree, from L. 1,397,000 million to L. 1,824,000 million. Even so the relative importance of the deficit was much lower than in earlier postwar years. In 1947-48 it amounted to as much as 50% of the total expenditure.

The Netherlands succeeded in reducing its deficit through the increase of revenue from Fl. 3,942 million in 1950 to Fl. 3,992 million in 1951 and the reduction of the expenditure from Fl. 4,487 million to Fl. 4,312 million.

Among the Scandinavian countries Denmark succeeded in balancing the budget for 1951-52 at nearly Kr. 200 million below the previous year. Sweden continued to show a budgetary surplus for 1951-52 in spite of the increase of expenditure from Kr. 4,838 million to Kr. 5,367 million. Revenue increased to a more pronounced extent, from Kr. 4,998 million to Kr. 5,709 million. Likewise Norway budgeted for a surplus of Kr. 475 million for 1951-52 in spite of the increase of military expenditure from Kr. 400 million to Kr. 500 million.

Spain's budget for 1952-53 showed a deficit of P. 269 million. Defence expenditure represented 32.8% of the total expenditure of P. 22,477 million. Switzerland showed an appreciable revenue surplus for 1951, revenue being S.Fr. 1,901 million and expenditure S.Fr. 1,577 million.

(P. Eg.)

United States. The U.S. budget submitted to congress by President Harry S. Truman on Jan. 21, 1952, recommended expenditures of \$85,444 million for the fiscal year ending June 30, 1953, an increase of about \$14,500 million over fiscal 1952. On the basis of existing tax laws, it was expected that revenues in fiscal 1953 would total \$70,998 million as compared with an estimated \$62,680 million in fiscal 1952. On these estimates there would be a deficit of \$14,446 million as against an estimated deficit of \$8,201 million for 1952.

The president noted that "... partly as a result of inadequate revenue legislation last year, we were now confronted with the impracticability of financing government expenditures currently out of taxes for the next year or so." However, he suggested that, "at the very least," additional revenue be raised to the amount (about \$5,000 million) by which legislation in 1951 fell short of his recommendations.

The 1953 budget, the president stressed, was dominated by "major national security programmes," military services, international security and foreign relations, the development of atomic energy, the promotion of defence production and economic stabilization, civil defence and merchant marine activities. The expenditures earmarked for such programmes formed 76% of the total budget.

The bulk of the projected increase in the 1953 budget was for the purpose of strengthening and expanding the armed

forces. Comprising 60% of the budget total, an outlay for military services of more than \$51,000 million was recommended. The largest increase provided in the military services budget was for aircraft procurement, which would be expanded from \$5,800 million to \$11,000 million.

The United States budget for 1951-52 showing the sources of revenue and items of expenditure represented as parts of the dollar.

The other increase of large magnitude in the 1953 budget was for foreign policy and international programmes, consisting mainly of military and economic and technical assistance to friendly nations in Europe, the middle east and Asia. Total expenditures in this category were projected at \$10,800 million, substantially above estimated outlays of \$7,200 million in fiscal 1952. The increase was attributed by the president to "a sharp acceleration in deliveries of military equipment to our allies overseas."

The government's programmes to conserve and develop natural resources were estimated to require expenditures of

TABLE II. U.S. BUDGETS, FISCAL YEARS 1951-53 (in \$ million)

	Actual 1951	Estimate 1952	Estimate 1953
Receipts			
Direct taxes, individual	24,095	30,064	33,005
Direct taxes, corporation	14,388	22,900	27,800

General government	1,209	1,353	1,484
Interest	5,714	5,955	6,256
Reserve for contingencies	—	25	100
Adjustment	— 705	—	—
Total	44,633	70,881	85,444
Deficit	—	8,201	14,446
Surplus	3,510	—	—

Detail will not necessarily add to totals because of rounding.

\$3,237 million, as compared with \$3,082 million in fiscal 1952. Outlays for atomic energy comprised more than one-half of these totals. At a seminar for newsmen just prior to release of the budget, President Truman announced that authorization later would be requested for a \$5,000 million to \$6,000 million expansion of atomic energy facilities over a period of about five years.

Under the category of education and general research it was recommended that expenditures be increased from \$238 million to \$624 million. By far the largest part of the increase was attributable to proposed grants of \$290 million to the states for the operation and maintenance of elementary and secondary schools. Other legislation proposed by the president called for \$35 million to help to provide schools in communities overburdened because of federal activities and \$30 million to give financial aid to "capable young people who otherwise would not attend a college or university."

Expenditures for social security, welfare and health were estimated at \$2,662 million, slightly less than in the previous year. The largest decrease among the budgetary programmes was projected for services and benefits to veterans; outlays for 1953 were estimated at \$4,200 million or about \$1,000 million less than in 1952.

The federal government's two largest sources of revenue, income taxes on individuals and income and excess profits taxes on corporations, were expected under existing law to provide revenues of more than \$60,000 million in fiscal year 1953, comprising more than four-fifths of the estimated total of budget receipts. (See also TAXATION; WEALTH AND INCOME, DISTRIBUTION OF.) (C. F. Sz.)

BUENOS AIRES. Capital of the republic of Argentina, the largest city in the southern hemisphere and of Latin America, and the largest Spanish-speaking city in the world. Area (federal district): 71 sq.mi. Pop. (1947 census): 3,000,371.

Prosperity was matched with scarcity. Never before did industrialists and landowners have so much money to spend; never before had the poorer classes experienced such difficulty in obtaining normal supplies of certain commodities (meat and milk, for example) which in the past had been taken for granted in this land of plenty. A spectacular gesture against the rising cost of living was the inauguration by President Perón's wife of a chain of grocery stores which, subsidized by the Eva Perón foundation, charged lower prices than the ordinary shops.

Many political demonstrations occurred in the city during this electoral year. In August a Peronista rally of about 100,000 children and their parents took place in and around Luna park. Thousands of toys were given to the children, while motor vans distributed fruit and cakes. An abortive *coup d'état* at the end of September was primarily a Buenos Aires movement. The outbreak originated in the nearby military barracks at Campo de Mayo and the adjacent air base of El Palomar. Aircraft flew over the centre of the capital dropping revolutionary pamphlets, and loyal workers constructed barricades to prevent rebel troops from entering the city. The rebels, however, were overcome before leaving Campo de Mayo, and within a few hours General Perón appeared on the balcony of the Casa Rosada to announce the failure of the insurrection.

Early in November, Señora Perón entered a public hospital in the working-class suburb of Avellaneda to undergo an operation.

At the presidential elections on Nov. 11, the female vote was decisive in the capital. The men of Buenos Aires gave only 373,000 votes for Perón, 413,000 for his Radical opponent; but 457,000 women voted for Perón and only 206,000 for the Radical, Ricardo Balbín. (G. P.)

BUILDING AND CONSTRUCTION INDUSTRY. Against a background of increased wage rates and materials costs, the building industry sought during 1951 to adjust itself to the changes brought about by rearmament. Normal civil building was replaced by building for defence purposes to the extent of about 10% and it was forecast that this proportion would be considerably increased during the 3-year defence programme. Work was seriously hampered by shortage of steel and it was frequently stated that this was the biggest obstacle to building production. The housing programme remained unaltered at 200,000 houses a year, until the promise to raise the number to 300,000 became one of the principal planks in the Conservative platform at the general election. It was ultimately concluded that the target could be raised only gradually and there were many who felt that increased production of houses could be obtained only at the expense of other building.

Labour relations remained good although there were occasional calls for nationalization from the trades union leaders. Wage increases amounting, in all, to 3d. per hr. (bringing their rate to 3s. 3d. per hr. in London) were negotiated for skilled craftsmen and incentives payment schemes were extended, so that most workers were able to earn weekly wages substantially greater than the standard rate. It was often stated that the operation of these schemes was resulting in very considerable increases in production on housing sites. Nevertheless, recruitment of apprentices to the industry remained inadequate, particularly in plastering and, to a less extent, in bricklaying. Employers' organizations gave further evidence of their concern for recruitment and training by establishing schemes of awards and by active encouragement of their members to indenture apprentices to the skilled crafts and to make formal provision for the training of administrative and technical staff.

There were signs of progress in the development of new methods of construction, particularly for schools, and in the use of pre-stressed concrete. This last development, owing much to the scarcity of steel, was clearly an outstanding contribution to constructional technique although much remained to be learned of its behaviour in the region of ultimate load. Mechanization on building sites attracted the attention of many contractors and considerable savings of cost were attributed to a new type of crane which first made its appearance in London late in 1950. Experiments in the design and construction of low-cost housing were promoted by various interests but, in general, building costs continued to rise. A comparison between Great Britain and Sweden in this respect did not, however, favour Sweden and in the United States the position seemed no better.

In these circumstances, there was every reason to welcome the first international Building Research congress which met in London in September and achieved notable success. A distinguished group of research workers and other specialists in building studies read papers in five sections of the congress, each section being devoted to some well-defined aspect of the design or construction of buildings. The reluctance of the industry to take advantage of the results of research was stressed at several of the discussions, the evidence from western Europe and from the U.S. differing little from that from Great Britain so far as established methods of small-scale building were concerned. Several reasons were advanced for this reluctance to innovate: the craft organization of the industry, its low level of technical competence and the peculiar advantages of established methods of construction. Since building contractors in general were not conspicuous amongst the speakers in the congress discussions it seemed doubtful if any rapid increase in the rate of absorption of results of research was to be

expected. It was notable, however, that in the less complex, larger-scale work, described in Great Britain as civil engineering, as distinct from building, development continued satisfactorily. The opening of a new structures research laboratory by the Cement and Concrete association drew attention to the scope of the work undertaken at their research establishment and promised further extensions of the use of concrete in the structural field.

There were signs that attention was being paid to the recommendations of the working party's and productivity team's reports of 1950. The national organizations of architects and building contractors issued a joint statement on the need for adequate planning in advance of contracts, and a committee was appointed to assist with the revision of the model byelaws, now 15 years old. Some controversy broke out during the late summer about the operation of an organization of building contractors whose principal object was to limit the effects of competitive tendering. Although unrestricted competition in this field had long been regarded as undesirable, few were prepared to declare themselves in favour of systematized control. (D. A. G. R.)

United States. Despite federal restrictions and threats of material shortages, total expenditure for new construction in the United States amounted to \$30,000 million during the first 11 months of 1951, an increase of 7.8% over the comparable period of the previous year. Rising construction costs, however, served to inflate the dollar value figure. Thus the amount of construction work begun in 1951 was about the same as in 1950.

Construction costs continued to increase during 1951, but at a declining rate as the year progressed. In the early months the Department of Commerce composite index was 12% higher than for the first quarter of 1950. For the next four months, however, there was virtually no change in the index, which stood at approximately 237 (1939=100), and by August construction costs were only 5.4% above the comparable month of the previous year. During the first half of 1951 further governmental limitations and restrictions on the construction of non-essential facilities were involved, and on Aug. 3 a new basic order was announced, under which the construction of all types of buildings, structures or projects requiring the use of more than specified quantities of controlled materials could be undertaken (or continued if already begun) only if the private contractor received federal authorization and a related allotment of materials.

Building and construction activity in 1951 provided employment for more than 2,500,000 workers on the average per month—a record in the history of the industry. The record number of 2,791,000 workers employed was reached during August. The index of union hourly wage rates stood at 189.0 (1939=100) at mid-year, an increase of 7% over a 12-month period.

The number of domestic dwelling units put under construction amounted to 1,022,600 units in the first 11 months of the year. The single-family house was by far the most popular type of new dwelling, accounting for more than eight out of every ten new units started. As from Dec. 7, 1951, local housing authorities throughout the nation had 585 publicly subsidized permanent low-rent dwelling projects comprising 100,252 new housing units under construction, of which 68,760 had been started after the first of the year. These dwellings were to be occupied by families whose income was not sufficient to allow them to rent or purchase adequate homes.

The office of the economic stabilization director recommended a sharp reduction in housing construction for 1952 to somewhere between 450,000 to 500,000 family units as an anti-inflationary device. The Defence Production administration maintained that there were adequate materials for 700,000 dwelling units, while the Housing and Home Finance agency

estimated the national need to be in the vicinity of 900,000 dwellings. For the first three months of 1952, however, the Defence Production administration authorized a sufficient amount of steel, copper and aluminium to permit a home construction rate of 850,000 a year. (See also ARCHITECTURE; HOUSING.) (CH. RA.)

BULGANIN, NIKOLAY ALEKSANDROVICH, Soviet politician and army officer (b. Nizhny Novgorod [now Gorky], 1895), joined the Communist party in 1917 and in 1918 was a member of the Extraordinary Commission for Repression of the Counter-revolution (*Cheka*). From 1922 he held executive posts in the electrical industry. During 1931-37 he was secretary of the Moscow city committee of the party, "mayor" of the Soviet capital. In 1938 he became head of the state bank and chairman of the council of people's commissars of the Russian S.F.S.R. and deputy chairman of the council of people's commissars of the U.S.S.R. In 1939 he was elected a member of the central committee of the party, but he was appointed a substitute member of the politburo only in 1946 and a full member in 1949. He put on military uniform first in Oct. 1941 as political commissar to General G. K. Zhukov's army group, whose task was to defend Moscow. From July 1944 he was representative to the Polish Committee of National Liberation and on Dec. 22, 1944, as a full general, he succeeded Marshal K. E. Voroshilov as deputy commissar of the Soviet armed forces. In this capacity Bulganin's prestige rose considerably: on March 19, 1946, he was appointed a deputy chairman of the council of ministers and on March 3, 1947, as a marshal of the Soviet Union, he succeeded Joseph Stalin as minister of the armed forces. On March 24, 1949, he was relieved of the latter duties, but remained a deputy premier and, it was believed, became the chief inspector of the Soviet satellite armies.

BULGARIA. People's republic in the eastern part of the Balkan peninsula, bounded N. by Rumania, W. by Yugoslavia, S. by Greece and E. by Turkey and the Black sea. Area (incl. southern Dobruja): 42,796 sq.mi. Pop.: (1946 census) 7,022,206, (mid-1950 est.) 7,300,000. Language (1947 est.): Bulgarian 88%, Turkish 9.8%. Religion (1947 est.): Greek Orthodox 84%, Moslem 11.5% (of whom one-sixth Pomaks, or Moslem Bulgars, remainder Turks), Roman Catholic 0.9%, Gregorian Armenian 0.4%, Jewish 0.3%, Protestant 0.2%. Chief towns (pop., 1947 est.): Sofia (cap., 434,888); Plovdiv (125,440); Varna (77,792); Russe (53,420). Chairman of the presidium of the National Assembly, General Gheorghii Damianov; prime minister, Viko Chervenkov.

History. In contrast with the more northerly and economically more developed people's democracies, Bulgaria did not revise its five-year plan. It was probable that the existing targets were quite as ambitious as so backward a country could hope to achieve. In so far as scarce raw materials and machinery were allocated for the whole eastern European region by the supreme planners in Moscow, it might be expected that Bulgarian industrial projects had the lowest priority of all. The argument so much emphasized by Yugoslav propaganda, that Bulgaria was being treated as an agrarian colony of the Soviet imperialists, had some basis in fact. Bulgarian spokesmen, however, continued to stress their state's industrial progress. Premier Chervenkov, in a speech on Sept. 8, 1951, on the eve of the 7th anniversary of "liberation," boasted that Bulgaria produced all forms of agricultural machinery except tractors and combines, and such electrical equipment as motors, automatic telephone exchanges and wireless sets. A nitrogenous fertilizer plant with a yearly capacity of 70,000 tons would soon be in

operation. Meanwhile great progress, he claimed, was being made with the electrification of the country. On Sept. 26 it was announced that the Ministry of Industry had been divided into two: a Ministry of Heavy Industry under Anton Yugov and a Ministry of Light Industry under Atanazi Dimitrov. Labour conditions were tightened up at the end of 1950. A law for the protection of state property included very severe penalties, and was so phrased as to enable the most sinister interpretation to be placed on acts of negligence. A decree forbade workers to change their job, and forbade any factory to employ new workers, unless the workers had official permits from the cadres department of their local authority (people's committee). The wages system was further remodelled on the Soviet system of progressive piece-rates. By August it was officially claimed that it was stimulating output considerably.

Bulgaria remained far ahead of the other people's democracies in its progress towards collectivization of agriculture. By June collective farms included more than half the peasant population of the country and nearly half its arable land. In the main grain-producing areas—the Dobruja and the plains on the south bank of the Danube—a large majority of all peasant holdings were included in collective farms. The average collective farm included 220 peasant families and possessed 845 hectares of land. The methods by which these results were obtained caused a good deal of administrative confusion and controversy within the Communist party ranks. Already on Feb. 7 a decree introduced the brigade system, by which peasants worked in groups of 40 to 60 under a foreman and were paid according to their output. On April 7 Chervenkov complained of abuses committed in the countryside by party members and of a "distortion of the party line." On June 3 a special political administration, controlled directly by the Communist party, was set up in the Ministry of Agriculture, and political departments of party members were attached to machine-tractor stations and state farms. These departments were copied from the Soviet experience of 1933-34. The decree which set them up stated: "The organs of the party and the state can no longer confine themselves to giving instructions and financial and material aid: they must take into their own hands the direction of co-operatives, state farms and machine tractor stations." On June 23 the minister of agriculture, Titko Chernokolev, was dismissed and replaced by Nikola Stoilov. On Sept. 22 there were official complaints that the "statute" of the collective farms was being violated. In particular land had been used for other purposes than those laid down in official directives and members had been given excessive advances on their pay.

The pace of collectivization in Bulgaria was comparable to that in the Soviet Union in 1929-33. The fact that it was far more difficult for independent observers to visit the Bulgarian countryside than it had been then to visit the Soviet countryside made it impossible to compare the results. There were some indications of slaughter of animals by peasants and some reports of minor armed clashes between peasants and police. Bulgarian peasants from the western provinces fled to Yugoslavia and told of an atmosphere of terror in the Bulgarian villages. There was plenty of evidence from official Bulgarian sources that the harvest was going badly, and it was a reasonable interpretation that this was at least partly due to refusal by peasants in some areas to cultivate crops from which they knew that they would gain nothing. The reasons for the dismissal of Chernokolev and the reorganization of the ministry were not clear. But it seemed likely that the minister had been considered by Chervenkov and his Soviet masters too indulgent to the peasants. In general ever since 1947 the trend of government policy had been to increase the pressure on the peasants. Though there

might be occasional short retreats the trend was not likely to change.

By a ministerial reshuffle of Dec. 29, 1950, Ivan Mihailov became a deputy premier, and Gheorghii Veselinov was appointed minister of the interior in place of Russi Hristozov, who became minister of food and supplies. In June 1951 the minister of local economy and public works, Petr Kamenov, was relieved of his duties. On July 17 was published a report by the State Control commission on its survey of government departments and nationalized enterprises. It found that administrative personnel was much in excess of the numbers laid down by law, that public funds were extravagantly spent and that the Ministry of Finance was not exercising effective control over other departments' expenditure.

The hate campaign against Yugoslavia continued throughout the year and there were a number of spy trials.

The progress of Bulgarian culture was indicated by the increased diffusion of Soviet literature. In 1948, 328 works by Soviet authors had been published in Bulgarian translation in 2 million copies. In 1950, 681 were published in 5.8 million. In the same year 1,500,000 copies of books were imported into Bulgaria from the Soviet Union. (See also EASTERN EUROPEAN ECONOMIC PLANNING.) (H. S.-W.)

Education. Schools (1949-50): kindergarten, including part-time schools 1,403, pupils 57,487, teachers 2,124; primary 6,112, pupils 755,628, teachers 18,801; elementary 2,960, pupils 308,160, teachers 12,636; secondary 218, pupils 112,633, teachers 4,624; technical 101, pupils 26,800, teachers 943. Universities and institutions of higher education (1947-48) 9, students 49,800, professors and lecturers 1,283. Illiteracy (1946) 23%.

Agriculture. Main crops ('000 metric tons, 1947; 1948 in brackets): wheat 912 (1,503); rye 95; barley 131 (249); oats 77 (105); maize 783 (890); sugar, raw value (1949; 1950 in brackets) 55 (46); tobacco 48 (20). Livestock ('000 head): cattle (1950) 2,140; horses and mules (1948) 449; sheep and goats (1948) 8,995; pigs (1950) 1,500; poultry (1947) 10,329. Wool production, greasy basis ('000 metric tons, 1950: 1951 in brackets) 12.2 (12.7). Wine production (1949): 426,000 hl.

Industry. Fuel and power: coal and lignite ('000 metric tons, 1947; 1948 in brackets) 4,111 (3,933); electricity (million kwh, 1948; 1949 in brackets) 533 (551). Index of industrial production (on basis of 1938=100, 1949; 1950 in brackets): 227 (280).

Foreign Trade. (Million leva, 1948): imports 35,119; exports 34,114. Main sources of imports (1949): U.S.S.R. 64%; other eastern European countries 26%. Main destinations of exports: U.S.S.R. 48%; other eastern European countries 34%. Main imports: metals, machinery and textiles. Main exports: tobacco, wines and spirits.

Transport and Communications. Roads (1945): 13,870 mi. Licensed motor vehicles (Dec. 1950): cars 6,000; commercial 5,000. Railways (1949): 1,996 mi. Telephones (1948): 54,347. Radio receiving sets (1949): 205,000.

Finance and Banking. Budget (million leva): (1950 est.) balanced at 211,866; (1951 est.) revenue 271,794, expenditure 267,922. National debt (March 31, 1947) 68,896. Monetary unit: *lev* (pl. *leva*) with an exchange rate (Nov. 1951) of L. 810 to the pound and L. 290 to the U.S. dollar.

See G. Dimitrov, *Selected Speeches and Articles* (London, 1951).

BURMA. Independent federal republic lying on the eastern side of the Bay of Bengal, with Pakistan and India on the northwest, Tibet on the north and China, Indochina and Thailand (Siam) on the east. The republic comprises Burma proper, the Shan state, the Kachin state, the Chin special division and, when it is constituted, the Karen state. Area: 261,749 sq.mi. Pop.: (1941 census) 16,823,798; (1949 est.) 18,300,000. Racially, the peoples of Burma are Mongoloid. About 90% are Buddhist by religion, and about 70% use the Burmese language. Largest indigenous minorities (1931): Karens 1,367,673, of whom 218,790 were Christians; Shans 1,057,406; Chin-Kachin group c. 750,000. Largest immigrant minorities: Indian (1931) 1,017,825 divided equally between Moslems and Hindus; Chinese (1941) c. 380,000. Chief towns: Rangoon, capital and main port (pop. 1941, 501,291); Mandalay (pop. 1941, 163,537); Moulmein (pop. 1931, 65,506); Bassein (pop. 1941, c. 50,000) and Akyab

(pop. 1931, 38,094). President of the republic, Sao Shwe Thaik; prime minister, Thakin Nu.

History. The country continued throughout 1951 to be troubled by the operations of various types of rebels, notably the Burma Communist party, the Communist party (Burma) and the Karen National Defence organization, all of whom maintained their resistance against the forces of law and order. The year was a disappointing one for the government with regard to military operations, for no real success was gained. The government forces held the principal towns and, more precariously, the principal lines of communication; but none of these was completely secure; thus the Rangoon-Mandalay railway line, though at times open to traffic, was frequently disrupted by sabotage. On Sept. 14 rebels raided Mergui and killed the deputy commissioner, and even Rangoon was more than once troubled by the cutting of the pipe line bringing its water supply from the hills of the Pegu Yoma. Away from the towns and principal communications, moreover, the government's hold on the country was tenuous in the extreme, and over wide areas law and order did not exist. In general, there was a distinct tendency for the Communist rebels to move northwards and northeast, and in the view of some observers their intention was to consolidate themselves in an extensive area on the Chinese frontier where they would be more accessible to any aid that might be forthcoming from Communist China. There was also a tendency for increasing co-operation between different types of rebel, and both the Burma Communist party and the Karens seemed to have reached a stage when they had come to dislike the government more than they disliked one another. Some hope of reconciling the Karens to the lawful régime was aroused by the government's proposal to set up a Karen state, comprising the Salween district and so much of adjacent areas as were predominantly Karen in population, with a wide measure of local self-government similar to the local autonomy enjoyed by the Shan and Kachin states; but at the end of the year it was not apparent that this measure was sufficiently far-reaching to satisfy the Karens.

A further element of disorder was the presence in the Shan state of Kengtung, in the east of Burma, of a force of Chinese Nationalist troops. These, consisting mainly of Kuomintang forces which had fled into Burma early in 1950 before the advance of the Chinese Communists into Yunnan, had held out in Kengtung despite all efforts of the Burmese government to dislodge or capture them; and in July 1951 they attempted an invasion of Yunnan. This incursion was repelled and the Kuomintang force thereafter maintained itself in the Shan states, living on the countryside and presenting a possible cause of discord between Burma and China.

The general conditions of disorder affected the European population in some cases. On Feb. 27 two Europeans engaged in the tin-mining industry in the Tavoy district were murdered by rebels; in April the manager of a rubber estate was kidnapped; and in November another rubber planter was kidnapped and held to ransom. Disorder necessarily affected the country's finances; and the budget for 1951-52, introduced on Aug. 30, provided for expenditure of Rs. 919·3 million and revenue of Rs. 745·5 million, so giving a deficit of Rs. 173·8 million. The deficit was due to heavy expenditure on defence forces and police.

Despite the widespread disorders, the first general elections since Burma attained independence in 1948 were held during the year. The elections took place in three stages, the first in June in 67 constituencies in the least-disturbed parts of the country, the second in 36 constituencies in August and the remainder in some 90 constituencies in November. Unfortunately the charges of malpractice brought by defeated candidates were so numerous that the final results were still

unknown at the end of the year; but it was evident that the Anti-Fascist People's Freedom league (A.F.P.F.L.)—the main support of the government—was in general successful. According to the press, in 43 constituencies in the first electoral group, the league won 26 seats. The principal opposition party, the Burma Workers' and Peasants' party, which had hived off from the Socialist party—the chief component of the A.F.P.F.L.—in Dec. 1950, was avowedly Marxist in attitude, sympathetic to the Soviet Union and seeking to align Burma with the Communist states as against the democracies; but it professed a policy of constitutional opposition. It made little appeal to the electorate, however, and gained only three seats in the first series of elections. Attempts were made to form a united opposition under the leadership of Ba Maw, the wartime dictator of Burma during the Japanese occupation, but these efforts came to little.

Rice production was well maintained during the year, and exports totalled over 1,300,000 tons, as compared with 1,800,000 in 1950; but even so the total compared poorly with the prewar average export of over 3 million tons. In other fields of economic activity, measures to facilitate production took the form of proposals for joint ownership between the Burmese government and the European concerns dominating the petroleum and mining industries. An agreement was reached with the Burmah Oil company whereby the government, aided by a loan of £2½ million from the British Treasury, were to become owners of one-third of the stock of the concern; and a similar plan was in hand for joint ownership of the Burma corporation's silver and lead mining concern at Bawdwin-Namtu in the Shan states. The close association of the government with these concerns was expected to reconcile Burmese opinion to the continued participation of Europeans in the country's economic life.

Burma also benefited from E.C.A. aid. Under an economic co-operation agreement, the United States made available a sum of \$1·5 million to reconstruct and modernize the ports of Akyab, Bassein, Moulmein, Mergui and Tavoy, and a further \$1 million was provided for the improvement of the port of Rangoon.

Dr. Gordon Seagrave, a well-known U.S. medical missionary, was in January convicted of aiding the rebel forces and sentenced to six years' imprisonment; on appeal the High court reduced the sentence to the 51 days that Dr. Seagrave had already been detained; and on a further appeal the Supreme court quashed the conviction. (B. R. P.)

Education. Schools (1948): primary 4,795, pupils 431,684, teachers 11,315; post-primary 142, pupils 11,648, teachers 722. Teachers' training college 1, with over 200 trainees. Universities (1950) 2, students 3,350 (including 780 women).

Agriculture. Main crops ('000 metric tons, 1950-51): rice 4,080; groundnuts 147; cottonseed 11; sesame seed 40·1; cotton, ginned, 6; dry beans 50. Livestock ('000 head, Jan. 1950): cattle 4,488; sheep 21; goats 172; pigs 402; buffaloes 721. Fisheries: total catch estimated at 500,000 tons annually.

Industry. Factories (1947) 473; persons employed 46,480. Raw materials ('000 metric tons, 1950; 1951, six months in brackets): tin concentrates 1,709 (853); natural rubber 15·8 (6·6); lead (1948) 7·5; silver (fine oz., 1948) 480,000; timber, teak (1948-49 rafting season) 68,938 logs.

Foreign Trade. (Million rupees, 1950; 1951, six months, in brackets): imports 432 (296); exports 661 (492). Main sources of imports (Jan.-June 1950): India 39·6%; U.K. 31·4%; China 4·1%; Persia 4·1%. Main destinations of exports: Ceylon 30·5%; Japan 17·3%; India 11%; Indonesia 10·5%. Main imports (1948-49): textiles 36%; food products 13%; machinery appliances and vehicles 11%. Main exports: rice 82%; metals and ores 3%.

Transport and Communications. Roads (1949) 12,472 mi. Licensed motor vehicles (Dec. 1950): cars 5,100; commercial 24,000. Railways (1950) 1,777 mi.; passenger-mi. 80 million; net freight ton-mi. 93 million.

Finance and Banking. Budget ('000 rupees, 1951-52 est.): ordinary revenue 583,772, ordinary expenditure 542,457; capital revenue 161,801, capital expenditure 376,789. Monetary unit: *rupee* with an exchange rate of Rs. 13·33 to the pound and Rs. 4·762 to the U.S. dollar.

BUSINESS REVIEW. Business in 1951 was under the influence of the Korean war and of the rearmament started by it. The United States, followed by other United Nations countries, decided to rearm and the immediate effect was a violent rise in the price of most of the important raw materials. This was well under way at the beginning of 1951 and reached a climax during its first quarter, being evident, for example in the price of cotton, linseed, tin and wool. The less important fibres, such as jute, manila, hemp, sisal and flax, followed a very similar course. Other commodities, such as copper, continued strong, though stocks in 1951 were rather larger than they had been in 1950.

The extremely high prices in the first quarter were almost certainly, in part, the result of panic buying and its ensuing reaction. This reaction was aggravated in June by the suggestion made by J. A. Malik that negotiations for a Korean truce should be started. The boom in raw material prices had been caused in part by U.S. buying for the stockpile, and this proved capable of exerting a steadying effect. In August, for example, the U.S. authorities announced that they would rather draw tin from the stockpile than pay fancy prices, and this announcement immediately caused prices to decline. Viewed in retrospect, the curve of commodity prices took the shape of a pronounced hump, without any clear indication that prices were likely to drop below the pre-Korean level. The panic buying on the raw material markets was imitated by the retail buyers of many countries. Here, too, the excess of goods piled up in the early months of 1951 led to a reaction later on.

There was a natural time-lag between the movements of raw material prices and the prices of the corresponding finished articles. In Britain, for instance, suits made from the dearest sorts of wool (those of the first quarter of 1951) did not appear in the shops until November. On the whole, therefore, the trend of retail prices was upward throughout the year. This trend was accentuated when the preparation for, or the actual start of, rearmament diverted labour and raw materials from civilian production. This rise in prices was often erroneously referred to as inflation; in fact, it simply registered scarcities. But there was a genuine inflationary movement in Australia, where the wool cheque provided a large volume of money, while it proved impossible to import a corresponding amount of goods. In terms of business these price movements translated themselves into rather feverish activity early in 1951, followed by slackening later in the year.

In many countries, the effort of rearmament was exerted by economies already severely strained. The new capital outlay was too great to be met by current production, in such countries as Great Britain and Western Germany; in some countries, such as the United States, although no such "inflationary gap" existed, the budget was unbalanced. In either case, a pressure was generated which tended to raise prices and, to this extent, to stimulate business.

But although rearmament was the most powerful single factor in the business situation, it was not the only one. It was superimposed on the long-term trend to recovery from World War II—a trend powerfully supported by Marshall aid which, though diminishing, still played a large part in the economies of France and Western Germany. Military aid also played its part. The long-term development was reflected, for instance, in a large increase in steel production in every country of Western Europe except Great Britain, where production was already running almost at full capacity. Further evidence could be found in the growing tonnage of ships under construction, particularly in Western Germany and in Japan, and in the increasing turnover in world trade, with which, of course, the ship-building programmes were closely connected.

The situation was complicated by the danger that, in view of the strain on many national economies, a slump might be induced, if not by an excess of finished supplies, then from a deficiency of raw materials. Business might slow down simply because a lack of raw materials made profitable working impossible. There were, in fact, indications that the shortage of coal was bringing this about in Western Germany. Even in the United States, the shortage of steel hampered the erection of factories during the second half of 1951; but on the whole this difficulty did not cause any major trouble.

A controlling part in the world's business fluctuation continued to be played by the U.S., where the development set a pattern for most of the industrial countries. At the beginning of 1951 the buying boom, which had been initiated by the war in Korea, was still in full swing. During January the sales of department stores were 31% higher than a year earlier. The fear of scarcities, which had been at work earlier, was reinforced by the fear of higher prices—an apprehension shared by the administration. Accordingly, a number of price controls were imposed early in 1951. These measures had a steadying effect, which was strengthened by the fact that some unemployed resources were brought into use. Some of the business done was still of the nature of panic buying, but this was diminishing, and by the end of the first quarter of 1951 the volume of retail sales began to fall. However, this probably meant no more than that retail buying was levelling down to the actual rate of consumption. The result (since producers could not immediately throttle down their output) was a certain amount of overstocking. This, in turn, reacted on the production of consumer goods, which, by May, showed a decline. The beginning of armistice conversations in Korea in July accentuated the general satiety of consumers.

Conditions in the retail trade must be considered against the background of business in capital goods, which was increasingly affected by rearmament. At the beginning of 1951, armament orders were coming in slowly, but during the second quarter orders worth \$10,000 million (£3,600 million) were placed. This was nearly as much as was sanctioned during the whole of 1950. In other directions, output of capital goods (houses, for instance) was deliberately curtailed. But industry followed a vigorous policy of re-equipment, and not for armament work alone. An increase of 40% over the 1950 expenditure on plant and equipment was forecast, and seemed likely to be fulfilled during 1951. On the whole, the decline in the absorption of consumer goods was balanced by the increase in the output of capital goods. Moreover, there appeared to be a great latent demand for consumption goods, ready to make itself felt if prices fell.

After the United States, western Europe was the most important economic region. The difference between victorious and defeated states, still significant in 1950, had lost much of its importance in 1951. It was obliterated partly by the passing of time, partly by U.S. aid—which was applied in accordance with economic need and not with political resentments—and partly by the working of the European Payments union, which, though subjected to heavy strains (notably in Belgium), permitted a much larger exchange of goods in western Europe than would have been possible without it.

A boom resulting from scarcities is liable to end when consumers' resources become strained. In the U.S., consumers eventually reduced their buying from choice: in western Europe, because they had to. This applied to the so-called buyers' strike in Great Britain, and the same cause was at work in poorer countries like Western Germany and Italy. Both countries shared the liberal economies of the United States, and, to this extent, were predisposed to abrupt changes in business sentiment. In Western Germany,

signs of over-stocking appeared early in 1951; the strength of the preceding rush to buy can be gauged from the fact that applications for import licences for coffee totalled 60 times the normal amount. This over-buying resulted in a certain stagnation. Easter trade brought little help and by the middle of the year it became necessary to lower the prices of textiles, leather and other goods. Drastic steps were thought necessary to clear stocks, and at the summer sales some goods were almost given away. These measures did succeed in clearing stocks, though probably in some instances at a loss. Nevertheless, a certain amount of short time was being worked, and many retailers were driven to "rationalization"—the typical precursor of a depression.

In the capital goods industries business declined. This was true of building as well as of machinery. In some sections, however, demand remained high. Machine-tool makers were booked up for eight months and textile machinery makers for five or six months. The difficulties were due to the shortage of raw materials. By the beginning of 1950 there was a lack of non-ferrous metals, tar derivatives and cellulose. A little later, shortages of ferrous metals (particularly of rolled steel) were experienced, and black and grey markets began to grow. But the root of the problem lay in the shortage of coal, which Germany attributed to the exports ordered by the Ruhr authority. The shortage of coal meant not only a deficiency of power but also of raw material for the chemical industry.

In Italy, the economic basis was rather similar to that existing in Germany: both countries relied largely on industry and both were dependent on imports of raw materials. The buying rush for consumer goods soon died down in Italy, and the shortage of raw materials confronted industry. The coal crisis, however, was less acute than in Germany, for the reservoirs were full and there was an abundance of hydro-electric power. Industrial output increased and in June 1951 was 14% higher than a year earlier. More iron and steel were produced, and Italy reached fourth place among the ship-building nations. In both countries, reconstruction, helped by U.S. aid, contributed to improved business conditions.

Among producers of raw materials the price curve took a form similar to that assumed in the highly industrialized countries, but for different reasons. Prices in the producer countries rose because the individual producers of raw materials could bid heavily for consumer goods. This inflationary trend was aggravated because exports of raw materials were not entirely paid for by imports of goods, but either by imports of gold or by allowing the customer countries to owe money. The outflow of goods, coupled with a stable or increased volume of currency, naturally had an inflationary effect. In the producer countries prices rose, generally from excess of currency; in the consumer countries they rose from shortage of raw materials.

The inflationary development could be seen very clearly in Malaya. During the first half of 1951 the average price of rubber was about 125% above the figure for the same period in 1950, and similar conditions existed for tin. The result was a violent currency inflation, the volume of the note issue being nearly doubled. There was a boom, but its foundations were extremely vulnerable.

A less extreme position existed in Australia—a large consumer of raw materials (and of the finished goods resulting from them) as well as a producer. After a busy Christmas season, retail sales continued to be high, partly from a desire to hoard and partly from the impact of the summer holiday season. The resulting upward trend in prices was strengthened by a shortage of goods. This, in turn, had two causes: a shortage of raw materials, such as coal, steel and leather, and the relatively low output of labour. A further

reinforcement came from the grant of higher basic wages. This inflationary factor was enhanced by the enormous size of the annual wool cheque. These rather feverish conditions lasted several months longer than in the United States. One striking effect of the boom could be seen in the high and rising rates of domestic refrigerator production. To some extent, the boom was controlled by the government's dearer credit policy, and hence the reaction in early autumn was milder than it would otherwise have been. The break in the price of wool at the autumn auctions was soon followed by a partial recovery, and business remained healthy.

Conditions in Sweden—another highly industrialized producer of raw materials—followed a similar course to that noted in Australia. Large exports, at high prices, of timber, a raw material of world-wide importance, turned the terms of trade in favour of Sweden, but this improvement did not suffice to provide the country with all the raw materials it needed. Early in 1951, difficulties were experienced in buying all the coal and coke needed, as well as certain kinds of iron and steel and textiles. Later, difficulties were found in acquiring some of the alloys used in steel-making and there were shortages in steel sheets, wire rods and coal. Poland is normally Sweden's chief supplier of coal, and the shortage of Polish coal indicated that the Soviet group of states was suffering from the same problems as the rest of the world.

Conditions in the great raw-material producing countries in South America illustrated the way in which political factors affected business. In Brazil, where the government fostered industrial expansion, developments resembled those in Australia. Cotton markets were firm at the beginning of 1951, reached a peak in March and had declined by about 42% at the end of June. The market in coffee, though its statistical position was healthier than that for cotton, also showed a progressive weakening. But these deflationary tendencies were partially compensated for by industrial developments. In spite of the importance of the rubber-growing industry in Brazil, the consumption of rubber exceeded production, and the iron and steel industry continued to expand. In February, a consignment of Brazilian pig-iron was sent to the United States—a small, but symptomatic, transaction.

In Argentina, though the economic basis closely resembled that of Brazil, differences were brought about by a different governmental policy. The major fluctuation in the prices of raw materials followed the same curve in Argentina as elsewhere, but the tight control over the economy, dictated by political principles, had a special effect. For instance, the desire to maintain a high average standard of living brought about a reduction in meat exports. The export trade was hampered, and the country's economy weakened.

Among the minor states of South America, the general long-term trend towards higher industrialization and output combined with stimulus provided by the demand for raw materials. This could be noted in countries such as Chile, Venezuela and Colombia. The development of prices, on the other hand, was different in different countries, presenting a typically inflationary picture in Chile and one of stability in Venezuela.

In Japan, where the after-effects of war were still strong, the economy was particularly sensitive to the violent fluctuations in prices connected with the Korean war. During the first half of 1951 a boom, culminating about March, was started by the placing of armament orders connected with this campaign; but production costs were high—ultimately a reflection of the country's impoverished state—and some important orders for cotton textiles were cancelled on the ground of costs. The silk trade, too, failed to recover its markets in the U.S. and Great Britain. The heavy increase

in the note circulation was another indication of indigence—this time on the part of the government. Meanwhile, the long-term trend towards recovery, coupled with industrialization, continued, and there were great increases in the output of pig iron, crude steel and cotton yarn and fabrics. By and large, the progress towards recovery was more important than the fluctuations in prices.

Towards the end of 1951, signs that a slump might be starting began to dwindle. In the U.S., inventories continued to grow, but so did savings. In such a situation consumer buying was bound to start again sooner or later. A position like that in 1949, when a U.S. depression began to spread eastwards, did not seem likely to recur. Moreover, although the U.S. balance of payments again became more favourable (which meant that dollars became scarcer), the absolute volume of purchases grew. In autumn, the prices of a number of raw materials, such as wool, cotton and tin, began to rise again. The rise in the price of Australian wool was caused by U.S. (as well as French) buying, and that of cotton by the withholding of stocks by U.S. growers, a process made possible by the administration's price-supporting policy. The general outlook pointed towards rising prices, scarcities and lively business, but there was no reason for expecting that the national experiences would be uniform. (W. H. JN.)

BUTLER, RICHARD AUSTEN, British politician (b. Attock Serai, northern India, Dec. 9, 1902), was educated at Marlborough college and Pembroke college, Cambridge. From 1929 he represented Saffron Walden, Essex, in the House of Commons. In 1931 he became parliamentary secretary to the secretary of state for India and Burma (Sir Samuel Hoare) and in 1932 went to India as a member of the franchise committee; as under secretary of state at the India office he was responsible for much of the work on the Government of India act, 1935. He was parliamentary secretary to the Ministry of Labour from 1937 to 1938 and afterwards under secretary of state at the Foreign Office.

In July 1941 he obtained his first full ministerial appointment when he became president of the Board of Education. He set out on a reconstruction of Great Britain's education system, and in July 1943 issued his white paper on education. After its publication, he and his junior minister, James Chuter Ede, travelled all over Great Britain examining reactions to the proposals. In Aug. 1944, the Education act was passed giving effect to the changes. In the caretaker government, June-July 1945, Butler served as minister of labour. When the Conservative government went out of office after the 1945 election, Butler became chairman of its advisory committee on policy and political education and also of its research department. He played a leading part in drawing up party statements on policy including "The Right Road for Britain" and "This is the Road." He was chairman of the industrial policy committee which produced the "Industrial Charter." In Winston Churchill's government of 1951 he became chancellor of the exchequer.

BYELORUSSIA. A republic formed on Jan. 1, 1918, and incorporated in the Union of Soviet Socialist Republics on Dec. 30, 1922. It is bounded N. by Latvia, E. by Russia, S. by the Ukraine and W. by Poland and Lithuania. Area: (before Sept. 17, 1939) 49,022 sq.mi.; (after the treaty of Aug. 16, 1945, delimiting a new Soviet-Polish frontier) 80,154 sq.mi. Pop.: (Jan. 1939 census) 5,567,976; (Nov. 1939 est.) 8,810,000, including 5,912,500 (67·2%) Byelorussians, 1,408,160 Poles, 737,240 Jews and 454,600 Russians; (March 1950 est.) 9,300,000. Religion (Nov. 1939 est.): Greek

Orthodox 71%, Roman Catholic 20%, Jewish 8%. Chief towns (1939 census): Minsk (cap., 238,772); Vitebsk (167,424); Gomel (144,169). Chairman of the presidium of the Supreme Soviet of the Byelorussian Soviet Socialist Republic, Vasily Ivanovich Kozlov; chairman of the council of ministers, Aleksey Efimovich Kleshchev.

History. At the election of Feb. 25 to the Supreme Soviet of the Byelorussian S.S.R. 4,796,080 (99·99%) out of a possible 4,796,349 electors cast their votes: only 3,812 electors (0·08%) voted against the Communist and non-party bloc. Leading name among the Byelorussian candidates was that of Nikolay Semenovitch Patolichev, a Russian, former member of the Orgburo, sent from Moscow to succeed Nikolay Ivanovich Gusev as first secretary of the Byelorussian Communist party.

Speaking in Moscow on March 9 Kleshchev, the prime minister, claimed that industry in the republic had fulfilled the postwar five-year plan and had exceeded it in certain fields. In 1950 the volume of industrial output reached the index number 562 (1945=100), considerably surpassing the 1940 volume of industrial production. The output of metal-working industries was double that of 1940 owing particularly to the establishment of such new branches of industry as the Minsk automobile plant and the Minsk, Vitebsk and Gomel machine-tool plants. Extraction of peat, which furnished three-quarters of the republic's fuel, substantially increased.

According to M. V. Zimyanin, a Byelorussian deputy to the Soviet of the Union, by 1951 some 436,000 dwellings had been built for collective farmers and people were no longer compelled to make their homes in dugouts as they had been up to 1950. During the postwar five-year plan the construction was begun of 4 million sq.m. of urban housing accommodation. Zimyanin gave no indication how much had been completed, but in Minsk and other principal Byelorussian towns there was a good deal of house-building and restoration. In *Izvestia* on June 14 Evgheny Kriger described Minsk, visited after a seven years' interval, as unrecognizable: there were new squares and 200 new streets. In the same paper on Sept. 18, Konstantin Naumovich Dlugoshevsky, chairman of the executive committee of the Minsk city council, complained that the construction of new houses was too slow and uneconomical. During 1946-50 state organizations and enterprises had built 460,000 sq.m. of floor living-space in Minsk, comprising 350 brick dwellings of 20 flats or under; 80 more of these houses were being built. To end such wasteful dispersion of manpower and building materials Dlugoshevsky called for the construction of larger apartment-blocks. During 1951 the city council completed two such houses, one of 124 flats and another with 115, after 18 months' work; a third house of 106 flats was under construction.

Kondrat Krapiva, a playwright, addressing in April a meeting of Byelorussian writers at Minsk on the importance of Stalin's linguistic theory for Byelorussian literature, said that it was their duty to remove from their language all artificial barriers by which bourgeois nationalists tried to separate the Byelorussian from the Russian.

Education. Schools (1950): elementary and secondary 11,789, pupils 1·5 million; technical 110; institutions of higher education 28, students 16,000.

Finance. Budget (1951 est.): balanced at Rb. 3,687 million.

(K. SM.)

CABINET MEMBERS. The following changes were made in C. R. Attlee's cabinet between Jan. 1, 1951, and the general election, Oct. 25, 1951.

<i>Post</i>	<i>Name</i>
Secretary of State for Foreign Affairs	*Herbert Stanley Morrison (from March 9)
Lord President of the Council and Leader of the House of Lords	†Viscount Addison (from March 9)

CABINET MEMBERS

<i>Post</i>	<i>Name</i>	<i>Post</i>	<i>Name</i>
President of the Board of Trade	Sir Hartley William Shawcross (from April 24)	Minister of Agriculture	James Garfield Gardiner
Lord Privy Seal	†Ernest Bevin (March 9-April 14) Richard Rapiet Stokes (from April 27)	Minister of Public Works	Alphonse Fournier
Minister of Labour and National Service	*Aneurin Bevan (Jan. 17-April 23) Alfred Robens (from April 24)	Minister of National Defence	Brooke Claxton
<p>(The Minister of Health was no longer in the cabinet after the appointment of Hilary Adair Marquand on Jan. 17. The title of Minister of Town and Country Planning was changed to that of Minister of Local Government and Planning from Jan. 17).</p> <p>The following is a list of cabinet members of Great Britain and the other members of the Commonwealth of Nations on Dec. 31, 1951.</p>			
Great Britain			
Prime Minister, First Lord of the Treasury and Minister of Defence	*Winston Leonard Spencer Churchill	Minister of National Health and Welfare	Paul Joseph James Martin
Secretary of State for Foreign Affairs	*Robert Anthony Eden	Minister of Finance	Douglas Charles Abbott
Lord President of the Council	*Lord Woolton	Minister of National Revenue	James Joseph McCann
Lord Privy Seal	*The Marquess of Salisbury	Minister without Portfolio	Wishart McLea Robertson
Lord Chancellor	Lord Simonds	Minister of Labour	Milton Fowler Gregg
Secretary of State for the Home Department and Minister for Welsh Affairs	*Sir David Patrick Maxwell Fyfe	Minister of Fisheries	Robert Wellington Mayhew
Chancellor of the Exchequer	*Richard Austen Butler	Secretary of State for External Affairs	Lester Bowles Pearson
Secretary of State for Commonwealth Relations	General Lord Ismay	Minister of Justice and Attorney General	Stuart Sinclair Garson
Secretary of State for the Colonies	Oliver Lyttelton	Minister of Resources and Development	Robert Henry Winters
Secretary of State for Scotland	James Gray Stuart	Secretary of State of Canada	Frederick Gordon Bradley
Secretary of State for the Co-ordination of Transport, Fuel and Power	Lord Leathers	Minister of Veterans' Affairs	Hugues Lapointe
Minister of Health	Harry Frederick Comfort Crookshank	Postmaster General	Gabriel Edouard Rinfret
Minister of Labour and National Service	Sir Walter Turner Monckton	Minister of Citizenship and Immigration	Walter Edward Harris
Minister of Housing and Local Government	Harold Macmillan	Minister of Mines and Technical Surveys	George Prudham
President of the Board of Trade	George Edward Peter Thorneycroft	Ceylon	
Paymaster General	Lord Cherwell	Prime Minister, Minister of Defence and External Affairs and Minister of Health and Local Government	*Don Stephen Senanayake
Australia			
Prime Minister	*Robert Gordon Menzies	Minister of Home Affairs and Rural Development	Sir Oliver Goonetilleke
Treasurer	Sir Arthur William Fadden	Minister of Transport and Works	Sir John Kotelawala
Vice President of the Executive Council and Minister for Defence Production	Eric John Harrison	Minister of Finance	Junius Richard Jayewardene
Minister for Labour and National Service and Minister for Immigration	Harold Edward Holt	Minister of Justice	Sir Lalita A. Rajapakse
Minister for Commerce and Agriculture	John McEwen	Minister of Agriculture and Lands	Dudley Shelton Senanayake
Minister for External Affairs	*Richard Gardiner Casey	Minister of Education	Edward Alexander Nugawela
Minister for Defence	Philip Albert Martin McBride	Minister of Food and Co-operative Undertakings	Abeyratne Ratnayake
Minister for Health	Sir Earle Christmas Grafton Page	Minister of Posts and Telecommunications	Cathiravelu Sittampalam
Minister for Trade and Customs	Neil O'Sullivan	Minister of State	A. E. Goonesinha
Minister for Shipping and Transport	George McLeay	Minister of Industries, Industrial Research and Fisheries	Ganapathipillai Gangesar Ponnambalam
Postmaster General and Minister for Civil Aviation	Hubert Lawrence Anthony Josiah Francis	Minister of Commerce and Trade	Henry Woodward Amarasuriya
Minister for the Army	John Armstrong Spicer	Minister of Labour and Social Services	M. D. Banda
Attorney General	William Henry Spooner	India	
Minister for National Development	Walter Jackson Cooper	Prime Minister and Minister for External Affairs	*Jawaharhalal Nehru
Minister for Repatriation	Howard Beale	Minister for Education	Maulana Abul Kalam Azad
Minister for Supply	Wilfred Selwyn Kent Hughes	Minister for Home Affairs and Law	K. N. Katju
Minister for the Interior and Minister for Works and Housing	Athol Gordon Townley	Minister for Defence	Baldev Singh
Minister for Social Services	Paul Meernaa Caedwalla Hasluck	Minister for Labour	Jagjivan Ram
Minister for Territories	William McMahan	Minister for Health and Communications	Rajkumari Amrit Kaur
Minister for the Navy and Minister for Air		Minister for Works, Production and Supply	Narhar Vishnu Gadgil
Canada			
Prime Minister and President of the Privy Council	*Louis Stephen St. Laurent	Minister for States, Transport and Railways	Narasimha Gopaldaswami Ayyangar
Minister of Trade and Commerce and Minister of Defence Production	Clarence Decatur Howe	Minister for Commerce and Industry	Harekrushna Mahtab
		Minister for Food and Agriculture	Kanialal Maneklal Munshi
		Minister for Natural Resources and Scientific Research	Sri Prakasa
		Minister for Finance	Chintaman Dwarkanath Deshmukh
		Minister in Charge of Planning	Guljarilal Nanda
		New Zealand	
		Prime Minister and Minister of Finance	*Sidney George Holland
		Minister of Agriculture and Marketing	Keith Jacka Holyoake
		Minister of Labour, Employment, Mines and Immigration	William Sullivan
		Attorney General and Minister of Justice, External Affairs and Island Territories	*Thomas Clifton Webb
		Minister of Education, Broadcasting, and Scientific and Industrial Research	Ronald Macmillan Algie
		Minister of Internal Affairs, Social Security, and Tourist and Health Resorts	William Alexander Bodkin
		Minister of Customs, Associate Minister of Finance	Charles Moore Bowden

Post	Name
Postmaster General and Minister of Telegraphs	Walter James Broadfoot
Minister of Lands, Forests and Maori Affairs	Ernest Bowyer Corbett
Minister of Works, Housing, Hydro-Electricity, Transport and Railways and Marine	William Stanley Goosman
Minister of Defence, Rehabilitation, War Pensions and Civil Aviation	Thomas Lachlan Macdonald
Minister of Supply, Industries and Commerce and Price Control	Jack Thomas Watts
Minister without Portfolio and Minister for the Welfare of Women and Children	Mrs. Grace Hilda Ross
Minister of Health, Information and Publicity	John Ross Marshall
Minister without Portfolio	William Henry Fortune
Pakistan	
Prime Minister and Minister for Defence	*Khwaja Nazimuddin
Minister for Industries	Sardar Abdur Nishtar
Minister for Commerce, Education and Economic Affairs	Fazlur Rahman
Minister for Finance	Mohammed Ali
Minister for Food, Agriculture and Law	Pirzada Abdus Sattar
Minister for Kashmir Affairs, Foreign Affairs and Commonwealth Relations	Mohammad Zafrullah Khan Mahmud Husain
Minister for the Interior, States and Frontier Regions	Mushtaq Ahmad Gurmani
Minister for Refugees and Rehabilitation, Information and Broadcasting	Ishtiaq Husain Qureshi
Minister for Minorities	Azizud-din Ahmad
Minister for Communications	Sardar Bahadur Khan
Minister for Health, Works and Labour	A. M. Malik
<p>In the absence abroad, at the end of 1951, of Zafrullah Khan, Mahmud Husain relinquished his portfolios of defence, states and frontier regions to become acting minister of foreign affairs and Commonwealth relations.</p>	
South Africa	
Prime Minister and Minister of External Affairs	*Daniel François Malan
Minister of Finance	Nicolaas Christian Havenga
Minister of Lands and Irrigation	Johannes Gerhardus Strydom
Minister of Justice	Charles R. Swart
Minister of Transport	Paul Oliver Sauer
Minister of Agriculture	S. P. le Roux
Minister of Economic Affairs	Erik Hendrik Louw
Minister of the Interior	Theophilus Ebenezer Dönges
Minister of Defence	François Christiaan Erasmus
Minister of Labour, Public Works and Forestry	Berend Jacobus Schoeman
Minister of Posts and Telegraphs	Jozua François Tom Naudé
Minister of Native Affairs	H. F. Verwoerd
Minister of Education, Arts and Sciences and Mines	Johannes Hendrikus Viljoen
Minister of Health and Social Welfare	Karl Bremer
Southern Rhodesia	
Prime Minister and Minister of Defence	Sir Godfrey Martin Huggins
Minister of Finance, Posts and Telegraphs	Edgar Cuthbert Fremantle Whitehead
Minister of Internal Affairs and Justice	Julius MacDonald Greenfield
Minister of Mines, Transport and Education	George Arthur Davenport
Minister of Agriculture and Lands	John Moore Caldicott
Minister of Trade and Industrial Development	William Alexander Eustace Winterton
Minister of Native Affairs and Minister of Health	Patrick Bisset Fletcher

CAMBODIA: see INDOCHINA.

CAMBRIDGE UNIVERSITY. During 1951 Cambridge had an unusual number of distinguished visitors. At the beginning of the Easter term the King and Queen, with Princess Margaret, visited King's college and attended a service of thanksgiving to commemorate the restoration of the college chapel to its ancient beauty. Early in July the Queen and other members of the royal family visited the Royal Agricultural show, last held in Cambridge in 1922, and to mark the opening of the show the honorary degree of doctor of law was conferred upon the Princess Royal. In August, during the celebrations of the Festival of Britain in Cambridge, the Duke and Duchess of Gloucester visited a magnificent exhibition of college and civic plate, in the Fitzwilliam museum.

In June the university welcomed Lord Tedder as its new chancellor, elected in the preceding November. He was formally installed in the senate house on June 7, and among those who received honorary degrees at his hands were General Omar Bradley, Dame Edith Evans, and Rose Macaulay.

At a time when private benefactions had inevitably to be infrequent the university was fortunate in receiving from the British Electrical and Allied Manufacturers' association a permanent endowment for the professorship of electrical engineering which had been established as a result of an offer made in 1944 by the Institute of Electrical Engineers

Marshal of the Royal Air Force Lord Tedder leading the procession from the south door towards the gate of the Senate House yard after his installation as chancellor, June 7, 1951.

to provide the stipend of a professor for a period of five years. Another notable benefaction was likely to come to the university from a public appeal launched in June for a fund to establish a professorship in commonwealth studies in memory of General Jan Smuts (d. 1950). In October, of the £150,000 for which this appeal was made some £137,000 had already been subscribed. In October a new professorship, the second chair of economics, came into being, and R. F. Kahn was appointed the first professor.

The year was not notable for new building, but it saw the beginning, at long last, of the block of chemical laboratories on the Lensfield site, and substantial progress was made with the new engineering laboratory. In October the Department of Human Ecology moved to its new quarters at Fenner's, which also housed the university health service. One of the first activities of the new department was a project of research into the development of medical care in East Anglia—a piece of work made possible by a generous benefaction from the Nuffield trustees. Other substantial grants came from the trustees of the Rockefeller foundation, for the promotion of important work in chemistry, physics, biochemistry and criminal science.

Professor Sir Lionel Whitby, master of Downing college, succeeded S. C. Roberts as vice chancellor on Oct. 1, and there were two changes of college headship—the retirement of G. M. Trevelyan from the mastership of Trinity and the appointment by the crown of Professor E. D. Adrian as his successor, and the retirement because of ill health of T. S. Hele from the mastership of Emmanuel and the election of Edward Welbourne in his place.

The number of students in residence during the academic year 1950-51 showed a small decrease. The total was 7,891: of these 7,182 were men and 709 women; 747 were registered research students. (See also UNIVERSITIES AND COLLEGES.)

CANADA. Self-governing member of the Commonwealth of Nations, covering all North America north of the United States except Alaska. Canada is a federal union under the terms of the British North America act (1867).

Language (1941): English (49·7%), French (30·3%), German (4%), Ukrainian (2·6%), Scandinavian (2·1%), Dutch (1·9%), Yiddish (1·5%), Polish (1·5%), other (6·2%). Religion (1941): Roman Catholic 4,800,895, United Church

of Canada 2,204,875; Church of England 1,751,188; Presbyterian 829,147; Baptist 483,592; Lutheran 401,153; Greek Catholic 185,657; Greek Orthodox 139,629; Jewish 168,367; other 542,152. Chief towns (pop., 1951 census; first figure, city proper; second figure, metropolitan area): Ottawa (cap., 198,773; 278,078); Montreal (1,002,703; 1,370,044); Toronto (1948 est., 695,302); Vancouver (340,272; 524,339); Winnipeg (233,617; 350,924); Quebec (161,439; 271,236); Edmonton (158,709; 172,112); Calgary (126,631; 136,719). Governor general, Viscount Alexander of Tunis; prime minister, Louis Stephen St. Laurent (*q.v.*).

History. The year opened on a buoyant note, for although prices and the cost of living continued to rise and competing defence and civilian claims created a serious manpower problem, industrial expansion was at a high level and the nation's potential wealth continued to grow by leaps and bounds. Foreign capital flowed in for investment, and a large proportion of the funds which entered during Aug.-Sept. 1950 in expectation of a rise in the Canadian exchange rate remained. Exploration and development of the country's vast natural resources supported the view that before the end of the century Canada would be one of the richest nations in the world. The output of crude oil from Alberta created new records, and it was estimated that more than one-third of Canada's consumption of oil would soon be supplied from domestic sources, thus effecting a considerable saving on imports from the United States. Extension of hydro-electric power schemes and irrigation projects increased both industrial and agricultural production. A bumper wheat crop was for the second year in succession affected by bad weather.

During the year Canada's defence programme was expanded and accelerated, and a Department of Defence Production set up to act as a procurement agency and to allocate essential materials. In February the minister of national defence, Brooke Claxton, outlined in the House of Commons a three-year programme which would put into commission 100 ships for the navy, 40 regular and auxiliary squadrons for the air force and certain additions to the army, at a cost of \$5,000 million over the period. Expenditure for 1951 would be about \$1,600 million. The objectives were the defence of Canada and the North American continent from direct attack; carrying out of commitments to the North Atlantic Treaty organization (N.A.T.O.) and the United Nations; organization to build up the nation's strength in the event of total war. Claxton referred to the close correlation of Canada's defence measures with those of the United States. Canada's main contribution to N.A.T.O. would be an air

OCT. 7. Princess Elizabeth and the Duke of Edinburgh left London airport in a B.O.A.C. strato-cruiser at 11.30 P.M., G.M.T., (12.30 A.M., B.S.T., Oct. 8).

Oct. 8. The royal plane reached *Gander*, Newfoundland, at 9.50 A.M., G.M.T., thence proceeding to *Montreal*, where it touched down at Dorval airport at 12.50 P.M. The princess and the duke were met by Viscount Alexander of Tunis and L. S. St. Laurent and boarded the royal train for *Quebec*.

Oct. 9. The princess and the duke arrived at Wolfe's Cove, *Quebec*, in the morning. Welcomed by large crowds, they were personally greeted by Gaspard Fauteux, lieutenant-governor of Quebec, and his wife; they then drove to the parliament buildings where members of the legislative council and their wives were presented and to Laval university where they were received by Mgr. M. Roy, archbishop of Quebec and chancellor of the university. They signed the golden book and deans of faculties were then presented. The princess reviewed le régiment de la Chaudière, on the Citadel. She and the duke attended a state banquet in the evening at the Château Frontenac, followed by a concert, after which they boarded the royal train for *Ottawa*.

Oct. 10. In the morning they arrived in *Ottawa* and were greeted by Viscount Alexander, the prime minister and Mrs. St. Laurent and the mayor of Ottawa, Miss Charlotte Witton. After the princess had inspected a guard of honour and received officials and their wives, she and the duke drove to Lansdowne park, where they were greeted by 13,000 schoolchildren singing the anthem "O Canada," and later laid a wreath on the national war memorial. In the afternoon, after a visit to *Hull*, Quebec province, the princess presented Queen Mary's carpet to the National Gallery of Canada. At a state dinner at Government house, she replied in English and French to the governor general's toast.

Oct. 11. After a quiet day, with a trip on the Ottawa river and an evening party at Government house with square dancing, the royal couple boarded their train for *Toronto*.

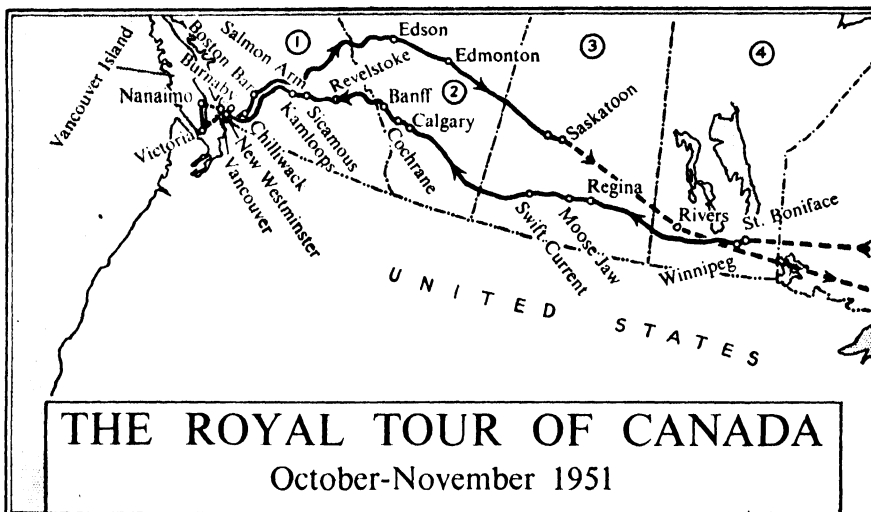

Oct. 12. Having stopped for brief ceremonies of welcome at *Cornwall*, *Brockville*, *Kingston* (where they visited the royal military college), *Belleville* and *Trenton* (where they visited the R.C.A.F. station), they arrived at *Toronto* in the evening. They received a tremendous welcome and, after being greeted by Lieut. Col. R. Lawson, the lieutenant-governor of Ontario, attended a reception at the city hall where Princess Elizabeth was presented with pictures by Canadian artists.

Oct. 13. The princess reviewed a march-past of cadets, and afterwards recipients of the Victoria Cross were presented. At luncheon, the duke addressed an audience of 1,700 members of the Toronto Board of Trade and, in the afternoon, the princess and he saw a parade of 50,000 children at Riverdale park. After an official dinner at the Royal York hotel they boarded the train.

Oct. 14. They visited Niagara falls in the morning, the duke observing the falls through a pair of "dime" binoculars. In the afternoon they left in their train for *Windsor*, Ontario, having called briefly at *St. Catharines*, *Hamilton*, *Brantford*, *Woodstock*, *London* (where they signed the city register) and *Chatham*, Ontario.

Oct. 15. At *Windsor*, Ontario, thousands of Americans watched the royal couple from across the Detroit river. The princess addressed schoolchildren at Jackson park and, with the duke, visited the Ford motor works. They left for *Winnipeg* in an R.C.A.F. plane.

Oct. 16. The princess and the duke arrived at *Winnipeg*, Manitoba, having spent the night at *Kapuska*, Ontario, where they toured the town. A guard of honour met them at the

airport, and thousands of people who had come from all over Manitoba greeted them. After a civic luncheon, their royal highnesses, during a tour of the city, visited districts flooded by the Red river in 1950. At a reception at the legislative chamber the princess thanked the premier of Manitoba for a cheque presented to her earlier in the day as a gift for charity. In the evening a local ballet company gave a performance.

Oct. 17. The royal train arrived at *Regina*, Saskatchewan, the training h.q. of the Royal Canadian Mounted police. The princess replied, in the legislative building, to an address of welcome by T. C. Douglas, premier of Saskatchewan, and later their royal highnesses received gifts for themselves and their children. In the afternoon, they watched an entertainment in the Exhibition grounds, where displays by children included Ukrainian and Scottish dances; they visited the R.C.M.P. barracks. In the evening the royal train made brief stops at *Moose Jaw* and *Swift Current*, Saskatchewan.

Oct. 18. After arriving at *Calgary*, Alberta, in the morning, the princess and the duke visited an Indian village, where more than 1,000 Indians, headed by many chiefs, met them and presented them with a doeskin Indian costume for Princess Anne. Before a "chuck waggon" lunch of beef stew, grass salad and blueberry tart, the royal couple spoke to a group of crippled and injured scouts, cubs, guides and brownies, and in the afternoon watched a stampede.

Oct. 19. The train crossed the Rocky mountains (of which, because of snow, the princess and the duke had only a restricted view) on its way to *Vancouver*, British Columbia. Brief stops were made at *Cochrane*, *Banff* (where a 25-lb. lake trout was presented), *Revelstoke*, *Sicamous*, *Salmon Arm*, and *Kamloops*, where the princess reviewed veterans of the South African War.

Oct. 20. The train arrived at *Vancouver* in the morning and, during a day in which there was no elaborate ceremony, the princess and the duke watched a demonstration of American football at British Columbia university, and a folk-dancing display. In Queen Elizabeth park, the princess planted an oak tree from Windsor park, England, and later the duke paid an unofficial visit to H.M.C.S. "Discovery."

Oct. 21. After attending service at Christ-church cathedral, Vancouver, the princess and the duke sailed down Georgia strait in H.M.C.S. "Crusader" to *Victoria*, Vancouver island, where they arrived in the evening.

Oct. 22. They watched a demonstration by Indians of traditional dances in Thunderbird park, *Victoria*. At a luncheon given by the provincial government, the princess replied to a speech of welcome by Byron Johnson, premier of British Columbia, who had presented the princess and the duke with gifts.

Oct. 23. After travelling 8,000 mi. in a fortnight, their royal highnesses enjoyed a day of relaxation at *Victoria*.

Oct. 24-25. They spent a two-day holiday at *Eagle's Crest*, Vancouver island.

Oct. 26. The princess and the duke left

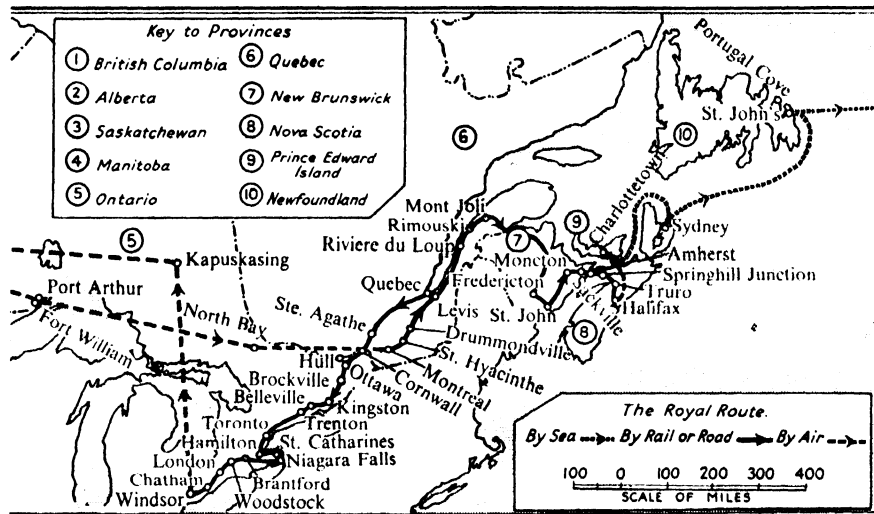

Arriving at Dorval airport.

Driving the royal train.

Arriving at the Citadel, Quebec.

Vancouver island in H.M.C.S. "Crusader" from the port of Nanaimo in the morning. They boarded their train at Vancouver and left for Edmonton, Alberta, stopping for brief ceremonies of welcome at Burnaby, New Westminster, Chilliwack, Boston Bar, British Columbia, and Edson, Alberta. The princess drove the train for 14 mi.

Oct. 27. They arrived at Edmonton, Alberta, the northernmost point of their tour, where the princess inspected a guard of honour and, at the legislative buildings, was presented, by E. C. Manning, premier of Alberta, with a bearskin rug and gifts for her children. After visiting the oil refinery the princess and the duke attended a dinner given by the lieutenant governor of Alberta and his wife and then watched a floodlit football match. The royal train left at midnight.

Oct. 28. The train arrived at Saskatoon, Saskatchewan. The princess and the duke attended a service at St. John's cathedral and at midday left by air for Rivers, Manitoba, arriving in the afternoon. After a ceremony of welcome they proceeded by air to Port Arthur, Ontario, via Fort William.

Oct. 29. They reached Port Arthur by air and there visited the world's largest grain elevator before returning by car to Fort William and attending a reception at the city hall auditorium. At midday, they flew to North Bay, Ontario, where, after being greeted by the mayor and officials and speaking to the Dionne quintuplets, they made a tour of the city and then proceeded by air to Montreal. They at once drove to the city and were welcomed by 250,000 people in Dominion square.

Oct. 30. In the morning the princess and the duke visited McGill university, Montreal, where they were greeted by students and received by the chancellor, Chief Justice O. S. Tyndale, and the principal, F. C. James. At the Molson stadium, the princess and the duke were welcomed by 12,000 English-speaking Montreal schoolchildren and, at the Stade Delorimier, by as many French-speaking children. After visiting the dock area of Montreal and inspecting the first Canadian destroyer escort under construction, the princess, in the afternoon, visited the French-speaking University of Montreal, where she was greeted by the chancellor, Mgr. P. E. Leger, archbishop of Montreal. Later, the princess and the duke attended a reception at the city hall and were presented with a worked map of the city. In the evening, a gala dinner was given by the mayor of Montreal.

Oct. 31. The princess and the duke flew to Washington where they were met by President Harry S. Truman and his wife and daughter. After a ceremonial drive to Blair house, their

royal highnesses attended a reception given by Washington correspondents and, later, a dinner given by the president at Blair house.

Nov. 1. The princess and the duke drove to Mount Vernon and laid a wreath on George Washington's tomb and later laid a wreath on the tomb of the unknown soldier at Arlington cemetery. They gave a reception at the Canadian embassy to Commonwealth ambassadors and staffs and, later, attended a reception

With an Indian Chieftain at Calgary.

Saying good-bye to the train crew.

at the British embassy given by the ambassador, Sir Oliver Franks. In the evening, their royal highnesses gave a dinner at the Canadian embassy for President and Mrs. Truman.

Nov. 2. The princess and the duke flew back to Montreal after a morning sight-seeing tour of Washington followed by a farewell visit to Blair house, where the princess presented President Truman with an 18th-century overmantle as a gift from King George VI.

Nov. 3-4. The princess and the duke spent a two-day holiday in the Laurentian Mountains in the vicinity of Ste. Agathe.

Nov. 5. In the evening they arrived by train at Mont Joli, province of Quebec, on the last lap of their tour, having stopped during the day at St. Hyacinthe, Drummondville, Levis, Rivière du Loup and Rimouski (where the princess was given a coloured vase made from the clay of Rimouski river).

Nov. 6. Having travelled through the night, the royal train arrived at Fredericton, New Brunswick, in the morning. After an informally friendly welcome, the royal couple visited the University of New Brunswick. At a reception at the legislative buildings, the premier of New Brunswick presented them with locally woven motoring rugs. After a luncheon given by the province they left by train for Saint John, New Brunswick, where a huge crowd broke through the station barrier and sang "O Canada." In the evening, the mayor gave a dinner on behalf of the city, after which the royal visitors left by train.

Nov. 7. The princess and the duke arrived at Halifax, Nova Scotia, having stopped briefly at Moncton, Sackville, Amherst, Springhill Junction and Truro on the way. They were greeted by J. A. D. McCurdy, lieutenant governor of Nova Scotia, and attended a reception in the legislative building.

Nov. 8. The princess and the duke made a tour of the naval dockyard and later the duke replied to the toast at a luncheon given by the city of Halifax. They visited the naval museum and the naval training school and in the evening attended a dinner given by the provincial government at which the premier, A. L. MacDonald, presented gifts.

Nov. 9. After travelling through the night the princess and the duke arrived at Charlottetown, Prince Edward Island, and drove to the legislative buildings and met officials, after which the princess was presented with a pearl platinum fox cape (the island was the original home of fox furs) and a \$1,000 cheque for charity by the premier, J. Walter Jones. Late at night, after a government dinner at the Charlottetown hotel, the royal couple left in H.M.C.S. "Ontario" for Cape Breton Island.

Nov. 10. In the morning they disembarked at Sydney, Cape Breton Island.

Nov. 11. They arrived by sea at St. John's, Newfoundland. In the morning, the princess laid a wreath on St. John's war memorial at an armistice-day parade and, in the evening, made a farewell broadcast to the people of Canada at government house through the golden microphone used by King George VI in 1939.

Nov. 12. The princess and the duke drove, in the morning, to Portugal Cove, where they were taken out to the liner "Empress of Scotland." Shortly after midday they sailed for England accompanied by Assistant Commissioner M. F. E. Anthony of the R.C.M.P. and four R.C.M.P. orderlies.

Nov. 17. The princess and the duke disembarked at Liverpool and travelled by train to London, where they were met by the queen, Princess Margaret and Prince Charles.

Nov. 19. Princess Elizabeth and the Duke of Edinburgh drove through the City to Guildhall where they were officially welcomed back by the lord mayor, Sir Leslie Boyce, and the prime minister, Winston Churchill.

Continued from page 121.

division of 11 squadrons, one of which was already in the United Kingdom.

Further contributions to N.A.T.O. and the United Nations were an air training plan which included aircrew from Europe; an infantry brigade group for the integrated forces under General Dwight D. Eisenhower's command, to be stationed in Germany; an infantry brigade group provided for the Commonwealth division of the U.N. forces in Korea. Destroyers of the Royal Canadian navy and a transport squadron of the R.C.A.F. took part in the Korea campaign.

Canadian industry steadily expanded its defence production, especially in aircraft. The Orenda, first jet engine to be developed in Canada, was flown in the R.C.A.F. all-weather fighter CF100. In Montreal, F86A Sabre jet aircraft were produced in quantity and training planes of a new and advanced type were manufactured. A wide range of metals were declared "essential" under the provisions of the Essential Materials act.

To meet the heavy demands on manpower caused by the rearmament drive, the government launched an accelerated programme of selective immigration, and by directing essential materials into defence industries automatically diverted the flow of labour from civilian employment. A National Advisory Council on Manpower was set up. An Emergency Powers act authorizing the government to resume the authority for controls, gradually abolished after the war, was passed in March.

Canada signed the peace treaty with Japan on Sept. 8. Lester B. Pearson, secretary of state for external affairs, described it as both generous and realistic. Events of the past 20 years had shown that Canada could not isolate herself from wars or threats of war in the Pacific, for geographically Canada was a Pacific as well as an Atlantic power.

The budget proposals, introduced on April 10, were based on an assumption that the gross national production in 1951 would reach \$20,000 million, an increase of about 12% over 1950. It was an anti-inflationary, "pay as you go" budget, with surcharges on the existing tax schedules but no fundamental alteration in the tax structure. Revenue for 1951-52 was estimated at \$3,730 million, as compared with \$3,105.3 million the previous year; expenditure at \$3,700 million, as compared with \$2,901.8 million, a high level for peacetime. Of this, \$1,664 million was for defence.

There was a marked increase in Canada's external trade during the first eight months of 1951. During this period exports were valued at \$2,494.7 million, compared with \$1,965.5 million the previous year. Imports were \$2,830.5 million, compared with \$1,979.8 million. Trade with both the United Kingdom and the United States increased substantially. In sales to western nations there was a greater emphasis on strategic materials.

The 1946-50 Anglo-Canadian Wheat agreement, which terminated in 1950, gave rise to controversy in the Canadian House of Commons, the grain-growers claiming compensation for losses they believed they had sustained under the agreement. The \$65 million offered by the Canadian government was considered inadequate. The United Kingdom agreed to purchase from Canada in the crop year beginning Aug. 1951 95 million bu. of wheat, and 350,000 tons of flour. These purchases were made within the framework of the International Wheat agreement. Additional quantities might be purchased outside the terms of the agreement on the free market.

A financial agreement was signed with the United Kingdom on June 29, by which the interest-free provision of the 1942 loan from Canada to Britain was continued to Jan. 1, 1954.

In July, a U.S. Congressional committee rejected proposals for the joint development of the St. Lawrence seaway by the Canadian and U.S. governments, as suggested in the agree-

ment of 1941. The Canadian government therefore decided to proceed alone, and announced on Oct. 22 that it would introduce legislation authorizing work on the seaway and power project and the establishment of a federal government agency to administer the work. The government would also request the necessary co-operation from the U.S. government under the treaty on boundary waters.

On Oct. 8, Princess Elizabeth and the Duke of Edinburgh arrived in Montreal by air for a five-week tour of Canada. They visited all the provinces, and were shown the many and varied aspects of the Canadian community and environment. They were greeted everywhere by large and enthusiastic crowds, despite weather which was often adverse. Before the royal couple left Canada on Nov. 12, the princess in a farewell broadcast referred to the warmth of the welcome she had everywhere encountered and said that she had been made to feel that she truly belonged to Canada.

The report of the Royal Commission on the State of Letters, Arts and Science, headed by Vincent Massey, and the part the federal government should play in encouraging them was submitted to parliament on June 1. The creation of a council for the arts, letters, humanities and social sciences was recommended, together with a national museum policy and a national library.

An Old Age Security bill, granting pensions to all over 70 years of age who had resided in Canada for more than 20 years, was passed through the House of Commons in November.

A provincial election in April in Prince Edward Island returned the Liberal party to power. A greater degree of self-government was given to the administrative district of Yukon and also to the Northwest territories. On Nov. 22, Ontario returned to power the Progressive Conservative party. In October, at the opening of the parliamentary session at St. John's, Newfoundland, the lieutenant governor said that never in Newfoundland's history had there been such a high degree of prosperity nor had so high a living standard been enjoyed by the population. On Nov. 26 a provincial election was held in Newfoundland. (C. C.)

Education. Provincially controlled schools (1947-48): ordinary and technical day schools 31,393, pupils 2,091,929, teachers 77,240. Privately controlled schools (1947-48): ordinary day schools 783, pupils 98,103, teachers 5,741; business training day schools 255, pupils 23,023, teachers 1,078. Indian schools (1949-50): 403 (pupils 23,409) including residential 69 (pupils 9,316); day schools 334, pupils 14,093. Universities and colleges (1949): 198, students 116,176, professors and lecturers 10,430.

Agriculture and Fisheries. Main crops ('000 metric tons, 1950; 1951 est. in brackets): wheat 12,565 (15,830); barley 3,732 (5,465); oats 6,476 (7,665); rye 339 (502); maize 352; potatoes 2,641; sugar beets 933; tobacco 54.6 (66.6); soyabeans 90; linseed 115. Livestock ('000 head): cattle on farms (Dec. 1950) 8,292; sheep (Dec. 1950) 1,268; pigs on farms (June 1951) 5,875; horses on farms (June 1950) 1,683; poultry (Dec. 1950) 37,300. Dairy production ('000 metric tons, 1950; 1951, six months, in brackets): milk 7,455 (3,512); butter 118.8 (50.2); cheese 43.7 (14.3). Meat production ('000 metric tons, 1949; 1950 in brackets): total 882 (869), of which beef and veal 449 (415); pork 413 (437); mutton and lamb 20 (16). Agricultural labour force (June 1951): total 1,017,000, of which paid workers 114,000. Fisheries (total catch of sea-fish, 1950; 1951, six months, in brackets): landed weight ('000 metric tons) 604 (240); total value (\$ million) 67.5 (24.8).

Industry. Industrial establishments (1947) 32,734; persons employed 1,131,750. Fuel and power (1950; 1951, six months, in brackets): coal ('000 metric tons) 15,360 (7,382); lignite 1,992 (849); coke 3,998 (1,988); natural and manufactured gas (million cu. m.) 2,782 (1,575); electricity (million kwh.) 50,904 (28,802); crude oil ('000 metric tons) 3,749 (2,569). Raw materials ('000 metric tons, 1950; 1951, six months, in brackets): iron ore, metal content 3,312 (1,306); pig iron 2,256 (1,328); steel ingots and castings 3,072 (1,655); copper, refined 217 (113); lead, refined 155 (78); zinc, refined 186 (97); nickel 112.1 (60.7); synthetic rubber 39.4 (28.7); gypsum, producers' shipments 3,730 (1,385); asbestos, producers' shipments 888.7 (511.5); lime, producers' shipments 1,142.2 (620.7); salt, producers' shipments, commercial 407.2 (207.2), for use in chemicals 465.7 (260.2); feldspar, producers' shipments 32.9 (18.5); gold ('000 fine ounces) 4,452 (2,188); silver ('000 fine ounces) 23,220 (11,086). Manufactured goods (1950; 1951,

six months, in brackets): wood pulp ('000 metric tons) 8,437 (4,598); newsprint ('000 metric tons) 5,363 (2,792); cement ('000 metric tons) 2,652 (1,313); motor vehicles (thousands): cars 285 (177), commercial 106 (71); cotton yarn ('000 metric tons) 96.0 (54.2); woven cotton fabrics (million m.) 291.6 (164.4); worsted yarn ('000 metric tons) 7.2 (3.9); sawn lumber (million bd.ft.) 6,018.4 (3,273.9). Manufactured food ('000 metric tons, 1950; 1951, six months, in brackets): wheat flour 1,872 (1,106); margarine 42.7 (24.9). Index of industrial production (1937=100, 1950; 1951, six months, in brackets): general 184 (200); mining 140 (154); manufacturing 191 (208).

Foreign Trade. Million Canadian dollars (1950; 1951, six months, in brackets): imports 3,180 (2,101); exports 3,156 (1,763). Main sources of imports (1950): U.S. 67%; U.K. 13%. Main destinations of domestic exports (1950): U.S. 65%; U.K. 15%. Main commodities imported (1950): machinery and vehicles 23%; petroleum and products 10%; iron, steel and manufactures 8%; coal, coke and products 6%; cotton and manufactures 5%. Main domestic exports (1950): newsprint 16%; wood and manufactures 13%; wheat 10%; wood pulp 7%; copper and manufactures 3%; nickel 3%. Index of volume of trade (1948=100, 1950): imports 109; exports 94.

Transport and Communications. Railways (1949): steam 42,979 mi., electric 719 mi.; passenger-mi. (1950) 2,804 million; goods, ton-mi. (1950) 50,125 million. Roads (1949) 556,266 mi. including surfaced 150,493 mi. Licensed motor vehicles (Dec. 1950): cars 1,730,000; commercial 550,000. Navigable waterways (1949): 1,890 mi. including canals 509 mi. Shipping (merchant vessels of 100 gross tons and over, including vessels for inland navigation, July 1950): 1,222; total tonnage 2,038,959. Air transport (1950): passenger-mi. 532.6 million; cargo ton-mi. 9,753,000. Telephones (1949): 2,230,597. Wireless licences (Sept. 1950): 2,177,000.

Finance and Banking. Budget (million Canadian dollars): (1950-51 est.) revenue 3,105, expenditure 2,902; (1951-52 est.) revenue 3,730, expenditure 3,700. Gross national debt (March 1949; March 1950 in brackets) 16,950 (16,751). Currency circulation (Aug. 1950; Aug. 1951 in brackets): 1,159 (1,262). Bank deposits (Aug. 1950; Aug. 1951 in brackets): 3,380 (3,457). Gold and U.S. dollar holdings (million U.S. \$, Sept. 1950; Sept. 1951 in brackets): 1,790 (1,611). Monetary unit: Canadian dollar, with an exchange rate (Nov. 30, 1951) of C\$ 2.90 to the pound and C\$ 1.04 to the U.S. dollar. Between Sept. 19, 1949, and Sept. 30, 1950, at which date the Canadian dollar was freed, the official rate of exchange was C\$ 3.08 to the pound and C\$ 1.105 to the U.S. dollar.

CANADIAN LITERATURE. The English-Canadian novel was meagrely represented in 1951. Hugh MacLennan's *Each Man's Son*, dealt with events in a Nova Scotia mining community and Morley Callaghan's *The Loved and the Lost*, about racial problems in Montreal, stated problems without suggesting answers. Better results came from two new novelists: the dramatist Robertson Davies' *Tempest-Tost* satirized Canadian small-town life with an alertly roving eye and the poet A. M. Klein's *The Second Scroll* described and analysed various spiritual values. Some attempts to deal with Canadian problems were to be found in W. G. Hardy's *The Unfulfilled*, George Glay's *Beggars Might Ride*, John Cornish's *The Provincials*, Hugh Garner's *Cabbage Town*, Lois Edwards' *My Heart in Hiding* and Louise Riley's *One Happy Moment*, but the attempts were disappointing. Both Gabrielle Roy's *Where Nests the Water Hen* and Kristine Kristofferson's *Tanya* had scenes laid in Manitoba, but whereas the latter was full of action, the former was almost without a plot. When it came to plain storytelling, veteran Will R. Bird's *So Much to Record*, dealing as usual with Nova Scotia, and Luella Creighton's *High Bright Buggy Wheels*, about an Ontario Mennonite settlement, were outstanding.

Other representatives of imaginative literature were also scarce. *The Mulgrave Road* by Charles Bruce, however, exhibited sharp insight into Nova Scotia's special qualities and *The Victorian House and other Poems* by Philip Child was an arresting study of human psychology.

The output of non-fiction in 1951 might be divided into examples of personal and handbook literature. Among the

former, a few were simple autobiography, such as Billy Button's *I Married an Artist*, Kenneth M. Wells' *Up Medonte Way*, Barbara Ann Scott's *Skate with Me* and Oliver Philpot's *Stolen Journey*; and some were straightforward travel, such as Lyn Harrington's *Manitoba Roundabout*, Lilian Maxwell's *'Round New Brunswick Roads*, John and Marjorie Mackenzie's *Quebec in Your Car*, Blodwen Davies' *Quebec: Portrait of a Province*, Evelyn Earle's *Leeds the Lovely* and Jessie Lawson and Jean Sweet's *This Is New Brunswick*. The autobiographies were light in vein, and the travel was Canadian. There were, however, two outstanding works: Barbara Cormack's *Local Rag* was an autobiographical novel with its material projected through the files of a small prairie town weekly newspaper; and Judith Robinson's *As We Came By* was an acutely critical account of European travel. Works of humour included Harry Symon's *The Bored Meeting*, Jan Hilliard's *The Salt-Box* and John Robins' *Cottage Cheese*.

For the most part, the rest of the non-fiction published by Canadian writers consisted of handbooks. Some were of a high standard, including L. L. Snyder's *Ontario Birds*, Daniel McGowan's *Tidewater to Timberline*, Roderick Haig-Brown's *Measure of the Year*, John Murray Gibbon's *Romance of the Canadian Canoe*, Josephine Phelan's *Ardent Exile* and E. K. Brown's *Rythm in the Novel*.

There was a pronounced drop in the production of non-fiction for boys and girls, which was not counterbalanced by more juvenile novels. However, a few of the latter were appealing. Olive Knox's *Little Giant* (Henry Kelsey) was the only historical story. Career themes were more popular and included Jack Hambleton's *Tom Walden, Cub Reporter*, Lyn Cook's *The Little Magic Fiddler* and Foster Hewitt's *Along Olympic Road*. But few Canadian writers in the juvenile field could surpass veteran Dickson Reynolds for thrill and dash and implicit moralizing, of which her *Angry River*, describing the Fraser river in flood, was a good example. (See also LITERARY PRIZES.) (C. Cy.)

CANALS AND INLAND WATERWAYS. The third report of the British Transport commission was published in July 1951. It recorded that during 1950 the Docks and Inland Waterways executive had taken over—from the Railway executive—the Fosdyke navigation and the Witham navigation (Lincolnshire), the Stourbridge Extension canal (Worcestershire), and the Forth and Clyde and Union canals in Scotland. It was agreed to sell the reservoir and lido at Ruislip, Middlesex, to the local authority. The waterways administration associated themselves with the Railway executive and the Road Haulage executive in the establishment of joint organizations at a number of towns for dealing with enquiries about rates, services and other matters. Liaison was maintained with the National Coal board and the British Electricity authority. Work was advanced on a new lock at Newark, Nottinghamshire, to accommodate four standard Trent craft; the old lock could take only one such boat. Dredging was carried out on the Trent navigation to provide an improved channel to a general minimum depth of 5 ft. Work proceeded on a quay wall at Diglis basin, Worcester, to accommodate an increasing number of petroleum-carrying craft. It was also decided to improve the Severn channels to enable craft carrying 400 tons to navigate to Worcester, and to carry out works above Worcester to enable existing craft to load up to 150 tons. Generally, much dredging was done: in the midland district of the south-western division alone, 600,000 tons of silt was removed during 1950, against the former dredging output of 40,000 tons a year. Banks were protected by steel piling. Pontcysyllte aqueduct (River Dee, Denbighshire) was emptied and repaired. Flood prevention work was done on the Witham navigation at Lincoln. Total waterway traffic in 1950 was 11,802,000

The locks at Tiel, Netherlands, under construction on the Amsterdam-Rhine canal. The locks were the largest in Europe.

tons, an increase of 4.2% over 1949. The executive carried 9% of the total in their own craft. There was a deficit of £93,795 on the carrying business but an amount of £144,141 accrued to the executive as toll payments in respect of that business. As from May 1950, the executive increased statutory charges by 16 $\frac{2}{3}$ % and also raised non-statutory charges where appropriate.

France. The new Jeu de Mail lock, with a reclaimed drop of 1.43 m., on the canal from Bourbourg to Dunkirk, was brought into use in place of the old lock destroyed in World War II. On a branch of the Neuffosse canal around St.-Omer, work on the Flandres lock, with a reclaimed drop of 3.97 m., was further advanced; it would replace the Haut-Pont and St.-Bertin locks and would accommodate barges, vessels up to 600 tons and lighters. A scheme was produced for a new deep-drop Fontinettes lock at Arques (Seine-Inférieure) to augment the existing lift, which could only take craft carrying 280 tons: the proposed new drop was 13.13 m. Progress was made with the new lock on a branch of the River Deule, at Dow; there would be two basins in tandem with a reclaimed drop of 2.82 m. Further consideration was given to the project for the Grand-Carré lock at Lille; this was to be constructed on a branch of the Deule canal and would allow the reclamation of existing locks at La Barre, Ste.-Hélène Wambrechies and Quesnoy-on-Deule. At the old Lens lock on the Lens canal reconstruction continued; this was designed to repair the effect of mining subsidence and, with a reclaimed drop of 7.7 m., to allow vessels of 600 tons to be docked.

Germany. Removal of wreckage from navigable rivers continued; shipping traffic operated normally. Progress was made in waterway extensions on the River Main near Würzburg and at Neckar near Heilbronn (Württemberg). A double lock to lower and raise ships on the River Mosel was completed. Extension work continued on the Dortmund-Ems canal. On the Kiel canal, slopes, locks and retaining sluices were renewed.

Netherlands. A new Amsterdam-Rhine canal was opened with the object of shortening the route between the lower Rhine towns and the port of Amsterdam. (A. H. J. B.)

Canada. During 1951 the federal government passed an act to establish the St. Lawrence Seaway authority and plans were made for the deepening of the Cornwall-Prescott section of the St. Lawrence-Great Lakes seaway from 14 ft. to 27 ft. Parliament voted \$4,523,107 for the maintenance and operation of the canal services in 1951-52 and \$2,013,409 for the continued dredging of the St. Lawrence river ship channel below Montreal. Record tonnages were worked through the three major lock groups of the St. Lawrence-Great Lakes system in the April-Oct. 1951 navigation season. The figures were: Sault Ste. Marie (Canadian-U.S.) 107,729,730 (1950 season, 93,280,527); Sault Ste. Marie (Canadian only) 2,285,699 (1,886,881); Welland 13,774,107 (12,400,905); St. Lawrence 8,692,183 (8,648,438). (C. Cy.)

United States. The Rivers and Harbours act of 1951 provided for \$125,192,613 for the construction of 43 authorized projects in 29 states. An additional \$61,287,000 was appropriated for the maintenance and operation of ports and inland waterways. The lower Mississippi river received a separate appropriation of \$60.5 million.

The total net water-borne commerce of the United States was 820,582,362 short tons (prelim. est.) in the calendar year 1950. U.S. commerce on the Great Lakes totalled 169,879,433 tons, aggregating 111,687,340,000 ton-mi. Inland waterway commerce, excluding that on the Great Lakes, totalled 51,256,637,000 ton-mi. of this total, the Mississippi river system accounted for 33,597,816,000 ton-mi. (See also DOCKS AND HARBOURS; FLOODS AND FLOOD CONTROL; PANAMA CANAL; SUEZ CANAL.) (G. Hb.)

Rolt, *The Inland Waterways of England* (London, 1951).

CANCER. The expansion in cancer research since the end of World War II continued during 1951. Increased attention was given to the biochemical mechanisms by which the chemical carcinogens—for example, substances such as

polynuclear hydrocarbons, azo dyestuffs and aromatic amines which are capable of causing cancer—effect the transformation of normal cells into cancer cells. Intensive study of the cancer-producing action of the “nitrogen mustards”—that is, the nitrogen analogues of mustard gas or “sulphur mustard”—supported the view that the carcinogenic activity of these substances was associated with chemical “alkylation” of hereditary determinants in the normal cell, leading to genetic modification. Other contributions to this rapidly developing subject included investigations of the action of these compounds upon nucleic acid, a suggestion that they might act by interference with gene-synthesis, and studies of the related activity of the same substances in producing gene mutation. Examination of other types of biological alkylating agent also disclosed carcinogenic potency in a number of “ethyleneimines” and “di-epoxides,” some of which were suggested by their use in the cross-linking of textile fibres. An interesting conception emerged during the year, that carcinogens of this general class might operate by expediting chemical changes in protein which might equally occur “spontaneously” in the process of ageing.

Among specialized forms of the disease, the incidence and causation of cancer of the bladder in industry continued to be investigated. G. M. Bonser and D. B. Clayson related the carcinogenicity of the dyestuff intermediate β -naphthylamine with the excretion in the urine of a specific metabolite, and also found this substance to be carcinogenic on direct contact with the bladder mucous membrane. The greatly increased recorded incidence of cancer of the lung still presented a problem of the first magnitude. Sir Ernest Kennaway drew attention to the high proportion of lung cancer now found among autopsies on cases of cancer in hospitals in large towns. The association between the incidence of bronchial carcinoma and smoking was investigated by A. Bradford Hill and R. Doll, and led E. Kennaway and M. E. Daff to study the arsenic content of tobacco, as a possible etiological agent. This did not however provide any simple explanation, although it was considered that it might be involved jointly with other agents; e.g., with atmospheric contaminants such as coal smoke, or the products of the internal combustion engine. Experiments were also started to assess the influence of radioactive material in the atmosphere. An important finding in relation to another type of cancer was reported by J. W. Cook and R. Schoental, namely, that prolonged administration to rats of alkaloids of the ragwort (*Senecio Jacobaea*) led to the appearance of liver tumours: this observation was of interest in its bearing on the high incidence of primary cancer of the liver among the Bantu in South Africa, and the suggestion that the indiscriminate medicinal use of *Senecio* plants by the South African Negroes might be a causal factor.

That certain animal tumours might be caused by viruses had long been known, as in the cases of the “milk factor” of Bittner, which can determine mammary cancer in mice, and the viruses recoverable from various chicken tumours. R. D. Passey, L. Dmochowski and W. T. Astbury succeeded in establishing a correlation between the biological activity of various tissues, and the content of these preparations in particles revealed by electron microscopy and believed to be the mammary cancer virus itself. The same workers completed an investigation of the resistance of cancer cells to freeze-drying. While earlier experiments along the same lines had been interpreted by W. E. Gye as indicating a causal virus, the latest experiments showed conclusively that Gye's interpretation was invalid.

Although the chemotherapy of cancer was still in a rudimentary stage, advances were recorded, as, for instance, in the use of triethylene-melamine (“TEM”), a compound originally devised by the Hoechst Farbwerke as a cross-linking

agent for textiles, and certain dimethylalkanes in the treatment of chronic myeloid leukaemia. Even so, it seemed increasingly probable that the use of such substances was but a phase, and that they would be rendered obsolete by developments from more fundamental investigations of the mechanisms of carcinogenesis; more real insight into this process was obtained than in almost any previous year, with great promise for the future. (See also SURGERY.) (A. Hw.)

CANNING INDUSTRY. The event of the year was the World Congress on Canning (Paris, Oct. 16-19) organized by the Comité International Permanent de la Conserve. Developments mentioned by British delegates included a rapid “flame peeling” process for fruits, tests on aluminium cans for fruits and vegetables and the use of electrolytic tins for canning vegetables. G. G. Knock (South Africa) said that 12 years earlier the total output of South Africa's canneries was 55 million lb., whereas it was now about five times that figure. W. Krehl, Yale Nutrition laboratory, U.S., said that more was known about the nutritional value of canned foods than about any other type of processed food. F. Jakobsen (Sweden) mentioned new types of modified phenolic lacquers used for deep drawn cans in the U.S. and in Scandinavia. Research in the United States was directed towards improving the canning process and towards methods of saving tin, for example, by wider use of thinly coated electrolytic tins. Dr. B. E. Proctor described to the National Canners Association of America the possibility of sterilizing canned foods by cathode rays, without any appreciable heating effect.

Statistics published during the year by the Ministry of Food showed that the United Kingdom production of canned vegetables increased from 300,800 long tons in 1949 to 322,000 tons in 1950, including 143,600 tons of processed dried peas and 93,400 tons of baked beans. Canned fruit fell from 89,100 tons to 75,100, including 35,200 tons of plums and 16,000 tons of apples. Canned soups fell from 71,200 tons to 60,300 and homogenized baby foods from 7,200 tons to 5,100.

The International Tin Study group reported that out of a world consumption of nearly 5,750,000 tons of tins in 1950, the American continent used 4,152,000 tons, Europe 1,026,000 tons, Asia 250,000 tons, Australasia 124,000 tons and Africa 96,000 tons. Despite a world production approaching 6 million tons in 1951 there was a shortage of tins in most countries.

The United Nations Food and Agriculture organization engaged technical experts to advise far eastern and Latin American countries on the development of their fisheries. The Colonial Development corporation erected a cannery for turtle soup on Grand Cayman island, British West Indies, to process 3,000 turtles a year. In Portugal, after several years with poor yields of fish, the sardine canning industry improved, having begun to revive in the middle of 1950. In Malaya, the pineapple canning industry produced

about a million cases against only 9,000 in 1946. There were also considerable developments in pineapple canning in Australia and South Africa. The demand for canned pineapples was such that new plantations in the eastern part of Cape Province changed the aspect of the countryside. South Africa's crop was valued at £1 million. (G. H. M. F.)

United States. Production in the United States of canned fruits, fruit juices, fruit and vegetable specialties, vegetables, milk, fish and meat in 1951 totalled about 640 million standard cases (preliminary estimate) as compared with 566·3 million standard cases in 1950. The 1951 total pack was estimated to be 13% more than that of 1950, canned fish being the only pack to show a decrease. In price canned food showed an increase of about 66% above pre-World War II levels as compared to an increase of 125% for all foods. Over the same period consumption of canned food increased by 55%.

Technological developments in the canning industry included extended use of "high temperature-short time" processing which utilizes the principles of agitation and aseptic filling, particularly in canning milk. (E. J. C.)

CANOEING. British championships in kayak slalom were held in 1951 on the River Usk at Whitsuntide, and a large entry found first rate water conditions. Scotland was again successful, for Mr. and Mrs. James McLean of the Tay Canoe club were the victors in the men's and the women's events respectively. The Scottish slalom was held on the Tay during May, and again J. McLean was the winner. In July, the world championships, held on the River Enns (Austria), were won by Fruhwirth (Austria).

The British paddling championships were held on the Thames near Marlow and there was a record entry in all classes. One member of the Royal Canoe club, G. C. Colyer, was awarded the Dexter trophy for the most meritorious performance by a newcomer to the championships. The results were: (i) kayak singles 10,000 m., G. C. Colyer (Royal Canoe club), 52 min. 41·8 sec.; 1,000 m., R. G. Prout (Canvey Island Canoe club), 4 min. 58·2 sec.; 500 m., W. Young (Canoe Camping club), 2 min. 49·4 sec. (ii) Kayak pairs. 10,000 m., R. G. and F. S. T. Prout (C.I.C.C.), 49 min. 45·6 sec.; 1,000 m., R. G. and F. S. T. Prout (C.I.C.C.), 4 min. 39·4 sec.; 500 m., R. G. and F. S. T. Prout (C.I.C.C.), 2 min. 19·4 sec. (iii) Kayak fours. 1,000 m., Canvey Island Canoe club, no time recorded. (iv) Canadian singles. 1,000 m., G. D. Marchand (R.C.C.), 6 min. 29 sec. (v) Kayak singles. 4 × 500 m. relay race, Richmond Canoe club, 9 min. 34·4 sec. (vi) Women's kayak singles. 500 m., J. Webb (Richmond Canoe club), 2 min. 55·8 sec. (vii) Women's kayak pairs. 500 m., J. Webb and A. Jenkin (Richmond Canoe club), 2 min. 46·4 sec.

The "Turn of the Tide" race for touring canoes (Richmond bridge to Greenwich and then back to the South Bank Festival site) was won by G. C. Colyer and G. Palmer of the Royal Canoe club. (J. W. D.)

CANTERBURY, ARCHBISHOP OF. GEOFFREY FRANCIS FISHER, 100th archbishop of Canterbury, primate of all England (b. Higham-on-the-Hill, Leicestershire, May 5, 1887), was ordained priest in 1913. He was enthroned as archbishop of Canterbury, in succession to William Temple (1881-1944), on April 19, 1945. (For an account of his earlier career see *Britannica Book of the Year 1951*.)

After his return from Australia and New Zealand on Jan. 22, 1951, the archbishop was given an enthusiastic public welcome at the Central hall, Westminster, London (Jan. 30). He received Queen Mary at the spring meeting of the Church assembly, when two memorial plaques were unveiled by her. In April he visited Sierra Leone to inaugurate

the new province of West Africa and toured the interior of the country with the governor. He preached at St. Paul's cathedral, London, when the Festival of Britain was opened (May 3) and addressed a great meeting in Hyde park in connection with the Festival (July). He also closed the Festival at the Royal Festival hall, South Bank (Sept. 30). He addressed the Convocation of Canterbury on "Relations with other Christian Churches at Home and Abroad." He attended the 250th anniversary of the Society for the Propagation of the Gospel at St. Paul's (June 17), when the queen and Princess Margaret (*q.v.*) were present, and subsequently blessed the S.P.G. missionary ship "Centurion" at Lambeth bridge. On July 4 he preached at St. Paul's before the queen and the two princesses at the presentation of the American roll of honour by General Dwight Eisenhower (*q.v.*). He conducted prayers for the king's health at Lambeth palace in the presence of the queen and the royal family. He addressed the governing body of the Church in Wales and, in October, an election service at St. Paul's. (A. J. MACD.)

CAPE VERDE ISLANDS: see PORTUGUESE OVERSEAS TERRITORIES.

CARIBBEAN COMMISSION. An advisory body set up in 1946 by France, the Netherlands, Great Britain and the United States in succession to the Anglo-American Caribbean commission to encourage co-operation among the territories in this area and facilitate research. Two subsidiary bodies are the Caribbean Research council and the West Indian conference. The conference assembles every second year and provides a forum at which representatives of the peoples themselves can discuss social and economic matters. The commission maintains a secretariat at Port of Spain, Trinidad, and meets twice a year.

The commission's 12th meeting was held in Barbados in May 1951, and the 13th at St. Croix, Virgin Islands, in October. The commission continued publication, in English and French, of its *Monthly Information Bulletin* and of *Caribbean Economic Review*. New publications included the first issues of *Current Caribbean Bibliography* and *Caribbean Statistical Digest* and a study of current housing problems in the Caribbean.

In addition to various meetings of committees of the Research council, the commission arranged several technical conferences. These included one on rural co-operatives, Caribbean, sponsored jointly with the Food and Agriculture organization of the United Nations, and the first meeting of the Eastern Hurricane sub-commission of Regional Association IV of the World Meteorological organization. While continuing to co-operate on requests for technical assistance from national and international agencies, the commission itself found occasion to extend help directly to several territories. (P. H.-M.)

CAROLINE ISLANDS: see PACIFIC ISLANDS, U.S.; TRUST TERRITORIES.

CARTOGRAPHY. In the preparation of projections for small-scale maps, such as those used in atlases, the earth is generally assumed to be a sphere; but in order to obtain the best results with larger-scale maps it is necessary to take into account, as accurately as possible, the figure of the earth. To determine this, measurements of the highest possible order of accuracy are made of certain selected arcs of meridians of longitude and parallels of latitude. Soon after his appointment as H.M. astronomer at the Cape observatory in 1879, Sir David Gill began to advocate such a measurement of the 30th meridian from the coast of South Africa to the Mediterranean near Cairo. By 1951 the

triangulation for this arc had been done except for a very difficult stretch approximately from lat. 1°N. to lat. 10°N. in Uganda and the Anglo-Egyptian Sudan. The calculations for the section south of the equator were completed, and it was then available for use by the survey authorities of the various adjacent territories. It was likely to be at least ten years before the entire arc could be completed. It was not expected that it would be possible to carry triangulation across the southern Sudan, and the final link would have to be made by traversing.

Permanent headquarters for the Old World division of the World Land Use survey were established in London and offers of collaboration came from many parts of the world. Pilot surveys began in the Gold Coast, Nigeria, Ceylon, Singapore, Canada and Switzerland. It was found that a great deal of the work could be done from air photographs and a detailed map of a small part of Nyasaland was prepared by this means and sent for checking on the ground. Much information could also be obtained from standard topographical maps; and revenue surveys and other local government records were found to be of great value, particularly in certain countries of south and southeast Asia.

The Shoran triangulation net in Saskatchewan and Manitoba was successfully concluded. Final calculations showed that the fixing of a point did not err by more than 25 ft. over a distance of 1,100 mi., giving an accuracy to about 1 part in 60,000 for this radar method. Experiments were also conducted to discover its suitability for use in Australia.

The British Directorate of Colonial Surveys continued to expand and added contours to many of its preliminary plots, which had previously shown only plan detail, such as settlement, communications, vegetation, cultivation, etc. The help of private air survey firms was called in, so that the entire burden of photography no longer devolved on the R.A.F.

Reduction and generalization of the new 1:25,000 map of Belgium, publication of which began in 1950, was started, to provide a map on a scale of 1:50,000. The smaller scale was intended mainly for military use.

The first part of an atlas of the province of Lower Austria was published. It showed agricultural distributions in considerable detail, and also some industrial distributions and the morphology and natural regions of the province. It was intended that later parts should contain maps of climate, geology, population and other phenomena.

Plates 2 and 3 of the *Atlas of Distribution of Diseases* (American Geographical Society, New York) were published, and showed the distribution in space and time of cholera and malaria.

In Britain a new atlas, *The Oxford Atlas* (Oxford University Press, 1951), was published and became the centre of a great deal of controversy. It was, eventually, fairly generally agreed that the design as a whole was good, but that a number of rather conspicuous minor errors would require correction in a later edition. The Ordnance survey 1:25,000 map was completed for England except for part of Northumberland and a few sheets in the Lake district. In Scotland and Wales, the lowlands and more thickly populated parts were covered. A map of *Ancient Britain* (Ordnance survey, 1951) showed the sites of major visible antiquities older than A.D. 1066.

CASEY, RICHARD GARDINER, Australian statesman (b. Brisbane, Aug. 29, 1890), was educated at Melbourne Church of England grammar school, at Melbourne

university and at Trinity college, Cambridge. He served in Gallipoli and in France in World War I, receiving the D.S.O. and the M.C. From 1924-31 he was liaison officer between the Australian government and the Foreign Office. He was elected to the House of Representatives for Corio, Victoria, in 1931. He was assistant federal treasurer from 1933 until 1935 when he became treasurer. He remained in this post until 1939. He was minister for supply and development until Jan. 1940 when he became the first Australian minister to the United States. He was appointed by Winston Churchill as minister of state in the middle east with a seat in the war cabinet in 1942. He was made a companion of honour in 1944 and in the same year became governor of Bengal, the first governor in the British empire to be chosen from outside Great Britain. He retired from this office in 1946 and returned to Australia. He was elected to the House of Representatives in 1949 for La Trobe division, Victoria, and in Dec. 1949 became minister of supply and development until 1950 when he became minister of national development in R. G. Menzies' coalition government. On April 26, 1951, he succeeded P. C. Spender as minister for external affairs. On July 20 he left Australia for a tour of Asia, visiting Jakarta, Singapore, Saigon, Bangkok, Hong Kong, Manila, and also Japan and Korea, returning to Australia, Aug. 22. He left for Europe on Oct. 21 and visited Singapore, Rangoon, New Delhi, Karachi, Cairo and Rome before arriving in Paris for the United Nations general assembly. He arrived in London, Nov. 21, for discussions with British ministers. He addressed members of both houses of parliament at Westminster on Nov. 28 and later visited the United States and Canada. He returned to Australia on Dec. 19.

CENTENARIES. The main centennial celebrations in Great Britain in 1951 commemorated the Great Exhibition of 1851. (See FESTIVAL OF BRITAIN 1951.)

Ceremonies were held in Worcester and in London to mark the 300th anniversary of the Battle of Worcester, when Oliver Cromwell defeated the last Royalist attack. On Sept. 3, 1951, Isaac Foot, president of the Cromwell association, unveiled a plaque at Worcester, and a service was held by Cromwell's statue at Westminster. Four days later, at Boscobel, near Wolverhampton, over 1,200 people gathered to celebrate the escape after the Battle of Worcester of Charles II who had hidden in an oak tree. The duchy of Lancaster was created a county palatine on March 6, 1351, when Edward III made Henry of Lancaster the first Duke of Lancaster. Higham Ferrers, Northamptonshire, celebrated in December the 700th anniversary of its grant of a borough charter.

Many London centenaries were noted during 1951. The Society of Antiquaries of London celebrated the 200th anniversary of the grant of its charter by George II. It was on May 24, 1851, that the Public Record office was opened on a small site in Chancery lane, London. Hay's wharf recorded in 1951 the 300th anniversary of its founding by Alexander Hay. The year 1951 was also the centenary of the first shoeblacks in London.

The Honourable Society of Cymmadorion was founded in Sept. 1751 for the promotion of the study, history, practice and development of literature, the arts and science in so far as they were of special interest to the Welsh people. In Dec. 1951 the society was granted a royal charter, which was presented by Princess Elizabeth.

An exhibition of paintings by J. M. W. Turner was opened at the Tate gallery, London, to record the centenary of his death. In 1651 *Leviathan*, by Thomas Hobbes, and, 100 years later, *Elegy in a Country Churchyard*, by Thomas Gray, were published.

In the field of education two British universities celebrated anniversaries of their foundation. In January the University of Glasgow celebrated its creation on Jan. 7, 1451, by a bull of Pope Nicholas V. The university was the fourth in seniority of British universities; Oxford, Cambridge and St. Andrews being founded before 1451. An impressive part of the celebrations was the carrying of lighted torches by a team of runners, from Bedrule, the birth-place of Bishop William Turnbull, the founder of the university, to Glasgow. In May, Manchester university celebrated the centenary of the founding of Owens college in 1851.

In the United States, celebrations were held to mark the bicentenary of Benjamin Franklin's founding of the University of Pennsylvania library. The University of San Marcos in Lima, Peru, and the University of Mexico both celebrated their fourth centenaries. Emperor Charles V signed the charter of the University of San Marcos on May 12, 1551, and that of the university of Mexico on Sept. 21, 1551, thus creating in the same year the first universities of South and central America.

The Duke of Gloucester attended the celebrations to mark the centenary of the founding of St. John's school, Leatherhead, which provided for the education of sons of the poorer clergy. Louth grammar school was founded in 1551; Scotch college, Victoria, Australia, was founded in 1851.

At Holy Island, or Lindisfarne, a special pilgrimage was made to commemorate the 1,300th anniversary of the death of St. Aidan, who founded his monastery there in 635.

In the press world the outstanding centenary of 1951 was that of Reuters, the British and Commonwealth news agency founded in London by Paul Julius Reuter. The *New York Times* was 100 years old on Sept. 18. Other newspaper centenaries included the *Wells Journal* and the *Cornish Telegraph*.

Paris (*q.v.*) celebrated its bimillenary in 1951. The actual year of the founding of Lutetia, from which Paris grew, could not be fixed with any certainty. Kristiansand, Norway, recorded its tercentenary and Zürich, Switzerland, celebrated the 600th anniversary of the city's joining of the Swiss confederation. In Greece, celebrations were held to mark the 1,900th anniversary of the arrival of St. Paul in Greece.

Other anniversaries recorded in 1951 included: the founding of the Bergen shipping line, 1851; the first standard-gauge railway in South America, 1851; the birth of Isabella of Castille, April 22, 1451; the beginning of the Canadian postal administration, 1851; the first British-American yacht races at Cowes, 1851; the founding of the Young Men's Christian association in the United States, 1851; the founding of the Geological Survey of India, 1851; the founding of the Marienkirche at Lübeck, 1251; and the birth of the Persian philosopher Avicenna in the Mohammedan year 370 (according to the Mohammedan hegira, part of A.D. 1951 coincided with the year 1370).

See H. B. Charlton, *Portrait of a University, 1851-1951* (Manchester, 1951); Sir Roderick Jones, *A Life in Reuters* (London, 1951).

CEREALS: see GRAIN CROPS; WHEAT.

CEYLON. Self-governing member of the Commonwealth of Nations, lying S.E. off the southern extremity of India. Area: 25,322 sq.mi. Pop.: (1946 census) 6,693,945; (mid-1950 est.) 7,500,000. Language: mainly Sinhalese (69%) and Tamil (21%). Religion: Buddhist (61%), Hindu (22%), Moslem (9%) and Christian, mainly Roman Catholic, (7%).

Chief towns (pop., 1946 census): Colombo (cap., 362,000); Jaffna (63,000); Dehiwala-Mt. Lavinia (56,000); Kandy (52,000). Governor general, Lord Soulbury; prime minister, Don Stephen Senanayake.

History. The Port of Colombo Administration act, which came into force on Jan. 1, 1951, gave the Colombo Port commission a Ceylonese majority among the non-official members for the first time. The increase in the number of Ceylonese employed in commerce and industry engaged the government's attention. A. E. Goonesinha, minister in charge of what was termed "Ceylonization," told the House of Representatives that more Ceylonese should be employed in the higher posts on estates and in commercial firms and banking institutions. The planting industry was sympathetic but contended that many years of practical experience were required before proficiency in all branches of planting was reached. The criterion should be efficiency, not nationality. The percentage of Ceylonese superintendents to Europeans in the planting industry within the last 12 years had increased from 10% to 19%, and Ceylonese assistant superintendents to Europeans from 10% to 40%.

The budget presented on July 13 showed an estimated revenue for 1951-52 of Rs. 971 million and expenditure Rs. 1,244 million. Of this expenditure Rs. 910 million was to be provided from the consolidated fund and the balance, Rs. 330 million, from the loan fund. The budget was the largest in the history of Ceylon. The main items of revenue were estimated to be: customs Rs. 553 million; income tax, estate duty and excess profits tax Rs. 202 million; railways Rs. 65 million; excise and salt Rs. 46 million. The chief items of expenditure were estimated to be: food and co-operative undertakings Rs. 176 million; health and local government Rs. 131 million; education Rs. 140 million; agriculture and lands Rs. 79 million; labour and social services Rs. 24 million. The total expenditure on defence was estimated at Rs. 22 million, as against Rs. 9 million for 1950-51.

The budget provided for an increase in the profits tax from 20% to 25%, and for increases in income tax on incomes of over Rs. 20,000 a year, ranging from 22% to 24% in the Rs. 20,000 income group and from 66% to 76% at the other end of the scale. Increased family allowances were granted to the middle and lower income groups. The tax payable by resident companies was increased from 28% to 38%, and by non-resident companies from 24% to 36%. There was a reduction of import duties on certain consumer goods and on capital goods such as motor vehicles. A sliding scale for export duties on rubber and coconuts took effect from Sept. 10. Reliefs to industry, including exemption from taxation for the first three years on investment in government-sponsored corporations and the taxation only on profits exceeding 5% for the first three years on defined industrial undertakings, started after April 1, 1951. Exchange controls were relaxed from Sept. 19, and travel rations increased.

A trade agreement between Ceylon and Pakistan was signed in Karachi on Sept. 14, coming into force retrospectively from July 1, 1951. From Pakistan Ceylon was to receive food-stuffs, bone meal, manure, ash and sulphuric acid. Ceylon was to supply Pakistan mainly with copra and coconut oil. On June 9 the prime minister informed a deputation of Ceylonese rubber producers that Ceylon would continue to be a free market for all buyers. This emphasized Ceylon's decision not to cut off supplies of rubber to China, a decision which was recognized, despite certain criticisms, as in conformity with Ceylon's economic requirements. Radio Ceylon was supplied with radio equipment in return for facilities to broadcast "Voice of America" programmes as a result of an agreement concluded with the United States government on May 14.

Don Stephen Senanayake attended the Conference of Commonwealth Prime Ministers in London in January. In October he paid a courtesy visit to Australia and New Zealand, stopping for a few days at Rangoon, where he was the guest of the Burmese government, and in Singapore, where he was the guest of the commissioner general for southeast Asia, Malcolm Macdonald. On July 12 S.W.R.D. Bandaranaike, minister of health, resigned owing to a difference of opinion with the cabinet. The prime minister took over the health portfolio pending further arrangements. J. R. Jayewardene, minister of finance, led the Ceylon delegation at the Japanese peace treaty conference at San Francisco, and signed the treaty on behalf of Ceylon.

On his way to London, the Burmese ambassador designate to the United Kingdom, U Ka Si, leading a party of Burmese pilgrims to the Temple of the Sacred Tooth at Kandy, presented to the temple a golden casket valued at Rs. 150,000, and among other gifts by the pilgrims was a large quantity of teak for the construction of new buildings at the temple. (See also COLOMBO PLAN.) (E. Hd.)

Education. Schools (1949): Sinhalese and Tamil government and assisted 5,610, pupils 1,010,184; central and English 631, pupils 237,678. Technical college (1949-50): students 1,969. Teachers' training colleges (1949): 20; students, primary 1,653, secondary 222, post graduate 68. University (1949-50): students 1,850.

Agriculture. Main crops ('000 metric tons): tea (1949; 1950 in brackets) 135.4 (138.9); rice, paddy (1948; 1949 in brackets) 310 (295); cassava (1948) 150; sweet potatoes and yams (1948) 52; millet (1948) 10. Copra exports ('000 metric tons, 1950; 1951 est.): 21 (20). Livestock ('000 head, Dec. 1949): cattle 1,249; sheep 57; pigs 104; buffaloes (Dec. 1948) 658; goats (May 1950) 370. Coconut oil exports ('000 metric tons, 1950; 1951 est. in brackets): 77 (112).

Industry. Fuel and power: manufactured gas ('000 cu. m., 1950; 1951, six months, in brackets) 9,000 (4,590); electricity (million kwh., 1950) 81. Raw materials (metric tons): rubber (1950; 1951, six months, in brackets) 115,302 (49,270); graphite (exports, 1949) 12,434; salt (1949) 28,775.

Foreign Trade. (Million rupees, 1950; 1951, six months, in brackets): imports 1,164 (773); exports 1,560 (1,028). Main sources of imports (1950): U.K. 20%; Burma 20%; India 16%; Australia 7%. Main destinations of domestic exports: U.K. 24%; U.S. 22%; Australia 8%; Canada 6%. Main imports: rice, cotton piece-goods and sugar. Main exports: tea, rubber and coconut oil.

Transport and Communications. Roads (1949): 6,535 mi. Licensed motor vehicles (Dec. 1950): cars 32,500; commercial 14,800. Railways (1949): 896 mi.; passengers (1949) 26.7 million; goods ('000 metric tons, 1949-50) 1,350. Air transport (1950): passenger-mi. 6,152,000; cargo, ton-mi. 73,000. Telephones (1949): 14,884. Wireless licences (1950): 28,000

Finance and Banking. (Million rupees) Budget: (1950-51 est.) revenue 794, expenditure 704; (1951-52 est.) revenue 896, expenditure 886. Gross national debt (Sept. 1949; Sept. 1950 in brackets): 549.1 (561.4). Currency circulation (Aug. 1950; Aug. 1951 in brackets): 274 (362). Bank deposits (July 1950; July 1951 in brackets): 458 (637). Monetary unit: *rupee*, with an exchange rate of Rs. 13.33 to the pound and Rs. 4.775 to the U.S. dollar.

CHAD: see FRENCH EQUATORIAL AFRICA.

CHAMBERS OF COMMERCE. The amount of draft legislation affecting industry and commerce laid before parliament in 1951 was less than during the immediately preceding years, and not so controversial, but the study of parliamentary bills remained a strong feature of chambers' work. As usual, a letter was sent to the chancellor of the exchequer early in the year, through the Association of British Chambers of Commerce, making recommendations which it was hoped he would take into account in framing his budget. Later, the Finance bill, which contained a number of contentious provisions, was the subject of representations. A draft bill drawn up to codify over 200 acts dealing with customs and excise matters received consideration. In this connection a committee was set up, under the chairmanship of Lord Kennet, to receive comments from representative organizations; the A.B.C.C. was represented on this committee.

Much consideration was given, both by the A.B.C.C. and

its constituent chambers, to rating matters. The association studied the penal effects of the provisions of the 1940 Finance act relating to estate duty and private companies, and considerable thought was given to the problem of bringing the taxing code into line with current needs. The first Millard Tucker committee considered the problem of the taxation of trading profits and a second Millard Tucker committee reviewed the law governing the treatment, for taxation purposes, of superannuation funds and other pension arrangements. A Royal Commission on Taxation was charged to review the whole field of income tax and profits tax. The A.B.C.C. submitted reports to the second Millard Tucker committee and to the royal commission. It considered a draft income tax consolidation bill. Representations were made to the chancellor on the form of government accounts. Representations were also made on behalf of industry and commerce regarding postal services, with special reference to charges and service standards.

Transport matters received extensive attention. These included the question of the integration of publicly owned transport services, the formulation of winter transport policy having regard to current railway difficulties of staff shortages and inadequate capital development and the formulation of new charges schemes for both passenger and freight services. Representatives were nominated to serve on transport users' consultative committees set up under the Transport act of 1947. Matters relating to fuel and power were the subject of study and representations. The A.B.C.C. appointed a committee of experts to consider the urgent question of electricity supplies and its published memorandum *Shedding the Load* was acknowledged both by the government and the public as a constructive approach to a vital problem. The A.B.C.C. also engaged in negotiations on a national price structure for coal.

Discussions continued with the Board of Trade in advance of bilateral trade negotiations with foreign countries and the A.B.C.C. continued to play its part as a member of the Consultative Committee for Industry, a body meeting under the chairmanship of the secretary for overseas trade. The president of the A.B.C.C., A. H. S. Hinchliffe, and the secretary general undertook a goodwill visit to Canada and the United States at the invitation of the national chambers of commerce in those countries, and the chairman of the overseas committee of the A.B.C.C. attended, as an adviser to H.M. government representatives, a trade promotion conference held in Singapore under the auspices of the United Nations Economic Commission for Asia and the Far East. The association was represented by its president and a vice president at a meeting of the Anglo-Canadian Trade committee held in Toronto.

The three-year period allowed to local planning authorities to present their development plans expired on July 1 and most authorities found it necessary to apply to the minister for extensions. Local chambers were consulted on matters affecting the local interests of industry and commerce, generally with a happy result. Membership of the chambers of commerce affiliated to the A.B.C.C. totalled 62,432 on Jan. 1, 1951; this was a record. (A. R. K.)

International. In 1951 the International Chamber of Commerce held its 13th biennial congress at Lisbon attended by representatives of 27 countries and 36 international organizations. The central theme of the congress was a detailed survey of the rearmament problem in relation to economic development. The chamber urged the use of the rearmament programme as a means for strengthening economic co-operation, and stress was also laid on measures to forestall the distortions that production and trade for rearmament purposes would make in the normal trends of economic development.

The chamber continued to play an active part in the deliberations of the Economic and Social Council of the United Nations and at the meetings of other international bodies such as the Inland Transport committee of the Economic Commission for Europe and the revision conferences of the Berne conventions relating to the carriage of goods and passengers by rail. It advocated practical measures for the liberalization of international trade and its recommendations were given close attention by the technical commissions of the United Nations Economic and Social Council and the contracting parties to the General Agreement on Tariffs and Trade.

Measures recommended by the chamber included (i) the acceptance of the exporter's invoice as the basis for customs valuation under the Brussels convention; (ii) the standardization of banking and commercial practice by the adoption of uniform international codes dealing with such matters as commercial documentary credits and trade terms; (iii) the simplification of formalities and the reduction of national barriers in sea and air transport; and (iv) the encouragement of foreign investment through governmental guarantees by capital exporting countries.

(C. G. FE.)

The following I.C.C. reports were published during the year: *Governmental Guarantees to Investors; Unilateral Relief from Double Taxation; International Postage Service; Profits Taxes and Depreciation of Money; International Transport of Perishable Foodstuffs; International Railway Transport; Uniform Customs and Practice for Commercial Documentary Credits; International Trade and Governmental Regulations; Distribution Censuses; Economic Co-operation in a Rearming World; Coordination of Transport; Better Protection of Industrial Property Rights; Standard Forms for the opening of Documentary Credits; International Commercial Arbitration and Freedom of Contract; Resolutions of the Lisbon Congress.*

CHANNEL ISLANDS. Britain's sole remaining possessions of the Duchy of Normandy, consisting of: Jersey, pop. 57,296 (1951 census); Guernsey, Alderney, Sark and Herm, pop. 45,474 (1951 census). Total area: 75 sq.mi. Part of the United Kingdom, but administered independently. Capitals: Jersey, St. Helier; Guernsey, St. Peter Port. Lieut. governor of Jersey, Lieut. General Sir Arthur Grasset; Lieut. governor of Guernsey and the lesser islands, Lieut. General Sir Philip Neame, V.C.

History. In spite of bad growing conditions at planting time Jersey's 1951 potato crop yielded 40,000 tons valued at £1½ million. Tomatoes suffered on both Jersey and Guernsey. The area set outdoors on Jersey was 25% less than in 1950. The yield of Guernsey's glasshouse-grown tomatoes was reduced by about 100,000 baskets of 12 lb. each from the 1950 crop of more than 7 million. The disposal of surplus milk was also a problem on Jersey, where £60,000 was lost in processing butter. Jersey revived its prewar attraction, the battle of flowers. This island also adopted a modified scheme of national insurance against much local opposition.

Guernsey was warned by the president of its Finance committee, the Rev. Sir John Leale, that the greatest measure of economy must be exercised if the island was not to run into grave financial difficulties. Consequently, such schemes as new schools, a bus terminus and an incinerator to serve the entire island were temporarily shelved. A scheme for national insurance similar to Jersey's was, however, adopted in spite of great opposition. Following three years of control of its affairs by Guernsey in a period of financial difficulty, Alderney declared in May that it had now "found its feet."

Guernsey was represented at the Festival of Britain by a team of seven first-grade island cows. Sark was the location of the film *Appointment with Venus*. To help the producers of the film an exception was made to the ancient local law forbidding motor traffic on the roads. Sark's budget showed receipts from local tax on liquor and tobacco of £9,000 and an

estimated expense for the entire needs of the island for the coming year of £5,599.

See Basil C. de Guérin, *The Norman Isles* (revised ed., 1951); G. R. Balleine, *The Bailiwick of Jersey* (London, 1951).

(B. C. DE G.; H. N. M.)

CHEMISTRY. Free Radical Reactions. During 1951 considerable progress was made in the quantitative study of simple free radical reactions. The re-combination of methyl radicals was investigated by R. Gomer and G. B. Kistiakowsky (see *J. Chem. Physics*, 19:85, New York, 1951) by applying the rotating-sector technique to the decomposition of acetone and mercury dimethyl. They obtained a rate constant of $4.5 \times 10^{13} \text{ sec.}^{-1} \text{ cm.}^3 \text{ mole}^{-1}$, and an activation energy of $0 \pm 700 \text{ cal./mole}$. It had been shown previously (see A. F. Trotman-Dickenson and E. W. R. Steacie in *J. Chem. Physics*, 18:1097, New York, 1950) that increase of acetone pressure had little effect on the rate of methyl radical re-combination, so it could now be concluded that these radicals combine at almost every collision without the necessity of a third body to remove energy from the system. K. J. Ivin and E. W. R. Steacie (see *Proc. Roy. Soc.*, A208:25, London, 1951) investigated the disproportionation and combination of ethyl radicals in the photolysis of mercury diethyl. They showed that the re-combination reaction has an activation energy which is probably less than 650 cal./mole, and that the energy of activation for the disproportionation (to give ethane and ethylene) exceeded that for re-combination by $800 \pm 200 \text{ cal./mole}$.

A. F. Trotman-Dickenson, E. W. R. Steacie *et al.* (see *J. Chem. Physics*, 19:169, 172, 329, New York, 1951) investigated the reactions of methyl radicals with paraffins, olefins, cyclic hydrocarbons and a number of other compounds. The activation energies of these reactions were determined on the assumption that methyl radical-methyl radical re-combination requires no activation energy, and were shown to be in the range 7-10 Kcal./mole. It was found that the activation energy for the abstraction of tertiary hydrogen atoms from paraffins was lower than that for secondary hydrogen atoms which, in turn, was lower than that for primary. The steric factor for all these hydrogen abstraction reactions was shown to be of the order 10^{-3} to 10^{-4} . The suggestion of normal steric factors (*i.e.*, greater than 10^{-2}) made by M. G. Evans and M. Szwarc (*Trans. Faraday Soc.*, 45:940, London, 1949) therefore held good in methyl radical re-combination, but did not appear to apply to reactions between methyl radicals and saturated molecules.

Spectroscopy. Recent advances in experimental techniques, particularly in the measurement of small amounts of radiation, led to rapid progress in the knowledge of molecular vibrational and rotational energy levels. Micro-wave spectra (of wavelengths of from a few millimetres to a few centimetres) were successfully used in the study of the rotational energy levels of some simple molecules (*e.g.*, carbon monoxide, phosphorus trichloride and nitrous oxide) and the great accuracy and resolving power of the method clearly demonstrated. The results were applied to the accurate estimation of dipole moments (*e.g.*, of arsenic trifluoride, nitrous oxide and 1:1:1 trifluoroethane; see R. G. Shulman, B. P. Dailey and C. H. Townes in *Physic. Rev.*, 78:145, New York, 1950) and to the determination of potential energy barriers hindering free rotation about single bonds. Thus a value of 2,600 cal./mole was put forward for the barrier restricting the rotation of the methyl group in acetaldehyde (by Baird, see E. B. Wilson, *Faraday Soc. Discussion on Spectroscopy and Molecular Structure*, 112, London, 1950), and this determination was free from some of the uncertainties frequently associated with the sizes of potential barriers obtained from third law thermodynamic data.

Micro-wave data have a high precision, but recent work on the rotation-vibration spectra of some simple polyatomic molecules (*e.g.*, nitrous oxide; see G. Herzberg and L. Herzberg in *J. Chem. Physics*, 18:1551, New York, 1950) had shown that infra-red measurements could be obtained with almost comparable accuracy. A very long absorbing path was used to investigate the spectrum of nitrous oxide above 8,500 cm^{-1} and to determine accurate molecular constants such as moments of inertia and internuclear distances.

Measurements of infra-red and Raman spectra of many simple molecules led to convincing assignments of their vibrational frequencies. For instance, G. Herzberg and C. Reid (see *Faraday Soc. Discussion on Spectroscopy and Molecular Structure*, 92, London, 1950) made a detailed study of the infra-red and Raman spectra of cyanic acid and made a vibrational analysis in accordance with their data. There was still disagreement, however, in the assignment of some spectroscopically simple molecules, and D. H. Rank, B. D. Saksena and E. R. Shull (*ibid.*, 187) showed that the vibration frequencies of neopentane were still not definitely settled.

The study of some of the more complex organic molecules including hydrocarbons, alkyl halides and alcohols was simplified by a technique introduced by J. K. Brown and N. Sheppard. They demonstrated for example that the careful crystallization of 2:3 dimethylbutane caused a considerable simplification in its spectrum (see *J. Chem. Physics*, 19:976, New York, 1951) and showed that this was because of the presence in the lattice of only one isomer having a centre of symmetry. In the liquid state a number of extra absorptions appeared because of the existence of a second rotational isomer; the presence of these bands formerly made the vibrational assignment of this and other molecules very difficult. The energy difference between rotational isomers was obtained from the variation with temperature of the relative intensity of two vibrational bands occurring in the liquid substance, one belonging to each of the rotational isomers. This technique was first employed by A. Langseth and H. J. Bernstein (see *J. Chem. Physics*, 8:410, New York, 1940), but it was only after 1948 that it was exploited, particularly by D. H. Rank, N. Sheppard and G. J. Szasz.

Applications of Radioactive Tracer Methods. Two applications of radioactive tracer methods were made to the estimation of very small concentrations of materials. The vapour pressure of a solid down to pressures of less than 0.001 mm. of mercury can be accurately measured by labelling it with a radioactive isotope of one of the constituent elements. A calibration must be made at a higher temperature where the vapour pressure is measurable by some alternative means. The method was developed by F. S. Dainton and H. M. Kimberley (see *Trans. Faraday Soc.*, 46:912, London, 1950) and applied to the determination of the vapour pressure of white phosphorus.

The second application permitted the measurement of the adsorption of surface-active agents at a solution-air interface. The radioactive isotope of sulphur ^{35}S emits a soft beta-radiation and by incorporating it in, for instance, di-n-octyl sodium sulphosuccinate the concentration of this surface-active agent at a solution-air interface could be obtained (see D. J. Selley, A. J. Weith, Jr., A. A. Argyle and J. K. Dixon in *Proc. Roy. Soc.*, A203:42, London, 1950). The method was used to follow the extent of adsorption under various conditions, and opened up the possibility of studying the kinetics of such adsorption processes.

Theoretical Chemistry. Considerable progress was made in the understanding of various types of chemical reactivity. The greatest advances continued to be in the field of aromatic and conjugated molecules where π -electrons confer properties which are by comparison readily amenable to compu-

tation. C. A. Coulson, H. C. Longuet-Higgins *et al.* discussed the reactivities of many organic molecules in a semi-quantitative fashion, and were particularly successful with polycyclic hydrocarbons containing no odd-membered unsaturated rings. M. J. S. Dewar's predictions concerning the reactivity of tropolone towards electrophilic substitution were shown to be correct. In general, the theories of chemical reactivity merely resulted in an understanding of data already produced by the experimental chemist, but valuable predictions of a semi-quantitative type were also made. (K. E. RL.)

Steroids. The most interesting event of the year was the total synthesis of the steroid molecule, reported almost simultaneously by R. B. Woodward at Harvard university and by Sir R. Robinson at Oxford. The Harvard group started their synthesis at ring C with 2-methyl-5-methoxybenzoquinone, laid the foundations for ring D by a Diels-Alder addition of butadiene, and then built up rings B and A. The real brilliance of the work lay in the building up of the steroid molecule asymmetric carbon by asymmetric carbon, the reactions employed being devised to yield the desired steric configuration. Confirmation of the correctness of these predictions was only obtained after the full tetracyclic system had been built up, when direct comparison with a molecule derived from a natural steroid first became possible (see *J. Am. Chem. Soc.*, 73:2403, 3547, New York, 1951). This intermediate was subsequently converted to cholesterol and to cortisone (*ibid.*, 73:3548, 4057, New York, 1951).

The approach of Sir R. Robinson and his collaborators, building up the molecule from ring A, led to the synthesis of epiandrosterone, from which most steroids may be derived (see *Chem. and Ind.*, 389, London, 1951).

Sir R. Robinson and C. A. Friedmann (see *Chem. and Ind.*, 777, London, 1951) reported progress in what might be developed into a satisfactory method for the commercial production of cortisone by total synthesis. Improvements were made in the partial syntheses of cortisone, and the search for suitable starting materials in plants and micro-organisms continued.

Auxins. A considerable body of opinion unfavourable to the structures proposed by F. Kögl and his collaborators for auxins *a* and *b* was developing (*e.g.*, see H. Linser in *Planta*, Berlin and Heidelberg, 1951). Efforts by Kögl to repeat the isolation of auxin *a* or auxin *b* had so far been unsuccessful. The simple cyclopentenyl analogue of auxin *b* was independently synthesized by Kögl and de Bruin (see *Rec. Trav. Chim.*, 69:729, Amsterdam, 1950) and by E. R. H. Jones *et al.* (*J. Chem. Soc.*, 3634, London, 1950). The English workers pointed out certain important differences between the chemical properties of the synthetic compound and those reported for auxin *b* itself.

Vitamin A₂. The synthesis of this vitamin was accomplished (see E. R. H. Jones *et al.* in *Chem. and Ind.*, 49, London, 1951); its structure was thus clearly established as 3-dehydrovitamin A₁.

Sugars. The first *in vitro* total synthesis of the DL-pentoses was achieved by L. Hough and J. K. N. Jones (see *J. Chem. Soc.*, 1122, London, 1951). They obtained crystalline derivatives of DL-ribose, DL-lyxose, DL-xylose, and DL-arabinose by partition chromatography on a powdered cellulose column of a mixture produced by the condensation of dihydroxyacetone and glycolic aldehyde in alkaline solution. Hydrolysis of the DL-arabinose benzoylhydrazone yielded crystalline DL-arabinose: since DL-arabinose may be resolved via its menthylphenyl hydrazone (see C. Neuberg, *Ber. D. Chem. Ges.*, 1905), this constituted a total synthesis of D-arabinose and L-arabinose. This synthesis furthermore led to interesting speculations on the mechanism of the synthesis of sugars in the plant.

The authors considered that the resolution was due at least in part to the asymmetric character of cellulose. (See also *ATOMIC ENERGY; BIOCHEMISTRY.*) (G. F. SM.)

See Sir Cyril Hinshelwood, *The Structure of Physical Chemistry* (Oxford, 1951).

CHESS. The outstanding event of 1951 was the world championship played at Moscow between Mikhail Botvinnik, the title holder, and David Bronstein. The match was drawn (12-12) and the holder retained the title.

A new series of zonal tournaments commenced immediately afterwards in Germany. Zonal A at Bad Pyrmont was won by S. Gligoric (Yugoslavia), by one point from W. Unzicker (Western Germany). A British master, H. Golombek, occupied fifth place (five players qualify for the interzonal). Zonal B was played at Marianske Lazne and was won by L. Pachman (Czechoslovakia) by one point from L. Szabo (Hungary).

In Great Britain, 1951 opened with an undistinguished Hastings tournament won by W. Unzicker from A. O'Kelly (Belgium) and N. Rossolimo (France). Of greater interest was the Staunton Centenary (Festival) tournament played at Cheltenham, Leamington and Birmingham. First prize was won by S. Gligoric with ten points, from V. Pirc, G. Stahlberg and P. Trifunović. An English master, F. Alexander, shared fifth prize. The British championship, at Swansea, was won by E. Klein, 1950 runner-up, from the holder, R. J. Broadbent. H. Golombek and W. Ritson-Mony shared third place. After this, a match was played in London between Great Britain and Yugoslavia on ten boards and won by Yugoslavia by 12½-7½. A small tournament at Paignton was won by H. Golombek.

In the United States, both the open championship and the U.S. championship were won by a young player, Larry Evans, who finished ahead of I. Kashdan in the former event and the famous F. Reshevsky in the latter. (G. As.)

See Edward Lasker, *Modern Chess Strategy* (rev. ed., London, 1951); I. König, *Chess from Morphy to Botvinnik* (London, 1951); Gerald Abrahams, *The Chess Mind* (London, 1951).

CHILD LABOUR: see *YOUTH EMPLOYMENT.*

CHILDREN'S BOOKS. During 1951, fairy stories, original and traditional, continued to cast their spell. Children delighted in the imaginative qualities of *The Faun and the Woodcutter's Daughter* by Barbara Leonie Picard and the Chinese tales in *The Peach Blossom Forest* by Robert Gittings and Jo Manton. They found fantasy and adventure ingeniously blended in *The Dark Sailor of Youghal* by Patricia Lynch, *The Valley of Song* by Elizabeth Goudge, *Prince Caspian* by C. S. Lewis and *The Flag from the Isles* by William Croft Dickinson. They appreciated the droll Finnish humour in *Comet in Moominland* by Tove Jansson, the finely perceptive imagery in *The Mousewife* by Rumer Godden and the animal characters in *Doctor Dolittle and the Green Canary* by Hugh Lofting, who died in 1947.

English history was re-created in several stories with good characterization and interesting detail, including *Jockin the Jester* by Ursula Moray Williams and *The Gauntlet* by Ronald Welch (both 14th century), *The Wool-Pack* by Cynthia Harnett (15th century) and *The Armourer's House* by Rosemary Sutcliffe (16th century). *Knave-go-by* by C. Fox Smith, *The Lintowers* by Elisabeth Kyle and *The Young Inverey* by John Niven were vigorous adventure stories with a period setting.

Among several stimulating career stories, mining was depicted with accuracy and understanding against a background of mystery in *The Whinstone Drift* by Richard Armstrong, journalism in *The Monday Story* by James Leasor and teaching in *First Year Up* by D. W. Hackman.

Boys read about the wanderings of a poor lad and his cat in *The Cat Did It* by Brian Fairfax-Lucy, day-school life in *Barry's Exciting Year* by A. Stephen Tring and country pursuits in *Rough Water* by Roland Pertwee. They found humour in *Timpetill* by Manfred Michael and stark realism in *The Long Arctic Night* by Kurt Schmeltzer, both originally published in Switzerland. Adventure and suspense at sea was the theme of *Thunder in the Bay* by Adrian Seligman. Modern science provided thrills in *Sunday Adventure* by John Pudney.

Girls appreciated the building up of atmosphere in *The Dark Lantern* by Viola Bayley, the happy family relationships and Scottish background of *The House at Kilmartin* by Ann Bridge and the vicissitudes of an early Victorian theatrical touring company in *Family Playbill* by Pamela Brown. They enjoyed the sensitive study of a child artist in *Picture Come True* by Priscilla Warner and the activities of amateur detectives in *The Jennifer Jigsaw* by Shirley and John Newton Chance. Gardening formed a satisfying background to *The Dog-Leg Garden* by Dorothea Street and skating was featured in *White Boots* by Noel Streatfeild. *Four Rode Home* by Primrose Cumming and *Cargo of Horses* by Monica Edwards were outstanding among pony stories with human as well as equestrian interest.

Much thought and artistry went into children's picture books. Colour lithography was effectively used in Edward Ardizzone's *Tim and Charlotte*, Sergei Prokofiev's *The Story of Peter and the Wolf* and Clarke Hutton's *A Picture History of France*.

Informative books were popular and helped to satisfy curiosity on many subjects. Young children were attracted by the clear, colourful drawings and simple text of *How the First Men Lived* by Marie Neurath and J. A. Lauwerys. *Come out of Doors* by C. D. Dimsdale and *Pond Life* by Richard L. E.

A drawing by Pauline Baynes, from "Prince Caspian" by C. S. Lewis (Geoffrey Bles, 1951).

Ford were well-illustrated contributions to nature study. A revised edition of *The Animal's World* by Doris L. Mackinnon presented simple facts on zoology. *Flip* by Joan Wanklyn told the story of an otter. Children with a taste for travel books read *The Young Traveller in China* by C. E. Roberts and *Wall of Spears* by Mildred Cable and Francesca French. Interesting facts were assembled in *London Adventure*, a guide to London, by Margaret M. Pearson. Practical books on sports and hobbies included *The Junior Woodworker* by Charles H. Hayward, *Cooking is Exciting* by Lady Peacock and *Soccer for Boys* by F. N. S. Creek.

Among biographical works were *Sir Walter Raleigh* by Hugh Ross Williamson, and Lord Mountevans' own story of his early career in *Happy Adventure*.

Fine poetry was represented by Eleanor Farjeon's selection of her best verse in *Silver-Sand and Snow* and drama by *Beauty and the Beast* by Nicholas Stuart Scott. Geoffrey Trease helped children to appreciate good books in his *Enjoying Books*.

Several classics appeared in attractive new editions, including *Lorna Doone*, illustrated by Lionel Edwards, and *Fairy Tales from the Arabian Nights*, illustrated by Joan Kiddell-Monroe. The Library association Carnegie medal was awarded to Elfrida Vipont for *The Lark on the Wing*.

(D. D. C.)

United States. Children's picture books ranged from pastels to startling colours. The Caldecott winner, Leo Politi, reminisced in *Little Leo*, and W. Lipkind and N. Mordvinoff produced *Finders Keepers. Me and the Bears* by Robert Bright was appealing. Originality of plot, vigour of illustration and humour characterized *The Camel who took a Walk* by Jack Tworokov, *Polly's Oats* by Marc Simont and *Mr. T. W. Anthony Woo* by Marie H. Ets. Enjoyable stories to be read to the six to eight-year-old were *The Horse who had his Picture in the Paper* by Phyllis McGinley and the account of the New Year's mummer's parade in *Patrick and the Golden Slippers* by Katherine Milhous. This younger age also was introduced to space through *Ups and Downs* by Ethel S. Berkley and to movement in art in *What's in a Line?* by L. P. Kessler. Easy-to-read pioneer books included *Caroline and her Kettle named Maud* by Miriam E. Mason and *Broncho Charlie* by Henry V. Larom. Among nature books were Olive L. Earle's *Thunder Wings* (ruffed grouse) and R. M. McClung's *Stripe* (chipmunk).

Boys and girls of 10-12 enjoyed *The Wishing Pear* by Elizabeth Coatsworth (New Amsterdam, 1664) and the family story of *The Golden Root* by William O. Steele (Tennessee, post-Revolution). Biography and legend for this age was represented by *Andrew Jackson* by Geneviève S. Foster and *The Apple and the Arrow* (William Tell) by Mary and Conrad Buff. Humour characterized *Miss Pickerell Goes to Mars* by Ellen MacGregor and *Gertie, the Horse who Thought and Thought* by Margarite Glendinning. Stimulating to inquiring minds were *The Great Whales* by Herbert S. Zim and *Minn of the Mississippi* by H. C. Holling. Stories about children of different racial groups included *Tansy for Short* by Ruth L. Holberg (Norwegians), *The Quarry Adventure* by Lee Kingman (Finns), *Elder Brother* by Evelyn S. Lampman (Chinese) and *Carol's Side of the Street* by Lorraine Beim (Jews).

Books with an historical setting for older boys and girls ranged from prehistoric times in *Fire-Hunter* by Jim Kjelgaard, to biblical Persia in *Behold Your Queen!* by Gladys Malvern, to 14th-century England in *Three Golden Nobles* by Christine Price and to the American scene in *Unwilling Pirate* by West Lathrop (1720). There were several unusual animal stories for the mature reader, including one by a Russian-American, Nicholas Kalashnikoff, *The Defender* (a shepherd and his rams). Kenneth C. Randall wrote of hunting dogs in *Wild Hunter* while William M. Rush did an above-average story in *Wild Horses of Rainrock*. Boys kept abreast with some of the latest developments in science through *Rockets, Jets, Guided Missiles and Space Ships* by Fletcher Pratt and *Aircraft U.S.A.* by H. E. Huntington. Katherine B. Shippen's *Leif Eriksson* was a mature biography; so was *Of Courage Undaunted* by James H. Daugherty (Lewis and Clark), while younger teenagers read *America's Robert E. Lee* by H. S. Commager.

(E. G.)

CHILD WELFARE. In 1951, administrative action consolidated previous legislation. The counties, to whom the child welfare services had been transferred as a result of the National Health Service act, 1948, achieved uniformity of control by appointing local medical officers of health as county assistants for the purpose of the personal health services, including the supervision of child welfare, school medical work, midwifery, health-visiting and the after care of the sick. An attempt was made to increase the number

of dentists available to treat children, by the appointment of dentists to the staff of counties and county boroughs.

The effects of the National Health service were of increasing benefit to young children, for mothers realized that they no longer had to consider their purse before calling in medical attention. Before the passing of the act, national insurance only covered treatment for employed men and women. The health of the children of the country remained at a high level. The infantile mortality rate for England and Wales, which in 1939 had been 51, dropped to 34 in 1948, 32 in 1949 and 30 in 1950. The incidence of serious infectious disease was low although notification of measles and whooping cough was higher than in 1950. There were fewer cases of poliomyelitis and notifications under new legislation distinguished between paralytic and non-paralytic cases. Immunization against poliomyelitis was less effective than in 1950 but a low incidence of mortality from diphtheria showed the satisfactory effects of immunization.

Jurisdiction under the Guardians of Infants act was extended. It increased maintenance allowances to 30s. a week and extended them to full-time students between the ages of 16 and 21.

The Administration of Children's Homes regulations, which came into force on Sept. 1, were calculated to secure the material and spiritual welfare of children in Homes provided by local authorities or voluntary associations. The regulations stipulated a monthly visit by a member of the Children's committee of the local authority, adequate facilities for religious instruction, the appointment of a medical officer and suitable arrangements for dental treatment. They also required the immediate notification of the death of any child in a Home and reports of the outbreak of gastro-enteritis, or any other infectious disease.

The regulations authorized the secretary of state to give instructions concerning the number of children to be accommodated in a voluntary home and to prohibit the provision of certain types of clothing. He had also to satisfy himself as to the provision made for visits by parents and guardians.

The public became aware during 1951, however, that there were a number of children who were not being looked after satisfactorily by their own parents, and there were many who considered that the penalties awarded against parents who did not provide proper care and attention for their children, or were cruel to them, were not a sufficient deterrent. On the other hand, on the plea that many mothers carried out their duties inadequately because of ignorance rather than wilful neglect, a Home was opened by the Salvation Army at Plymouth, where mothers, together with their children, were taught house management and the care of children. The object was to cure rather than to punish.

Paediatricians welcomed the late Sir Leonard Parsons' book *Modern Trends in Paediatrics* (London, 1951), and of special interest was the Dawson Williams trust lecture delivered by Professor Alan Moncrieff at the annual meeting of the British Medical association. In this lecture the child welfare services in England were reviewed and an indication given as to how they might be improved. (D. H. G.)

United States. Child welfare planning was advanced by federal, national, state and local organizations, several of which were created to carry out objectives of the Midcentury White House Conference on Children and Youth. On May 28 a new National Midcentury Committee for Children and Youth held its first meeting. Day care of children of working mothers received the attention of many organizations. Late in 1951 nearly 5 million mothers with children under 18 years of age were employed outside the home. The Child Welfare League of America, co-operating with other national and federal agencies, completed a nation-wide review of day care resources. Special studies of the need for this type

of child care were made in communities where defence industries sought large numbers of women workers. The Child Welfare league expanded its staff of day care consultants.

Aid to dependent children, with larger grants than in 1950, constituted the country's most effective single measure for prevention of family breakdown and severe neglect of children. In June 1951 there were 1,617,893 children whose 632,649 families thus were spared distress or complete disruption.

Increased narcotics addiction among youth in large cities received widespread attention from child welfare and law-enforcement authorities during 1951. Many organizations issued statements on the subject and participated in efforts to combat the illicit sale of narcotics and to develop services for treating young addicts.

International Services. "Health for Your Child and the World's Children" was the central theme for the observance of World Health day on April 7, 1951. A practical step towards realization of this goal was the development of a world-wide co-ordinated programme, one of the principal achievements of the fourth World Health assembly held in Geneva, May 7 to 25. Regardless of the sources of funds available, the integration of services in 1952 was to include activities of three of the specialized agencies of the United Nations, the U.N. International Children's Emergency fund (U.N.I.C.E.F.), the Programme of Technical Assistance for Economic Development and the World Health organization (W.H.O.). The W.H.O. fixed its effective working budget for 1952 at \$7,700,000, in contrast with the \$6,300,000 available in 1951.

The U.N.I.C.E.F. completed in 1951 its fifth year of operation and the first year under policies revised in accordance with a resolution adopted by the general assembly of the United Nations on Dec. 1, 1950, and a budget which was a small fraction of the amount spent annually during the first years of the fund's existence. Typical of the programme of the U.N.I.C.E.F. was its provision of supplies and equipment for a two-year maternal and child health project in Burma, begun in 1951, in collaboration with the W.H.O., which provided a team of 12 international experts to establish a pediatric department in the Rangoon General hospital; increase the diagnosis and treatment of syphilis in mothers and children; reorganize the children's ward of the Rangoon General hospital; and expand school health services.

International conferences in 1951 significant to the welfare of children included the International Catholic Child bureau, Madrid, April 26-30; the fourth World Health assembly, Geneva, May 7-25; the World Assembly of Youth, Ithaca, New York, Aug. 5-16; the second International Poliomyelitis conference, Copenhagen, Sept. 3-7; and the fifth World Congress of the International Society for the Welfare of Cripples, Stockholm, Sept. 9-14. (See also **JUVENILE DELINQUENCY; YOUTH EMPLOYMENT.**) (H. W. Hk.)

Beck, *Five States, Study of Youth Authority Programs Promulgated by the American Law Institute* (New York, 1951); Lucien Bovet, *Psychiatric Aspects of Juvenile Delinquency* (New York, 1951); John Bowlby, *Maternal Care and Mental Health* (New York, 1951); Interdepartmental Committee on Children and Youth, *Programs of the Federal Government Affecting Children and Youth* (Washington, 1951).

CHILE. Republic occupying the Pacific coast of South America for about 2,600 mi. and having an average width of only 110 mi. Chile is bounded on land N. by Peru and E. by Bolivia and Argentina. Area, 286,323 sq.mi. Pop.: (1940 census) 5,023,539, (mid-1951 est.) 5,877,000. The racial composition, largely of European origin, includes *mestizos* (15%) and Indians (4.2%). Language: Spanish. Roman Catholicism is the predominant religion. The capital is

President Gabriel González Videla (right) with Trygve Lie, secretary general of the United Nations, at Viña Del Mar, Chile, Feb. 1951.

Santiago (pop., including suburbs, 1950 est., 1,200,754). Other chief towns (pop., 1946 est.): Valparaíso (198,068); Viña del Mar (98,156); Concepción (87,620); Antofagasta (47,326); Talca (44,859). President, Gabriel González Videla.

History. During 1951 Chile remained politically stable, continued its economic improvement and reaffirmed its democratic principles. The government was faced with strikes among employees in February and in the copper industry in June. A 6c. per lb. increase in the price of copper, to 30½c. per lb., as a result of trade negotiations with the United States made it possible to pay better wages in the copper industry. This increase was expected to produce an additional income of \$77.5 million per year.

Early in the year at a meeting of the U.N. Economic and Social Council held in Santiago, the Chilean delegate, Eduardo Cruz Coke, suggested that Latin American deposits in U.S. banks estimated at \$800 million be used to guarantee loans to the governments of the Latin American republics in order to relieve the dollar shortage. At the same meeting another Chilean delegate, Francisco Labbe, praised the Point Four programme for the economic development of backward areas and recognized the fact that the United States was contributing 55% of the funds for this programme.

Eugene Black, president of the International Bank for Reconstruction and Development, visited Chile early in the year and agreed to make a complete study of Chilean industry and economy. Previously, President González Videla had attacked the bank publicly in a speech for its failure to assist in national economic development. Later the bank agreed to recommend a \$10 million loan for the mechanization of the coal industry and another \$2 million loan for power development. Another \$10 million loan for irrigation in north central Chile was postponed.

In his message to congress in May, President González Videla expressed confidence in Chile's political and economic future. He announced that the steel mill at Huachipato, built at a cost of \$87.5 million, was producing 236,000 tons of steel ingots yearly; a large ore smelter at Paipote would start operating shortly; and the nitrate industry would use a solar evaporation process for treating low-grade nitrate. This would increase the exploitable reserves and lower production costs. The only menace he saw to the nation's safety was from Communist infiltration.

Diplomatic relations were renewed with Venezuela, after a break of three years. Political parties started preparations

for the presidential election in Sept. 1952; Pedro Enrique Alfonso, former minister of the interior, won the Radical party nomination in the primary over Marcial Mora, formerly ambassador to the United States, and a five-party right wing coalition nominated Arturo Matte. (J. M.C.A.)

Education. Schools (1948): state primary, pupils 518,446; private and municipal primary, pupils 149,802; secondary, pupils 70,622. Higher education: University of Chile, students 5,287; Catholic university of Santiago, students 1,528; University of Concepción.

Agriculture. Main crops (1950-51, '000 short tons): wheat 1,080; barley 97; oats 98; rice, paddy 44; potatoes 396; (1949-50) beans 69; chick peas 41. Production of wine (1950): 86,300,000 U.S. gallons. Livestock (1950, '000 head): cattle, 2,331; (1949) pigs 585, goats 636, sheep 6,345. Wool production averaged 17,000 short tons a year, timber production about 275 million bd.ft. a year and landings of fish (including shellfish) about 70,000 short tons.

Industry. Manufacturing establishments (1948): 5,585, employees 296,000. Mineral production (1950, '000 short tons): iron ore 3,255.3; nitrate of soda 1,779.3; copper 399.9; manganese 37.2; mercury (lb.) 23,886; silver (troy oz.) 740,832; gold (oz.) 185,538; crude oil 100,152 cu.m. (about 550,000 bbl.). Manufactured goods (1950, '000 short tons): pig iron 120.7; crude steel 61.7; cement 565.3; cotton fabrics 23.5 million m. Electricity (1950): 1,524 million kwh.

Foreign Trade. Exports in 1950 (excluding gold) amounted to U.S. \$282 million and imports to U.S. \$248 million. Chief exports: copper bars (50%), nitrate of soda (25%) and wool (3%). Chief imports: machinery and vehicles (28%), textile fibres and cloth (13%), iron and steel and manufactures (9%) and sugar and derivatives (9%). Chief customers: U.S. (52%), Argentina (6%), U.K. (5%), France (5%) and Egypt (5%). Chief suppliers: U.S. (48%), U.K. (12%), Peru (7%) and Argentina (5%).

Transport and Communications. Railways (1949): 5,434 mi. incl. 3,859 mi. owned by the government. Highways (1947): 1,785 mi. international, 3,815 mi. national and 26,300 mi. provincial roads. Motor vehicles (Dec. 31, 1950): cars 40,098, lorries 27,507, buses 4,164. Merchant marine (1950): 88 vessels (100 tons and over) aggregating 169,349 gross tons.

Finance and Banking. (Million pesos). Budget: (1950 actual) revenue 18,887, expenditure 20,637; (1951 est.) revenue 23,257, expenditure 23,259; (1952 est.) balanced at 27,832. Currency circulation (July 1951): 6,414. Deposit money (July 1951): 15,007. Gold reserve (July 1951): U.S.\$ 45.2 million. Monetary unit: *peso* with an official exchange rate (Aug. 1951) of 3.125 U.S. cents and a free rate of 1.069 U.S. cents; £1=86.80 pesos (official). (J. W. Mw.)

CHINA. The most populated and second largest country of the world, China is a people's republic in Asia bounded N.E., N. and N.W. by the U.S.S.R., W. by Afghanistan, S.W. and S. by India and S. by Nepal, Bhutan, Burma and Indochina. The table below shows how the total area of 3,876,956 sq.mi. is composed, and the distribution of population (no complete census was ever taken):

	Area (sq.mi.)	Population
China proper (18 provinces)	1,444,626	409,137,000 (1936 est.)
Inner Mongolia (4 provinces)	326,285	5,143,000 (1936 est.)
Manchuria	503,127	43,234,000 (1940 census)
Western China (Sinkiang, Chinghai and Sikang)	1,118,323	6,524,000 (1936 est.)
Formosa (Taiwan) (q.v.)	13,857	5,872,000 (1940 census)
Kwantung (incl. Port Arthur)	1,444	1,750,000 (1938 est.)
Tibet (q.v.)	469,294	3,000,000 (1948 est.)
Totals	3,876,956	474,660,000

According to the official estimate of April 1950 the total population of China was 475 million. Language: Chinese, with a number of dialects, the most important being the Mandarin (or *Kuanhua*) which dominates nearly four-fifths of China proper. Religions: Confucianism, Taoism and Buddhism; about 10% of the population is Moslem; there are also Chinese Christians of various denominations. Chief towns (pop., 1948 est.): Peking (cap., 1,721,546); Shanghai (4,630,385); Tientsin (1,772,840); Canton (1,128,165); Nanking (1,113,972); Mukden (1,021,057); Chungking (985,673); Tsingtao (850,308); Harbin (760,000); Hankow (721,598); Sian (628,449); Dairen, under Soviet occupation (543,690).

The library of the workers' palace of culture which the people's government opened in Peking.

During the year China continued to have two governments: (1) the Communist, formed in Peking on Oct. 1, 1949, with Mao Tse-tung (q.v.) as president of the republic (chairman of the central people's government council) and Chou En-lai as prime minister (chairman of the state administrative council) and minister of foreign affairs; (2) the Nationalist, headed by Generalissimo Chiang Kai-shek, which in Dec. 1949 was moved from Chêngtu to Taipei, Formosa.

History. Any attempt to survey events in China in 1951 was hampered by the closeness of the "bamboo curtain," the fear among Chinese to speak to once intimate foreign friends and the overshadowing of everything by the war in Korea. It was impossible not to think that Korea had become a heavy tax on China's economy. Even before the North Koreans invaded South Korea, defence costs were 39% of the Chinese budget, and China no doubt ran up an enormous bill with the Soviet Union for armaments. Added to this there was the government determination to industrialize China so as to raise its standard of living, the plant for which must also be bought abroad. To combine this with the maintenance on a war footing of 7,000,000 regular troops and militia seemed almost impossible for a country like China, poor in metals and oil and predominantly agricultural.

In domestic affairs the Communists undoubtedly achieved much. Their political system seemed to have insured them against any relapse on the part of Red generals into the old warlordism. Beggars had been swept from the streets of big towns. Justice in Chinese courts was described as "rough and ready" but fair-minded. Trains were punctual and well-managed. On Sept. 16 the first section of the new Chungking-Chêngtu railway (about 100 mi.) was opened to traffic. On Oct. 17 Peking reported that all China's 22,600 km. (14,125 mi.) of railway were in perfect working order. It was also reported in June that the conservancy of the Huai river, begun by the Nationalists, was approaching completion: this would save millions of acres from annual flooding. Throughout the year increased production was reported from Peking in silk, tea, cotton, cereals and metallurgy. Some doubt was thrown on the cotton reports by an appeal by

Chou En-lai, the prime minister, to the farmers to drop their strike against the government prices which was endangering work in the mills. According to trustworthy reports, the new Communist currency had not penetrated to rural districts and farmers were holding up produce for barter. Cultural activities figured prominently. A research institute under Mei Lan-fang, the famous actor, was created to adapt old plays to "the changed ideas and life of new society"; as also theatrical and cinema schools to train young actors and produce new plays and films on similar principles. Cultural agreements were signed with Poland, Czechoslovakia and Eastern Germany. One interesting report was of renewed excavations southwest of Peking for "Peking Man" and the recovery of valuable fossils and domestic implements.

The darker side of life was the mass executions all over China following on a decree by Peking on Feb. 22 for drastic punishment of counter-revolutionaries. In Shanghai and Canton public trials (fully publicized by the Chinese press) were held before huge mobs howling for the victims' blood. But no city was exempt. By November, when Communist reports indicated that 1,200,000 victims had perished, the purge was slowed down, in view of protests that as many innocent people had died as the guilty. Throughout the year there was much evidence of mutinousness among peasants against the uneven working of land reform, taxation and confiscation of grain for townfolk and army. But by the end of the year it was generally agreed that the dictatorship of the central people's government council had greatly strengthened its grip on all China. Reports that children were being taught to accuse, and did accuse, their parents of counter-revolution, appeared to be true.

Notable moves were made by Peking for closer relations with Asian powers. In January barter agreements were made with Pakistan to exchange coal for cotton; and with India for 37,000 bales of jute against 50,000 tons of rice. In April China offered India 1,000,000 tons of grain to meet the Bihar famine. Cultural missions were exchanged between India and China with effusive publicity on both sides. On March 8 Peking spontaneously assured Burma that it had no territorial designs on it, and Chou En-lai publicly repudi-

ated the Chinese maps which show Burma as Chinese territory. In Europe China sent exhibits to the Leipzig and Prague industrial fairs and to an arts exhibition in Berlin, in June; and in July 300 Chinese delegates were sent to the World Festival of Youth and Students. China also entertained a deputation of nine trade unionists from the Britain and China Friendship association in May; and 42 "youth delegates" from Australia, Argentina, Ceylon, Chile, Cuba and South Africa in November.

The fate of Tibet was finally decided in May when Tibetan delegates to Peking were forced to sign an agreement by which control of Tibet's foreign affairs, finance and army passed to China, while Tibet was promised religious freedom, the management of domestic affairs and the retention of the lamas' rights and property. An important clause was that the Panchen Lama, whose faction, resident at Sining in northwest China since his predecessor fled to China in 1923, had eagerly espoused the Chinese cause, was to be restored to equal rights and dignity with the Dalai. As Lhasa had never recognized the present Panchen, now a boy of 14, the Chinese intention to play off one Holiness against the other was obvious. It was generally expected that the Dalai, who had retreated to Yatung in Dec. 1950, would withdraw into India. But India would only admit him as a private person, and in August he returned to Lhasa. By the latest information the Chinese were making roads, erecting wireless stations and planting garrisons along Tibet's southern border.

On March 6, L. H. Lamb replaced Sir John Hutchison in Peking to negotiate resumption of diplomatic intercourse, but Sino-British relations had shown no improvement. On Feb. 7 the British consul general and his staff at Tihwa, Sinkiang, were expelled for alleged espionage, with harshness and indignity. The British consulates in Chungking, Kunming, Hankow, Nanking, Tsingtao and Amoy were closed in May leaving only those at Shanghai, Canton and Tientsin. On April 30 and again on Sept. 1, Great Britain protested to Peking against the mistreatment of British subjects—especially the imprisonment of several without trial, all access to them being denied—but without effect. The pressure on foreign missionaries to withdraw from China, already

A parade of women in Shanghai in April 1951, protesting against the United States proposal to conclude a peace treaty with Japan. The banner reads "Oppose the American plan to re-arm Japan."

Leading members of the Chinese people's government at the 1951 May day parade in Peking. (Right to left), Chou En-lai, prime minister and foreign minister; Mao Tse-tung, president; Chu Teh, vice president and commander in chief; Liu Shao-chi, vice president and secretary general of the Communist party; Kuo Mo-jo, deputy prime minister and president of the Academy of Sciences; and Li Chi-sen, vice president. In Dec. 1951 Kuo Mo-jo was awarded an international Stalin prize.

widespread in 1950, became harsher and more direct in 1951. Many missionaries were arrested and subjected to hours of relentless questioning on charges of spying for the imperialists. Some were put in prison and their fate was unknown. All mission colleges, schools and hospitals were taken over by the government and acceptance of subscriptions from abroad was forbidden. Perhaps the most revealing fact was the decision in August of the China Inland mission, the largest, most deeply rooted mission in China except the Roman Catholic, to withdraw all its remaining members. In October the expulsion of Archbishop A. Riberi, apostolic delegate in China, on charges of espionage, indicated that Roman Catholics were being equally persecuted. In April, a conference of the Protestant churches called by the government, when the delegates were ordered to hunt out and denounce all Christians suspected of reaction, was one among many signs of the Communists' aim to use the churches as a political instrument.

In April Peking announced that for the first time for 73 years China had in 1950 a favourable trade balance. Emphasis was laid on the swing-over in business to the Soviet Union and its satellites, with which by 1951 three-quarters of all China's foreign trade was done. The stoppage of all U.S. exports to Hong Kong which could conceivably be used in war, and new restrictions imposed in Hong Kong (especially severe penalties for smuggling) and Singapore, naturally caused China to turn to the Soviet Union. China's sea trade with the outer world dropped to its lowest ebb since the "liberation," though there appeared to be a considerable land trade with Manchuria.

Shanghai as a seaport, once one of the greatest in the world, was practically dead. The British community, more than 10,000 before World War II, sank during the year to about 700. In Tientsin 33 British firms were still in existence, in Hankow about 100 British businessmen. Beginning on Dec. 28, 1950, the government seized all U.S. assets in China, including the power company and telephone company in Shanghai, and froze all U.S. deposits in Chinese banks. On April 29 the government also seized the installation tanks,

barges, lorries, etc., of the (British) Asiatic Petroleum company (A.P.C.) at Shanghai, in retaliation for Hong Kong's seizure of a former Japanese tanker which China claimed. As usual, however, with all foreign firms, the A.P.C. was forced to continue paying the wages of the whole Chinese staff. This injustice was heightened by new regulations in June making the head of every firm personally liable for claims of any kind against the firm. In October the Communists seized the Shanghai racecourse, formerly the chief centre of cricket, football, polo, tennis and bowls besides racing. On March 31, 1951, the *North China Daily News*, over a century old and for many years one of the three leading papers in Asia, ceased publication. It had been stopped publishing foreign news picked up from B.B.C. broadcasts, and the proprietors refused to be a vehicle for Communist hand-outs. The editor, R. T. Peyton-Griffin, who joined the newspaper as a reporter in 1916, died at his desk of heart attack on Dec. 23, 1950.

Speculation as to the exact relations between China and the Soviet Union was rife during the year. The Peking press frequently extolled the help of Russian advisers in developing Chinese industry. Members of the government, however, in public speeches put the emphasis on what China had achieved by its own exertions. Thus, Chu Teh, the commander in chief, on the 24th anniversary of the founding of the Chinese Red army, devoted himself entirely to its accomplishments for "national independence and the people's democracy." And, on Oct. 23, Mao Tse-tung in an important speech on China's achievements clearly regarded "the solidarity and unity" between China and the Soviet Union as an alliance between equals. All the evidence was that the Communists' victories in China were won by their own efforts, which put them in an entirely different position from the satellite governments in Europe. China's association with Moscow seemed as close as it had ever been. But the general conclusion was that it was not a Soviet puppet. (O. M. G.)

Education. Four-fifths of the population was estimated as illiterate in 1937 and the position did not improve during World War II. In

1937 there were 229,911 elementary schools with 12,848,000 pupils, as against 2,794,000 pupils in 1911, but it was estimated that there were altogether 60 million school-age children. The Communist government claimed that in 1950 there were 400,000 elementary schools with 30 million pupils, 5,000 secondary schools with 1.5 million pupils and 227 institutions of higher education with 140,000 students.

Agriculture. In a country purely agricultural only 29% of the total area was arable land and only 20% was cultivated. Agriculture supported 70% of the population and contributed 80% of the national income. Small-scale farming predominated: by 1937 36% of farms were less than 1.5 ac. and 62% less than 4.3 ac. in extent. Only one-quarter of the arable area, however, was peasant-owned. Radical changes were said to have been achieved by the Communist land reform: according to the Peking government, about nine-tenths of all arable land had been handed over to peasants and farm labourers by the end of 1951. Rice was the main crop and the main food in the southern and central provinces, whereas in the north wheat, millet and kaoliang or sorghum predominated. Subsistence crops were more important than commercial and industrial products. There was little animal husbandry since land could ill be spared for it, and pasturage occupied no more than 1% of the arable land.

TABLE I. AGRICULTURAL PRODUCTION ('000 metric tons)
(22 provinces, China proper, and former Inner Mongolia)

	1931-37	1947	1948	1949*	1950*
Rice, paddy	50,065	46,507	46,524	37,500	42,850
Wheat	21,743	23,647	23,990	16,275	18,597
Barley	7,871	7,574	7,428	5,850	6,770
Maize	6,497	6,724	7,467	4,875	5,570
Oats	881	703	795	660	754

* Estimates based on percentages given by D. Nikolayev and I. Shcherbakov in their study "The Achievements of the Chinese People's Republic" (*Bolshevik*, Moscow, Sept. 1951).

China's needs in its two main crops were estimated annually at 52 million metric tons of rice and 25 million tons of wheat. Millet production in the 18 provinces of China proper amounted in 1936 to 6,437,000 metric tons and that of kaoliang to 7,271,000 tons. Manchuria produced in 1939 ('000 metric tons): kaoliang 5,092, soya beans 4,361, millet 3,888, maize 2,716, wheat 1,046, rice, paddy 767. Other crops in the 22 provinces were (1931-37 average; 1948 in brackets): sweet potatoes 18,525 (24,970), potatoes 1,907 (1,952), soya beans 6,093 (5,738), broad beans 3,018 (3,114), dry beans 2,723 (2,237), dry peas 3,190 (2,992). Sugar production amounted in 1948 to 360,000 metric tons in the 22 provinces and to 26,000 tons in Manchuria. The yearly average production of ginned cotton in 1931-37 was 680,000 metric tons; by 1948 it had decreased to 460,000 tons; in 1950, according to *Bolshevik* (loc. cit.) it was 630,000 tons and the 1951 production was claimed by the Peking Hsin Hua (New China) News agency to be the largest in China's history.

Livestock ('000 head, 22 provinces, Oct. 1947): cattle 18,200, pigs 59,510, sheep 10,450, goats 13,976, buffaloes 9,460, horses 2,033, asses 8,561, mules 1,905, poultry 209,335. In Manchuria there were in 1938 ('000 head): pigs 5,335, horses 1,800, mules 565, asses 620.

Industry. The country had no big mineral reserves except of coal (estimated in 1947 at 246,000 million metric tons). Iron ore reserves, estimated at 952 million tons, were insufficient to establish large-scale industry. Known reserves of lead and zinc ore were also small, but copper was more abundant. Only of antimony and tungsten was China a leading producer.

TABLE II. INDUSTRIAL PRODUCTION
('000 metric tons, including Manchuria)

	1936	1947	1948	1949	1950*
Coal	41,900	14,148	8,720	15,500	18,755
Iron ore	3,360	150	158	364	2,100
Pig iron	1,535†	40	11	94	1,071
Crude steel	810	57	44	83	647
Tin concentrates	10.8	4.1	4.9	4.3	—
Cement	710†	749	550	145	550
Electricity (million kwh.)	3,130‡	3,120	2,860	—	—
Cotton yarn	394	299	336	200	457

* Estimates based on percentages given by *Bolshevik* (loc. cit.).
† 1935-39. ‡ 1938.

The New China News agency announced in March that the gross industrial output of 1950 exceeded that of 1949 by 117.3% compared with a 44.1% increase for the agricultural production. On Dec. 26, 1951, the same source announced the over-fulfilment of the 1951 plan. The production of pig-iron was 26% higher than in 1950, of cement 23.2%, of cotton yarn 22.4%, of rubber shoes 37%, of copper wire 41.9%, of electric bulbs 32.2% and of electric motors 81.9%.

Foreign Trade. The small foreign trade was typical for a poor agricultural country, exports consisting mainly of raw materials and imports of industrial products and food. The balance of trade was

constantly adverse, but the New China News agency claimed in April 1951 that in 1950 a favourable export balance of 9.34% was achieved for the first time since 1877. There was also a shift of trade from the western world to the Soviet Union and its satellites. In 1947 the United States supplied 50% and Great Britain 6.8% of Chinese imports, whereas the main destinations of exports were: Hong Kong 34%, the United States 23% and Great Britain 5%. In 1950 the Soviet Union supplied 19.8% of all imports and the European satellites, mainly Poland and Czechoslovakia, 1.37%. The corresponding figures for the first nine months of 1951 were given as 44.7% from the Soviet Union and 25.3% from the satellites. The export figures for 1950 were 26.6% of total exports to the Soviet Union and 3.87% to the satellites, and 51.5% and 26.4% respectively in 1951. Among the goods imported in 1950 industrial equipment and raw materials for industrial production constituted 78% of the total. Principal exports were soya beans, tea, eggs, hog bristles, tung oil, peanuts and antimony and tungsten ores. State companies were responsible for 53.3% of the total value of exports and 70.5% of imports. (See also HONG KONG.)

Transport and Communications. The railways were all single-track of small carrying capacity, and the system was wholly inadequate. By 1950 there were 22,600 km. of track in operation, no more than in Poland, a country of 30 times smaller area. The New China News agency claimed that 99% of passenger trains and 97% of goods trains were running to schedule and that in 1950 the Chinese railways had begun to show a profit for the first time. By 1950 there were 203,000 km. of roads, only twice as many as in Poland; only one-fifth of the highway system was surfaced and one-third was badly in need of repair.

Finance and Banking. Continued civil and foreign wars had never conducted to a balanced budget or a sound currency. The 1947 budget was estimated to be balanced at Chinese National dollars 46,004,100 million, but the revenue amounted to only C.N.\$ 12,135,000 million. By 1948 the C.N.\$ was almost worthless and a new currency, the gold yuan, was introduced with an exchange ratio of C.N.\$ 3 million per gold yuan. At the end of 1949 the People's Bank dollar or *jenminpiao* replaced the gold yuan with an exchange rate of JMP\$ 1 = G.Y. 10. No figures of budget estimates or of currency circulation were published by the Chinese Communist government, but it seemed that the budget deficit continued to be covered by an increased note circulation. By mid-1950 the JMP\$ also collapsed and the U.S.\$ was officially quoted at JMP\$ 42,000. In Sept. 1950 it was announced from Peking that the *jenminpiao* was "stabilized" with an exchange rate of JMP\$ 31,000 per U.S. dollar. Evidence of hidden inflation in China was indicated to some extent by the black market exchange rate at Hong Kong, which by Oct. 1951 was JMP\$ 5,000 to HK\$ 1 (= 1s. 3d.) as against the official rate of JMP\$ 3,880. Serious inflation, however, was not shown in the cost of living. According to Peking, this increased during 1951 by 15% and in Shanghai wages increased by 12%. Participation in the Korean war no doubt had a disturbing effect on the country's weak economy, but the population were exhorted, as by the *Jen Min Jih Pao* (The People's Daily) on Jan. 1, 1951, to regard the consolidation of the national defence and broadening out of the struggle against imperialism as their primary task, coupled with that of economic construction.

"What can you do about it?" A cartoon by Mee Ku of the "Liberation Daily" (Peking) showing the Americans and their friends trying to shift the people of Asia shown on the rock.

CHRISTIAN DEMOCRATIC MOVEMENT.

For various reasons, the political strength of the Christian Democratic parties of Europe everywhere somewhat declined in 1951. In the postwar period they had been the most important political forces in western Europe, and the decline was partly a natural reaction against those who had been in power for some time, like Alcide De Gasperi in Italy or Konrad Adenauer in Germany. All the Christian Democratic parties were themselves coalitions of very different elements, containing within themselves a much broader scale from Left to Right than any other parties, and therefore tended to splinter. In most of the western European countries 1951 saw greater electoral success for right-wing movements, such as General Charles de Gaulle's *Rassemblement du Peuple Français* (R.P.F.), the "neo-nazi" *Sozialistische Deutsche Reichspartei* in Western Germany, or the "neo-fascist" *Movimento Sociale Italiano* (M.S.I.). Some of this success was ephemeral, but much of it was at the expense of the Christian Democrats.

Italy was the country where the weaker position of the Christian Democrats was least apparent; yet the local government elections in May and June showed that the combined Marxist vote in Italy exceeded that of the Christian Democrats for the first time since 1946—a point obscured by the fact that some of the Socialists contested the election in alliance with the Christian Democrats. The withdrawal of the Socialist members of the government coalition in April was a sign of weakness rather than of strength in the Christian Democratic position, and, although De Gasperi was able on July 26 to form his eighth consecutive government, the decline in his popular support was shown in the local government elections on May 27 and June 10, when the Christian Democrats polled 5,829,648 votes, or 38.7% of the total (48.7% in 1948 general election).

The French Christian Democrats of the *Mouvement Républicain Populaire* (M.R.P.) were completely estranged from the Socialists and from other parts of the so-called "third force" by the most melancholy feature of the year, which was the recrudescence of anti-clericalism that arose when the confessional schools provided the main political issue of the summer. In the general election on June 17 the M.R.P. secured only 97 seats, as compared with 164 in the previous assembly; nor could this be attributed to the working of the new electoral law, for the aggregate M.R.P. vote was only 2,353,544 as against 5,058,301 in 1946. In the local government elections held on Sept. 7 and 14 the M.R.P. gained 20 seats; this was at the expense of the Socialists and Communists, who lost heavily, but it was a small gain compared to that of 142 seats by the right-wing parties and 80 seats by the R.P.F.

In Austria, the Christian Democratic *Volkspartei* candidate, Heinrich Gleissner, was defeated in the presidential election on May 27 by the Socialist candidate, Theodor Körner (*q.v.*).

In the Landtage elections in Western Germany, held in the Rhineland-Palatinate, Lower Saxony and Bremen, the position of the *Christlich-Demokratische Union* was in every

case weakened, although in the Rhineland-Palatinate it remained easily the strongest party.

It was in Germany, at Bad Ems, that the fifth congress of the international Christian Democratic movement, the *Nouvelles Equipes Internationales*, took place in September. Some 250 delegates, from nearly every country of western Europe, took part under the chairmanship of Auguste de Schrijver, from Belgium; others who could not attend sent written contributions which were communicated to the delegates; these included T. S. Eliot. From the opening address by Chancellor Adenauer, to the closing resolutions, the *Leitmotiv* was the urgency of achieving a closer integration of Europe through the co-ordination of defence and industry; and it was characteristic that, among the flags of the participating nations, the central position over the entrance to the *Kursaal*, where the sessions were held, was occupied by the green and white "E" flag of the United Europe movement. The main speaker from the French M.R.P., Pierre-Henri Teitgen, summed up the feeling of the congress when he expressed disappointment that Great Britain had not yet become fully identified with the European movement, when France and Germany had deserved so well of Europe by the confidence and moral courage which had produced, for example, the Schuman plan.

Defining the Christian Democratic ideal as "to rescue the world from all forms of materialism and totalitarianism," the resolution passed by the congress declared that the defence of spiritual freedom was inseparable from the defence of political freedom and social justice. A message of sympathy for the victims of "barbarous measures" in eastern Europe was published, with a protest against the maintenance and extension of concentration camps and against the forced labour and deportations, calling upon the public opinion of the world to stop "these crimes against humanity." The message also expressed the hope that Europe, now cut in two by "the boundary line of freedom," might again be united and its nations returned to the community of free peoples. (*See also ELECTIONS.*) (M. DK.)

CHRISTIAN SCIENCE. Christian Science is the religion founded by Mary Baker Eddy in 1866. It is represented by the Church of Christ, Scientist, and consists of the Mother Church, the First Church of Christ, Scientist, Boston, Massachusetts, and its branches in the United States and 41 other countries. In 1951 there were also organizations, established in accordance with the by-laws of the Mother Church, at more than 100 universities and colleges. At the annual meeting a record membership of 3,049 branch churches and societies was announced.

Relief activities conducted during 1951 helped to alleviate food and clothing shortages in disaster areas. Substantial relief went to 15 countries; in addition, a gift of ploughs to India was made by churches in the United States. The Communist authorities of Eastern Germany banned Christian Science and closed its churches in March 1951.

Military camp welfare activities in the U.S. were expanded. By Aug. 1951 there were 12 Christian Science chaplains on

CHRISTIAN DEMOCRATIC PARLIAMENTARY REPRESENTATION
(Figures in brackets are those of the preceding election)

Country	Party corresponding to Christian Democratic	Date of last elections	Votes obtained	% of total votes	Seats obtained by C.D.s	Total no. of seats

active duty with the armed forces, including one in Korea. It was arranged that civilian workers should call at many military posts and hospitals.

Sales of the Christian Science textbook, *Science and Health with Key to the Scriptures*, by Mary Baker Eddy increased by 25% in a year. The demand for her writings was double that of ten years earlier. The circulation of daily, weekly, monthly and quarterly publications also reached new levels. Members of the board of lectureship of the Mother Church toured the far east, Alaska, Australia, New Zealand, Africa, continental Europe, the British Isles, Mexico, Cuba, Bermuda, the West Indies, the Panama Canal Zone, South America, the United States and Canada. They reported the widespread alleviation of the burden of sin and sorrow during their lectures, as well as the healing of lameness, deafness, blindness and cancer.

(G.E. C.)

CHURCHILL, WINSTON LEONARD SPENCER, British statesman (b. Blenheim palace, Oxfordshire, Nov. 30, 1874). For his earlier career see *Encyclopædia Britannica* and *Britannica Book of the Year 1951*. On Jan. 20-22, 1951, Winston Churchill was in Paris on his way back to England from a winter holiday at Marrakesh, Morocco; he met René Pleven, the French prime minister, Jules Moch, the defence minister, and Robert Schuman, the foreign minister. In a party political broadcast on March 17 he said that the Conservative party had decided, on national rather than party grounds, to bring about a general election as soon as possible. He had acquired in April another French-bred racehorse, *Satrape II*, a yearling colt, and on May 14 his *Colonist II* won the Winston Churchill stakes at Hurst park, Surrey. The fourth volume of his memoirs of World War II, *The Hinge of Fate*, was published in London on Aug. 3. He went on holiday on Aug. 15, to Annecy, France, and Venice, to paint and continue his memoirs, and returned on Sept. 12. Churchill signed the Conservative party election manifesto which was issued on Sept. 29 and gave an election broadcast on Oct. 8. He was re-elected for Woodford, Essex, with a majority of 18,579. Winston Churchill was received by King George VI on Oct. 26 and kissed hands on his appointment as prime minister and first lord of the Treasury; his cabinet was announced on Oct. 26, 27 and 30 (see *CABINET MEMBERS*); he retained for himself the post of minister of defence. When parliament opened on Nov. 6 Churchill underlined the gravity of the country's economic position. In the defence debate in the House of Commons on Dec. 6 he said that the theme of the government's policy would be the idea of deterrents rather than the idea of danger; in expressing his belief in the qualities of the new British .280 rifle design he said that he had himself fired both that rifle and the new American .30. Churchill visited Paris with Anthony Eden, Dec. 17-19, to explain to French ministers the point of view he would put forward in talks that had been arranged for him in Washington in Jan. 1952. Discussions with René Pleven and Robert Schuman dealt with N.A.T.O., Germany, the near east and the far east. He lunched, on Dec. 19, with General Dwight Eisenhower and at his invitation addressed the staff at Eisenhower's headquarters, S.H.A.P.E. He sailed from Southampton on the "Queen Mary" on Dec. 31 for his talks with President Harry S. Truman and for a visit to Ottawa.

CHURCH OF ENGLAND. The bishop of London (the Right Rev. Dr. J. W. C. Wand) was chairman at the "Week of Prayer for Christian Unity" meetings in Jan. 1951; crowded meetings were also held at Exeter. In Lent the bishop lectured on the Non-Juring Schism. The bishop's appeal for £750,000 for churches and schools reached over £525,000; the bishop of Southwark's appeal for £350,000

The Most Rev. Geoffrey Fisher, Archbishop of Canterbury (right), with the Right Rev. S. F. Falkner whom he had consecrated Bishop of Chelmsford, Feb. 2, 1951.

was met in full and the Salisbury diocese obtained £240,000 of the £250,000 that it needed.

During the winter many churches throughout the country suffered from lack of fuel. Repair of war-damaged churches continued: in London, St. Dunstan-in-the-West, St. Magnus-the-Martyr, St. Bartholomew-the-Less and All Souls', Langham place, were among the churches whose restoration was completed. The king of Norway was present at St. Olave, Hart street, at the laying of the restoration stone. A scheme for the reorganization of the 45 City of London parishes was announced: 24 would remain as parish churches with rectors appointed for life, and 15 would become guild churches with vicars, appointed for five years in the first instance, who would have special duties besides week-day daytime work in the City; 6 churches would not be rebuilt.

In April the Coronation stone, taken from Westminster abbey on Christmas day, 1950, was recovered in Scotland and returned to the abbey. The war-damaged chapter house was restored. A new constitution, giving the dean and chapter more control over the abbey officials, was adopted. The appeal for the repair of Chichester cathedral was over-subscribed by £5,000 (£40,000); the Salisbury cathedral appeal reached £43,000; the tower of Derby cathedral was restored; the repairs at York continued and the Five Sisters windows were restored; repairs were completed at Ripon and continued at Ely. At St. Albans, 15th- and 16th-century paintings were discovered in the Norman tower. Appeals for £20,000 for the tower of Worcester and for £35,000 for Exeter and Norwich cathedrals were made, and plans published for completing Liverpool cathedral. A controversy arose over the plans for the rebuilding of Coventry cathedral. A suggestion was made by some of the deans and by the bishop of Peterborough that state aid should be given to the cathedrals, to meet rising costs. At St. George's chapel, Windsor, a charge was introduced for the visiting public. During the year, services at the cathedrals were well attended all over the country. In the diocese of St. Edmundsbury and Ipswich the stipendary minimum for clergy was raised to £500.

Inspired by the Mission to London (1949), missions were held at Worcester and the neighbouring towns, at Reading by the Church of England Men's society, and at Bournemouth, assisted by the Church Army. Two thousand church-people took part in a pilgrimage to Canterbury as a demonstration against Communism. The Anglo-Catholic Progress, beginning at Oxford, visited 60 towns from Darlington to Truro and held a final rally at the Albert hall, London. The work of adult religious education was further promoted by the conversion of the 18th-century house of Moor park,

Farnham, Surrey, into a residential educational college, under the auspices of Canon R. E. Parsons.

Many cathedrals and churches were floodlit to mark the Festival of Britain (*q.v.*). The Festival opened at St. Paul's on May 3 with a service attended by the king and queen, the princesses, the prime minister and members of parliament, and the lord mayor and corporation of London; the service was addressed by the archbishop of Canterbury (*q.v.*). The Festival hall, on the south bank of the Thames, was opened by the king and dedicated by the archbishop. The bombed church of St. John, Waterloo road, London, was rebuilt and opened as the Festival church. Great crowds attended open-air services in Hyde park, and on St. George's plateau, Liverpool, and the primates of England (the archbishop of York), Ireland and Wales and the primus of the Scottish Episcopal church preached in Liverpool cathedral. Celebrations also took place at Warrington, Widnes, Southport and St. Helen's. At St. Albans processions organized by the Church of England Men's society went to the shrine of Britain's first Christian martyr. Exhibitions of books, plate and church art took place in the crypt of St. Paul's, at the Guild hall and at Lambeth palace. Religious drama was performed at Canterbury cathedral, at York minster and at Southwark, Norwich, Derby, Coventry and St. David's cathedrals. At Norwich the celebrations included lectures by Professor H. Butterfield of Cambridge, Sir Ernest Barker and others. A festival of the three choirs of Ely, Norwich and Peterborough cathedrals was held at Norwich. This should not be confused with the Three Choirs festival of Gloucester, Hereford and Worcester, which was held in 1951 at Worcester. At St. David's cathedral several Welsh choirs gave concerts.

On July 4 the queen and the princesses, and the lord mayor and corporation of London, attended a service at St. Paul's

when General Dwight Eisenhower presented the roll of honour of 28,000 U.S. servicemen, who had operated from Great Britain during World War II; the dean (Very Rev. W. R. Matthews) dedicated it. The archbishop of Canterbury preached, and dedicated the silver cross and candlesticks presented by the king to Washington cathedral.

The bishop of Derby's report on relations with the Presbyterian Church of Scotland was issued. It said that formidable difficulties prevented closer association between the two churches at present, but the discussions would continue.

Bishop E. R. Morgan (suffragan bishop of Southampton) was consecrated diocesan bishop of Truro in succession to Bishop J. W. Hunkin (d. Oct. 1950).

The convocations of Canterbury and York continued the revision of the canon law. A commission on ecclesiastical courts was set up with Mr. Justice Lloyd Jacob as chairman. Queen Mary attended the Church assembly at the spring session and formally re-opened the assembly hall at Church house, Westminster, which had been extensively damaged during World War II; she also unveiled two memorial panels. Five thousand pounds was voted towards the expenses of the Anglican delegates to the World Council of Churches (1954) and its committees, and £500 to the Central Readers board. At the summer session of the assembly a commission was appointed to report on the repair of churches and to secure regulation of them. Canon law revision was debated. The Diocesan Education Committees (Amendment) measure, 1951, the Bishops Retirement measure, the benefices (Stabilization of Incomes) measure, the Ecclesiastical Dilapidations measures (1923-29) Amendment measure and the Cathedrals (Appointed Commissioners) measure all received the royal assent. (*See also* ANGLICAN COMMUNION; MISSIONS, FOREIGN RELIGIOUS.) (A. J. MACD.)

See The Official Year-Book of the Church of England (London, 1951).

The 1951 spring session of the Church Assembly at the Church house, Westminster. The assembly which was opened by Queen Mary was meeting for the first time in the new assembly hall.

CHURCH OF SCOTLAND. The Church of Scotland at the beginning of 1951 had an increase of 2,932 in its communicant membership over the previous year; the number of elders was 38,692. The Christian liberality was £2,826,087 and the income £3,914,317. During the year the moderator of the 1950 general assembly, the Right Rev. Hugh Watt, toured north Africa, Egypt, Kenya, Malta and Germany and his successor in office for 1951, the Right Rev. W. White Anderson, visited Australia for six weeks. The office of lord high commissioner to the general assembly was filled by George Mathers, in the absence through illness of the Viscount Cunningham of Hyndhope.

The work of the church was reflected in the reports of committees to the general assembly. The foreign mission, faced with rising costs, estimated an expenditure of £345,000 and reported that the securing of candidates was slightly easier. The Home board reported intensive evangelical work through various agencies, the opening of 16 new extension churches at a cost of £204,400 and the erection of a further 22 at a cost of about £379,800. The Social Service committee reported continued work for social betterment provided by homes for children, hostels, and eventide homes; 15 of the eventide homes were maintained by this committee. No increase in the stipends of ministers was possible, and a call was made for an increase of one-third in congregational contributions to the Maintenance of the Ministry fund. The colonial and European work of the church continued effectively, though certain stations in Europe and in the colonies had to be closed down. Close contact was preserved with the other Reformed churches. The Church of Scotland through its Inter-Church Relations committee met the representatives of the Church of England to discuss relationships, and a joint report on the issues involved was published. The assembly of 1951 appointed an Iona Community board, as the governing body of the Iona community with the Rev. George F. MacLeod continuing as its leader. Important issues such as Communism, the re-marriage of divorced persons, and the "just war" were considered by the church and in the case of the first two issues reports by special committees were under consideration by presbyteries. The Church and Nation committee presented a wide survey of questions and policies both national and international and gave every evidence of the church's being alive and well-informed on matters of social, national and international import. Steps were taken towards the institution of services' kirk sessions in both Scottish and other units of the armed forces. (See also PRESBYTERIAN CHURCH.) (T. C.)

See G. D. Henderson, *The Claims of the Church of Scotland* (London, 1951).

CHURCH OF SOUTH INDIA. The Church of South India assumed its general form at a service held in the cathedral church of St. George, Madras, on Sept. 27, 1947, at which Christians in South India, who had previously belonged to separate communions, were united into membership of a single church by authorization of the governing bodies to which they had previously owed allegiance. These were the General Council of the Church of India, Burma and Ceylon (on behalf of the four Anglican dioceses entering the union), the General Assembly of the South India United Church (itself an earlier fusion, principally of Congregationalist and Presbyterian elements) and the South India Provincial Synod of the Methodist Church.

The North Tamil Church council of the South India United Church, numbering about 30,000 members, joined after the inauguration in 1947; a large group of Anglicans, estimated at about 25,000 members, in the Nandyal area of the former diocese of Dornakal decided finally not to participate and remained still under the jurisdiction of the metropolitan of

India. Apart from members of the Roman Catholic Church, the other principal groups outside the Church of South India were the Syrian Jacobite (600,000) and Mar Thoma (300,000) churches in Travancore (branches of the ancient, indigenous church, reputedly founded by the apostle St. Thomas) and the churches founded by western missionaries, from various countries, in the Lutheran and in the Baptist traditions. With the former, the C.S.I. was in official theological conversations, to explore the possibilities of eventual union. The Baptists had hitherto not sent official representatives to conferences, but had received an invitation from the synod of C.S.I. to do so if they wished. Thus in 1951 the Church of South India did not by any means comprise all of the non-Roman Catholic Christians in South India, but it represented a religious community of about one million souls.

The union of 1947 had been under discussion for some 28 years. In May 1919 a conference was held at Tranquebar, on the south coast, where the first Protestant missionaries landed in India in 1706. Nearly all the 33 delegates were Indians; their final resolutions already contained the basic principles upon which the later *Scheme of Union* was based, principles generally known as the Lambeth Quadrilateral (viz., the acceptance, as the basis for church union negotiation, of (i) the Holy Scriptures; (ii) the Apostles' and Nicene creeds; (iii) the sacraments of baptism and the Holy Communion; (iv) the historic episcopate). Negotiations began in 1920 between official representatives, and the following years saw many alternations of hope and despair on the part of those seeking union, and much diversity of opinion amongst those who watched or were consulted. The peculiar significance of the scheme, and the peculiar difficulties in which it was involved, arose from the fact that it was the first proposal to unite previously episcopal and non-episcopal traditions into an organic whole. In 1941 the 7th edition of the *Scheme of Union* was issued, upon the basis of which the union was finally consummated.

The Church of South India comprises 14 dioceses; the governing body is the synod, meeting every two years, of which the bishop in Madras (the Most Rev. Michael Hollis) was elected moderator in 1948 and re-elected in 1950. Continued conversations with a view to union with the Lutherans resulted, during 1951, in a statement by the C.S.I. Theological commission on the necessary and sufficient basis of union and a further joint conference based upon it. (O. S. T.)

CINEMA. The most dramatic gesture of 1951 in the film industry was the decision made by the Swedish producers in January to cease production altogether until the level of taxation on the industry in Sweden was lowered. This meant that an industry which had on a number of occasions achieved a world reputation was putting itself out of business because its position was, in its view, rendered intolerable. At the end of the year there were signs of renewed activity, and it was understood that the tax position was being reviewed by the Swedish government.

The chief film festivals were held at Cannes (at which the main awards went to Vittorio de Sica's *Miracolo in Milano*, Luis Bunuel's *Los Olyidados* and Alf Sjöberg's *Miss Julie*), in Berlin (where the Swiss film *Four in a Jeep* gained the *grand prix*), at Venice (where a Japanese film *In the Woods*, Jean Renoir's *The River* and Robert Bresson's *Journal d'un Curé de Campagne* won the chief awards) and at Edinburgh (a non-competitive annual festival). Great Britain had the

distinction of submitting the best general entry of documentary and specialized films at the Venice festival, in addition to winning many first prizes. The film festival for eastern Europe took place at Karlovy Vary, Czechoslovakia.

Great Britain. The close of 1951 found the British film industry in a slightly better position than it had been at the end of the previous year. At that time less than half the major studio space was occupied. The Association of Cinematograph and Allied Technicians (A.C.T.), the film-makers' union, estimated that the industry was then working at only 30% of its potential and that their members engaged in feature film production were lucky if they were in work for 20 weeks of the year. During 1951, however, two new schemes to develop production were implemented by the government. These were the group scheme of the National Film Finance corporation (which up to March 31, 1951, had had £6 million placed at its disposal by the Board of Trade for loans to film producers) and the British Film Production fund, commonly called the Eady plan after its originator, Sir Wilfrid Eady of the Treasury. The group scheme, announced in Jan. 1951, initiated three production groups, the first based on Pinewood studios, Buckinghamshire, and formed in association with General Film Distributors who agreed to guarantee 70% of production finance; the second based on Elstree, Hertfordshire, and formed in connection with the Associated British Picture corporation; and the third—a group under the general supervision of John Grierson and John Baxter, providing opportunities for young and unknown film-makers to produce special low-budget feature films—based on Southall studios, Middlesex. Sir Michael Balcon became chairman of both the first and third group companies. By the end of 1951 Group Three had three productions completed and two more in progress. The N.F.F.C. would continue to loan money to producers outside the group scheme.

The British Film Production fund was initiated during 1950, and resulted from a levy paid by exhibitors; this levy from Aug. 1951, was ¼d. on all seats sold at a price between 4d. and 1s., and ¾d. on seats sold at over 1s. It was estimated that the money raised by these means would amount to some £3 million a year, and producers of British quota films exhibited would receive payments from it in direct proportion to the box-office earnings of their productions, the rate being about 40% of the gross takings. These payments would, it was hoped, close the previously widening gap between production costs and the payments made to producers from box-office receipts. It was also decided that 5% (about £150,000) of the fund should be set aside to finance the production of special children's films, and the Children's Film foundation was set up as a non-profit-making organization under the chairmanship of J. Arthur Rank, with Mary Field in charge of production.

Meanwhile, attendances at British cinemas continued to decline gradually. In the peak year, 1946, the average number of seats sold each week was 32 million; attendances in 1951 averaged 26 million a week, and entertainments duty amounted to 35% of the cinemas' gross total takings. Exhibitors continued to fear the effects of the spreading television habit in British homes, and this was reflected in the many unresolved problems in the relations between the film industry and the British Broadcasting corporation. Certain exhibition interests would have welcomed the chance to use large-screen television in their cinemas, but this would have required a special licence from the postmaster general and so far no licence to transmit television programmes to the public had been granted except to the B.B.C. itself. The industry expressed resentment at the statement in the government's white paper, which followed the report of the Beveridge committee, that, should a licence to transmit

special programmes be granted to exhibitors, the B.B.C. should automatically have the right to transmit any or all of these programmes through its own television service. At the end of the year the industry was waiting with interest a statement of policy from the new Conservative government.

Many outstanding feature and documentary films were produced during the year. These included *The Browning Version*, *Cry the Beloved Country*, *High Treason*, *Encore* (the third in the series of Somerset Maugham short-story films), *The Magic Box* (produced by the industry as a whole as its feature contribution to the Festival of Britain), *The Lavender Hill Mob*, *The Man in the White Suit*, *Murder in the Cathedral*, *No Resting Place*, *Secret People*, *Tales of Hoffmann*, *Pool of London*, *Where No Vultures Fly*, *Never Take No for an Answer* and *Outcast of the Islands*. At the Venice film festival British documentaries received collectively a special additional award for the most outstanding national entry.

The organization of the film side of the Festival of Britain was placed in the hands of the British Film Institute, which was responsible not only for overseeing the production of a number of special documentary films, but also for supervision of the Telecinema at the South Bank exhibition, London, at which stereoscopic films with stereophonic sound were shown.

Commonwealth. Film production in the Commonwealth (except in India which continued its large production of feature films for the home market) continued to be mainly documentary, India, Canada, Australia and New Zealand being the principal producing countries. India had previously formed a films division in its Ministry of Information and Broadcasting, and documentaries were made on many subjects, including architecture, agriculture, industry and health. A series of regional films was also being made, so that life in various parts of the country could be understood throughout India as well as abroad.

Czechoslovakia. Production in Czechoslovakia during 1951 was undertaken under the influence of a resolution passed in 1950 by the central committee of the Communist party. This was worded as follows: "Following the example of the great Soviet film, the Czechoslovak film must play an important part in the education of the new citizen of the Czechoslovak republic, conscious of his mission, a selfless builder of socialism, deeply loving his country and ready to protect it at any time against attacks of its enemies—citizens united with the nations of the U.S.S.R., the people's democracies, and the progressive forces in the entire world by indestructible ties of friendship and love."

The chief films produced were: *New Warriors will Arise* (directed by Jiří Weiss), a study of the origins of the national proletarian movement in the 19th century; *The Basket Bells* (directed by J. Jorčicka), also a historical study of the workers' movement; *Herald of the Dawn* (directed by V. Krska), a biographical film about Božek, the Czech inventor of the steam-car; *It Happened in May* (directed by Martin Fric), a comedy of a factory worker whose prejudices against becoming a "shock-worker" are overcome; *Girl at the Wheel* (directed by Jiří Sequens), the development of a village to Communist forms of production; and *The Fight will End Tomorrow* (directed by M. Cikán), a Slovak story of the workers' struggle in the 1930s.

France. French feature film production, like that of Great Britain, suffered setbacks after World War II, but its output in 1950 was 112 feature films. In 1948 the Paris Film Accord limited the entry of United States films to France, and made it obligatory for French cinemas to show French films for 5 weeks out of each period of 13 weeks. A national film fund was also created from the receipts of a heavy tax imposed on every film, French or foreign, that was distributed, and also from a small entertainments tax

Five British films of 1951: (1) the Royal Command film "Where No Vultures Fly," with Bob Payton (Anthony Steel) and Gwil Davies (Meredith Edwards). (2) "The Lavender Hill Mob," with Holland (Alec Guinness) and Prendlebury (Stanley Holloway). (3) "The Browning Version," with Frank Hunter (Nigel Patrick), Taplow (Brian Smith) and Andrew Crocker-Harris (Michael Redgrave). (4) The Festival film "The Magic Box" with Robert Donat as Willie Friese-Greene. (5) "Tales of Hoffman" with the doll Olympia (Moirá Shearer) and Spalanzani (Leonide Massine).

on cinema seats. French producers, however, who undertook the further production of films received a grant-in-aid from this fund which amounted to a complete refund of the tax on any previous film to their credit in proportion to its box-office receipts (this should be compared with the Eady plan in Great Britain). Even with this substantial assistance, it remained difficult for the many independent producers who made up the French film industry to raise the full capital necessary to undertake fresh production. The French domestic market, working on a single-feature programme basis, could only absorb 70 to 100 films a year after the annual foreign importations of about 185 films—a proportion very bitterly resented by French film-makers—had been allowed for. A further problem was that the French, like the British exhibitors, in general favoured the showing of American rather than native productions because the former on the whole produced higher profits; the rentals for French films, like those for British productions, were higher in the home market, from which they had to recoup the major part of their costs.

Documentary films were normally produced as private commercial ventures, and then as far as possible placed with distributors for exhibition so that they might earn the 3% of the programme receipts which were due to them by law. The abuse of this system (and those who take the documentary seriously in France were doing what they could to stop the abuse) was that producers of feature films themselves manufactured cheaply made short films in order that they might retain the 3% of the proceeds due to the documentary in the programme in which their feature was shown. Responsible documentary producers were sometimes forced to turn to the state for help, since the production of a short documentary never cost less than about Fr. 2 million (about £2,000). It was possible to get minor aid for documentary production through the grant-in-aid scheme referred to above, but producers of short films of a kind likely to interest one or other of the government departments controlling grants for public information work, such as the Ministry of Foreign Affairs, could also obtain help from these sources. Also the film service of the French Cultural Relations department had directly sponsored productions; in this way film studies of the writers Colette, André Gide and Paul Claudel were undertaken.

Among the chief French feature films of 1951 were *Les Amants de Brasmort* (directed by Marcello Pagliero), *L'Auberge Rouge* (Claude Autant-Lara), *Barbe-Bleue* and

A scene from the Swedish film "Miss Julie" which was shown in London in 1951.

Souvenirs Perdus (Christian Jaque), *Edouard et Caroline* (Jacques Becker), *Le Garçon Sauvage* (Jean Delannoy), *Juliette ou la Clef des Songes* (Marcel Carné), *Maîtres après Dieu* (Louis Daquin), *La Nuit est mon Royaume* (Georges Lacombe), *Olivia* (Jacqueline Audry), *Le Plaisir* (Max Louchès), *Sous le Ciel de Paris* (Julien Duvivier) and *Journal d'un Curé de Campagne* (Robert Bresson).

Western Germany. The standard of postwar film production in Western Germany was not high. The great majority of film producers tried to obtain quick success, since the greatest problem for German producers, as for those in other countries, was to draw a sufficient proportion from the box-office receipts to recover their costs. In 1951 there was no shortage of producers (there were about 130 registered companies), but few made more than an occasional single film. A production which attracted attention during the year was a political melodrama, *Der Verlorene*, to write and direct which Peter Lorre, a well-known actor in U.S. films, returned to Germany.

Italy. Italian motion picture production increased from 48 films in 1945 to 68 in 1949 and 100 in 1950; audiences increased by 50% between 1945 and 1950. Production costs on the whole continued to be recoverable from the home market, but the best Italian films were widely exported and had firmly established the reputation of the chief Italian film-makers throughout the world. Documentary productions, as in France, received 3% of the receipts of the film programmes to which they were assigned; there was therefore regular production of documentary films, many of them of a high artistic standard. Italy also had an arrangement of awarding feature films of merit a degree of tax remission. A panel, with film critics prominent upon it, graded new films in terms of quality; the top grade received an 18% remission of entertainments tax and the second grade a 10% remission. Films in the third grade received neither tax exemption nor the right to qualify as quota films in Italian cinemas.

The chief Italian productions of the year were *Miracolo a Milano* and *Umberto D* (directed by Vittorio de Sica), *Il Cristo Proibito* (the first film to be directed by the novelist Curzio Malaparte), *Anna and Luci del Varietà* (Alberto Lattuada), *Napoli Milionaria* (Eduardo de Filippo), *Paris est toujours Paris* (made by Luciano Emmer in France), *The Medium* (Gian-Carlo Menotti's film version of his famous opera), *Cronaca di un Amore* (Michelangelo Antonioni) and *Due Soldi di Speranza* (Renato Castellani).

U.S.S.R. Among films released and planned were: *Admiral Ushakov* (directed by M. Romm); *Admiral Suvorov* (directed by V. Petrov); *The Conscience of the World* (directed by A. Room), a film on the dilemma of a scientist; *Farewell America* (directed by A. Dovzhenko); *The Glory of the People* (directed by G. Alexandrov), a biography of the composer M. I. Glinka; *Green Ocean* (directed by Mark Donskoy); *Harvest* (directed by V. I. Pudovkin), a film on a backward collective farm; *Sadko* (director, V. Ptushko), a film of Nikolay Rimsky-Korsakov's opera; and two biographical films, *Rimsky-Korsakov* (directed by G. Roshal) and *Pushkin* (directed by S. Gherasimov).

Yugoslavia. In the period 1945-48 Soviet films were the dominating element in the Yugoslav cinemas, but during that period it was decided that national film production should be developed. Although it was intended that the six constituent republics of Yugoslavia should develop independent film production, only Slovenia, Serbia and Croatia had in fact begun work to any extent. Slovenia, with its centre of Ljubljana, by the end of 1951 had produced three films; Serbia, with its centre in the national capital Belgrade, had made ten; and Croatia, with its centre at Zagreb, four.

Two United States films: "Born Yesterday" (left) with Billie Dawn (Judy Holliday) and Paul Verral (William Holden); "All About Eve" with (left to right) Eve Harrington (Anne Baxter), Margo Channing (Bette Davis), Miss Casswell (Marilyn Monroe) and Addison De Witt (George Sanders).

The standard achieved in Yugoslavia was remarkable considering that there had previously been virtually no film production. At Belgrade a so-called "film city" was in process of construction just outside the town; it was begun in 1947 and its plans were based on studies undertaken by Yugoslav architects in Czechoslovakia and Germany. The studios were in use in 1951, and the whole undertaking was expected to be completed by 1953. These studios would give Yugoslavia a film production centre which would be among the most outstanding in Europe. The studios in Zagreb were makeshift adaptations of buildings not designed for the purpose. The country as a whole had about 1,000 cinemas seating from 300 to 1,000 people; it was planned to increase the number of cinemas so that there would be one for every 10,000 people, and to serve the villages with mobile cinemas. British films were shown prominently, as also were U.S., French, Italian and German films.

Among the more successful Yugoslav films were: *Fra Brne* (directed by Fedor Hanžeković), a story about the corruption of monks and the monastic system in 19th-century Dalmatia; *The Magic Sword* (directed by Rade Marković), a legendary story; *The Last Day* (directed by Vladimir Pogačić), a melodrama about sabotage; and *The Red Flower* (directed by Gustav Gavrin), a story of a clash between Yugoslav "Quislings" and partisans in a German prison camp during World War II. (R. MAN.)

United States. The U.S. motion-picture industry in 1951 not only halted but reversed the unfavourable business trends which had beset it since 1947. This was by far the industry's most significant achievement of the year, since it indicated that the business had confounded its prophets of doom and had survived what was possibly the gravest crisis in its history. Estimates of the degree of box-office improvement varied from 4.1% to as high as 20% in certain areas.

Many factors entered into the recovery, in addition to better pictures which resulted in greater attendance. They included adjustment to television's worst competitive effects; a larger number of films in colour, always a box-office stimulant; an increase in the number of theatres, particularly drive-ins; improvement in foreign revenues; cuts in production costs; the excellent position in regard to excess profits tax; the good effects of the autumn promotion campaign entitled "Movietime, U.S.A."; and greater co-ordination of various industry elements in matters affecting their common welfare under the auspices of the Council of Motion Picture Organi-

zations (C.O.M.P.O.). Paul Raibourn, vice president of Paramount Pictures and one of the industry's leading economic authorities, estimated that the business volume of the industry in 1951 was from 6% to 8% greater than in 1950. A 10% decline at the beginning of the year, he stated, was offset by later business volume which exceeded the preceding year by as much as 20%.

One of the most significant indications of the change in the industry's outlook was 20th Century-Fox's full restoration of cuts in the salaries of 130 top executives which had been made as an economy measure in 1950. The restoration was based on the company's earnings during the final six months of 1951. Unspectacular but steady gains in weekly attendance also reflected the recovery. From a weekly U.S. attendance of about 53 million, the figures climbed to about 55 million to 60 million weekly.

The trade magazine *Variety* estimated that the total business of the 131 pictures with the highest receipts was \$221,175,000 in the U.S. and Canada, as compared with \$210,565,000 for the pictures with the highest box-office receipts in 1950.

The foreign market for U.S. films expanded during 1951, as the total of film theatres in the world rose to 99,617, an increase of 8,000 over the preceding two years. Progress in easing currency and quota restrictions, as well as better pictures, also were important factors; dollar remittances from abroad for 1951 were estimated at between \$120 million and \$125 million as compared with previous figures of about \$100 million annually. The total estimated gross of U.S. pictures abroad amounted to \$900.5 million in 1950, and 1951 figures indicated the 1950 gross would be exceeded by \$50 million to \$75 million.

Showings of foreign films in the U.S. increased during the year; the number of foreign films approved by the Production Code administration in 1951 rose by 13 over 1950.

The popularity of religious subjects set against spectacular backgrounds, revived by Cecil B. de Mille's *Samson and Delilah* in 1950, reached a peak in 1951 with *David and Bathsheba*, the film with the greatest box office receipts of the year, and the release, toward the year's end, of Metro-Goldwyn-Mayer's *Quo Vadis*. Colourful musicals, numerous comedies, a wide range of war stories, several excursions into the classics, a number of biographies, fantasies, adventure epics, science-fiction features and films on political, racial and social themes—such as *I Was a Communist for the FBI*,

Storm Warning, *The Well and Sound of Fury*—rounded out the extensive assortment. Many of these, such as *The Red Badge of Courage*, also had historical backgrounds. Large-scale westerns were not so prominent among box-office leaders as in previous years, and films with crime, gangster, psychological and horror themes continued to decline.

U.S. exhibitors, by confidential ballots cast in the annual poll of the *Motion Picture Herald*, chose the following as the ten top box-office stars for 1951: John Wayne, Dean Martin and Jerry Lewis, Betty Grable, Bud Abbott and Lou Costello, Bing Crosby, Bob Hope, Randolph Scott, Gary Cooper, Doris Day and Spencer Tracy. The New York Film Critics, in Dec. 1951, announced the following choices: best English-language motion picture of the year, Warner Bros. Pictures' *A Streetcar Named Desire*; best foreign-language picture, *Miracle in Milan*; best actress, Vivien Leigh in *A Streetcar Named Desire*; best actor, Arthur Kennedy in *Bright Victory*; best director, Elia Kazan for *A Streetcar Named Desire*.

The Academy of Motion Picture Arts and Sciences announced in March 1951 the awards for 1950 among which were the following: best picture, *All About Eve* (20th Century-Fox); best actor, José Ferrer in *Cyrano de Bergerac*; actress, Judy Holliday in *Born Yesterday*; supporting actor, George Sanders in *All About Eve*; supporting actress, Josephine Hull in *Harvey*; best direction, Joseph L. Mankiewicz for *All About Eve* (20th Century-Fox); best documentaries, short subjects, *Why Korea?* (20th Century-Fox Movietone); producer, Edmund Reek; feature, *The Titan: Story of Michelangelo* (Michelangelo company, Classics Pictures); producer, Robert Snyder; foreign-language film award, *The Walls of Malapaca*. Among special awards was one to Louis B. Mayer for his pioneering leadership. (A. AR.)

Educational Motion Pictures. Encyclopædia Britannica Films led 1951 production with films presenting biographical sketches of great Americans. These included: *Thomas Jefferson*, *Benjamin Franklin* and *Booker T. Washington*. Young America Films made a contribution to the study and practice of human relationships with such films as *The Other Fellow's Feelings* and *The Outsider*. McGraw Hill Text-films continued to produce films for use in training teachers. Film production budgets for 1951 were in general increased, mostly because of increases in local school film purchases. The greatest increase in film purchasers was by newly created school film libraries.

While the school use of educational films climbed to its highest peak in the history of U.S. education, several national organizations continued to sponsor programmes of acquainting the adult population of the United States with the power of the educational film. The Educational Film Library association served more than 600 members with information. The Film Council of America was considerably reorganized, and it refinanced the service activities to which it was committed through a substantial grant-in-aid from the Ford foundation. It supplied information about the selection and use of 16-mm. sound motion-picture films. (W. A. WH.)

Technical Developments. *Theatre Television.* Theatre television became a commercial reality in 1951, with the first exclusive theatre telecast of a major sports event being shown in nine theatres in six U.S. cities to capacity audiences. About 50 installations were made of direct projection theatre television systems, and there were several theatre systems in use that photographed a small-sized television receiver tube with either 16- or 35-mm. reversal film. This film was processed in 30 to 40 sec. and then projected normally.

New Technicolour System. Technicolour introduced a new colour system balanced for 3,350 K tungsten illumination with an ASA exposure speed of approximately 50, whereas the original three-colour system was balanced to 5,700 K daylight

illumination with an exposure speed of approximately 18. The new system was readily accepted and several feature pictures were made and released using the system. The increased speed and the fact that it allowed the use of incandescent rather than arc lamps resulted in substantial economies in set lighting.

Negative-Positive Colour System. Ansco and the Eastman Kodak company both introduced new negative-positive colour films which were daylight balanced, with an ASA exposure speed of approximately 18. A negative-positive system is one in which two multilayer-type colour films are provided, one for camera use and the other for preparation of release prints. Both films are intended for processing by the user. The camera film, or negative, is exposed in conventional motion-picture cameras. The positive material may be printed on modified conventional printers. Processing is carried out in continuous-type developing machines similar to those used for conventional black-and-white film processing, but with more tanks to allow for the increased number of steps required.

Strippable Negative Colour System. The Eastman Kodak company also made available on an experimental basis a multilayer stripping negative for colour, said to have an ASA speed rating of 64 (tungsten). This negative consists of a single film base bearing three black-and-white emulsions. The layer next to the base is red sensitive, the next is green sensitive and the top emulsion is blue sensitive. Between the red- and green-sensitive layers is a special interlayer which has the property of adhering to the emulsions when dry but readily separating when wet. A similar interlayer is between the green- and blue-sensitive emulsions. As the green- and red-sensitive emulsions are also sensitive to blue light, a yellow filter layer is interposed between the blue and green emulsions. After exposure, but before development, the two upper layers are wet stripped separately and each transferred to its own film base. This strippable negative can be exposed in regular studio cameras and it also provides separation or three-strip negatives which can be developed in standard black-and-white processing equipment. (W. F. KY.)

CIVIL AVIATION: see AVIATION, CIVIL.

CIVIL DEFENCE. The year 1951 showed further consolidation in the process of re-establishing civil defence in the United Kingdom. Recruiting continued throughout the year, reinforced by special campaigns; the number of volunteers exceeded 150,000 and it was hoped that this number would continue substantially to increase. Although the numbers had gone up considerably they were still short of the peacetime requirement.

Local authorities throughout the country were busy getting their organizations set up on the lines of the six sections (five in Scotland). Heads of these sections were appointed and the actual training for section duties began.

A further important step was the issue of the first industrial bulletin outlining the part that industry should play in civil defence and giving guidance generally on its requirement. All business undertakings employing more than 200 people were responsible for providing their own civil defence organization. Those employing less than this number would come in as part of the local authority scheme. A number of the biggest industries had already made considerable strides in setting up their organization and in getting personnel trained. An important difference from World War II was that, with the exception of the nationalized industries and those being run directly by a government department, the supervision of civil defence arrangements would rest with the Home Office instead of being split up between a number of government departments.

A number of local training centres were set up, including rescue training grounds, and many authorities now had a proper civil defence headquarters where not only training but also social functions could be held. The work of the Civil Defence Staff college at Sunningdale park continued, and representatives from a number of countries within the Commonwealth, belonging to the North Atlantic Treaty organization and others outside it, attended courses. The three technical schools were working at full capacity, and in addition to the training of instructors for the United Kingdom had also trained staff for Canada and Malta, where schools were opened in 1951.

The shelter surveys were completed in many areas and further instructions were sent out, though no actual building of shelters was undertaken.

Civil defence was given its allotment from the total amount of money available for defence in the United Kingdom, and certain priority tasks were allotted which were directly related to the strengthening of the fighting services. The earmarking of buildings for civil defence premises was more or less completed. A number of important exercises were held, including in three cases the bringing in of an *ad hoc* military mobile column in support of civil defence.

During the year authority was given for the extension of the Civil Defence Staff college to take up to 70 students, and the addition of a tactical school to be attached to the staff college for a further 50 students. This project entailed the building of additional premises and the foundation stone of the new building was laid by the home secretary on July 28.

The training of local instructors was pushed ahead with vigour and by 1951 the number was in the region of 10,000.

"High Street, Blitzyville" which was constructed in the grounds of Taymouth Castle, Perthshire, to train civil defence rescue teams.

CIVIL LIST PENSIONS. Under the Civil List act, 1937, the amount allowed to be granted as pensions in any one year was £2,500. In the year ended March 31, 1951, £1,150 of this was expended on new pensions, and £1,350 on increases to earlier ones.

Eight new pensions were granted: to Ethel Austin, widow of Frederick Britten Austin, in recognition of his services to literature (£200); to Lily Frances Chitty for her services to archaeology (£150); to Daisy Fowler Drinkwater, widow of John Drinkwater, for his services to literature (£150); to Dorothy Kingsmill Lunn, daughter of Hugh Kingsmill Lunn, for his services to literature (£150); to Catherine Phillips, widow of Walter Alison Phillips, for his services to historical studies (£100); to Lady Elliot Smith, widow of Sir Grafton Elliot Smith, for his services to science (£100); to Rosa Snell, widow of Frederick John Snell, for his services to literature (£200); and to James Lewis Thomas Chalmers Spence for his services to literature (£100).

CIVIL SERVICE. *Structure of Government.* In Jan. and July 1951 two important changes were made in the structure of government. First, certain functions of the Ministry of Health relating to local government were taken from that ministry and combined with those of the Ministry of Town and Country Planning, which was renamed the Ministry of Local Government and Planning. This department thus became responsible for housing and the new towns, services such as water and sewerage, planning and controlling the use of land, and the general oversight of local government and its finance; the Ministry of Health (new style) remained responsible for the health services only. Secondly, the Ministry of Materials was created by the transfer of certain responsibilities from the Board of Trade and the Ministry of Supply. The purpose was to centralize the responsibility for the production and procurement of the bulk of raw materials in a department which could give its whole time to these matters.

When Winston Churchill formed his government after the general election of Oct. 1951, the following further changes were made. Two members of the cabinet were appointed with special co-ordinating responsibilities. The lord president of the council was given general oversight over the activities of the Ministry of Food and the agriculture departments, and a new post was created of secretary of state for the co-ordination of fuel and power and transport, concerned with issues of policy affecting this group of industries and services. A minister of state was appointed to assist the secretary of state for Scotland. The home secretary became the member of the cabinet with special responsibility for Wales, and was to be given a second parliamentary under secretary, whose task was to concentrate on Welsh affairs. The paymaster general was given special responsibility for the supervision of atomic energy research and production. The title of the Ministry of Local Government and Planning was changed to Ministry of Housing and Local Government. One minister was appointed to take charge of both the Ministry of Transport and the Ministry of Civil Aviation.

Strength. No great change took place in the size of the civil service during the year. The expansion of the service and supply departments to carry out the defence programme, and the extra work of rating valuation which fell to the inland revenue department under the Local Government act, 1948, involved increases which more than counter-balanced reductions elsewhere. As the result, the total non-industrial staff of the civil service rose from 675,400 in Oct. 1950 to 685,447 in Oct. 1951.

Recruitment. No important changes were made in the system of recruitment. For the first time a special competition

was held to provide a method of entry to the clerical class for young men after completing their period of compulsory national service.

Professional Classes. Reports were received during the year from two important committees; the first, under the chairmanship of Sir Thomas Gardiner, reviewed the pay and organization of engineers, architects, surveyors and allied professions in the civil service; the second, under the chairmanship of Sir Harold Howitt, considered the pay and organization of medical officers. Both reports recommended some increases in salaries, particularly in the junior grades, in order to bring the rates more into line with those received outside the civil service. (E. E. Bs.)

CLASSICAL STUDIES. The most notable event in 1951 was the fourth triennial joint meeting of the Hellenic and Roman societies, the Classical association and the British schools at Athens and at Rome, which was held at Cambridge during eight days in August. There was a large attendance, which included many scholars from overseas, and the variety of the papers read illustrated the wide sweep of classical interests. Earlier in the year the Classical association held its annual four-day meeting at Liverpool, at which the presidential address was delivered by Harold Nicolson on "Nature in Greek Poetry." There was also a meeting in London on the general theme of Greek and Roman epic poetry. The Virgil society and the Association for the Reform of Latin Teaching also arranged successful conferences. The Orbilian society produced three numbers of *Acta Diurna*, its lively Latin newspaper for schools, as well as a useful catalogue of visual aids for classical teachers. Inter-school prize competitions in the reading of Latin and Greek aloud were again organized by many local branches of the Classical association.

Among books and papers published since the last months of 1950 the most startling was E. Lobel's *A Greek Historical Drama* (London, 1950), which set out the 16 decipherable lines of a papyrus fragment of what was, apparently, a hitherto unknown type of Greek tragedy. D. L. Page, in his inaugural lecture as regius professor of Greek at Cambridge, discussed this fragment further and, with great learning, upheld the early date assigned by Lobel. This lecture was published as *A New Chapter in the History of Greek Tragedy* (Cambridge, 1951). A contrast to these slim pamphlets was the massive work of E. H. L. Lorimer, *Homer and the Monuments* (London). Other important books were D. L. Page, *Alcman: Parthenion* (Oxford), and M. Platnauer, *Latin Elegiac Verse* (Cambridge).

There was a number of welcome re-issues in 1951 of older books, notably R. Meiggs's revision of J. B. Bury's *History of Greece* (London), J. F. Mountford's revision of Sidgwick's *Greek Prose Composition* (London), R. Meiggs's and A. Andrewes' revision of Hill's *Sources of Greek History* (London), G. B. Grundy's *Thucydides and the History of his Age* (Oxford), V. Ehrenburg's *The People of Aristophanes* (Oxford) and F. G. Kenyon's *Books and Readers in Greece and Rome* (Oxford). Important continuations were vol. v of E. A. Lowe's *Codices Latini Antiquiores* (Oxford), vol. iii of Meritt, Wade-Gery and McGregor's *The Athenian Tribute Lists* (Princeton) and, in the Loeb series (London), the sixth of the ten volumes of Pliny's *Natural History*, edited by W. H. S. Jones. To the popular Penguin books (London) were added S. A. Handford's *Caesar's Conquest of Gaul*, R. E. Latham's *Lucretius*, P. N. Ure's *Justinian and his Age* and T. B. L. Webster's *Greek Terracottas*.

Classical scholarship suffered a sad loss during 1951 by the deaths of Miss M. Alford, R. G. Bury, H. E. Butler, R. M. Henry, Miss K. Jex-Blake, Miss N. Jolliffe, J. G. Milne, G. C. Richards and Miss C. Skeel. (L. J. D. R.)

CLOTHING INDUSTRY. Considerable and continuing fluctuation in the prices of raw materials, particularly wool, made the making and selling of clothing a precarious business during 1951. The year opened with a "beat-the-price" buying rush by the public, in the expectation of rising prices as garments made from the current raw material purchases reached the market. When wool prices suddenly fell in April the previously higher prices had by then begun to be reflected in clothing prices, and the demand from the public eased off.

Having reached a record peak in March, which was 11 times higher than the price ruling in June 1939, the wool market, in May, suffered the most severe fall in its history, and afterwards continued to fluctuate. In consequence, clothing manufacturers were, for the second time in the year, faced with the position of having to offer identical garments at different prices, based on the cost of the raw materials. With consumer-buying at a very low ebb, retailers had large sums tied up in stocks bought at the higher level, and they were not all keen to buy further supplies, pointing out that they could not sell the more costly goods side by side with cheaper counterparts. The position was thought by some to be aggravated by speeches by Hugh Dalton, minister of local government and planning, in September, urging the public not to buy clothing until prices were reduced. Rises in unemployment figures in some clothing manufacturing centres followed soon afterwards.

Towards the end of the year, the prices of some items of clothing began to drop. Unemployment and short-time working in the garment centres was on the increase in November, but the outlook was generally more optimistic.

During the year, purchase tax continued to cause concern to the clothing industry, because of the gap it produced between the prices of utility and non-utility goods. A government-sponsored committee was set up to deal with this problem and trade associations in various sections of the industry were invited to submit recommendations. Suggestions varied from the complete abolition of the tax to the introduction of a general sales tax in its place. The majority of opinion, however, appeared to favour a general reduction in the rates of tax as a first step. The committee's report was expected early in 1952.

The Clothing Industry Development council, set up by the Labour government, despite opposition from the employers, opened headquarters in London and branches in Leeds and Manchester during the year. Apart from paying the compulsory levy, the majority of the bigger firms in the industry continued to withhold their support from the organization. Following the defeat of the Labour government in October it was expected that the whole question of the Development council would be the subject of a review by the new government.

In August, the government announced its intention to reintroduce the cost-plus system in the clothing trade, to supplement control by maximum prices. Clothing manufacturers opposed this move, which would have meant their having two sets of prices, and the general election was announced before any further action was taken.

For the ten months to Oct. 31, the value of exports of clothing from the United Kingdom amounted to £39,414,925, as compared with £28,554,005 in the corresponding period in 1950, and £24,337,253 in 1949. The value of clothing shipped to the United States during the period rose to £3,774,720, as compared with £2,628,533 in 1950. Australian purchases, which dropped from £4,043,138 in 1949 to £2,973,085 in 1950, jumped to £5,006,000; the figure for Sweden was £4,002,990, as against £2,469,270. Exports to Canada were valued at £2,855,252 (£2,475,732); Republic of Ireland £1,912,603 (£1,916,468); the Netherlands

£1,157,216 (£915,925); Belgium £1,298,657 (£950,414); Switzerland £1,116,236 (£630,324); and Germany £760,424 (£823,030). (R. J. My.)

United States. The year 1951 was one of slump in the clothing industry. Consumer resistance to high prices, particularly in men's wear, caused unit sales to drop with a consequent fall in production at factory levels. Many factories operated only part time, especially in the work clothing field.

Price controls held textile costs in hand but minor wage increases were granted. The world-wide wool shortage was reflected in the high price of woollens and worsteds and there was a shortage of tropicals. Synthetics took an increasing share of the market; new fibres such as orlon and dacron entered the men's suitings field on a strongly competitive price basis.

Despite reluctance on the part of clothing manufacturers to expand, several large highly efficient factories were opened during the year. Machinery sales fell drastically throughout the entire world. Nevertheless machinery research continued on new models. These included a new powerful, fast self-sharpening cutting machine; automatically lubricated special sewing machines for a variety of purposes on work, dress and woollen clothing; a new button sewing machine of British make; and a number of new air-operated pressing and creasing machines. Changes appeared in U.S. military garments. Following research, a sponge type undergarment was in the final stages of perfection. New developments, stressing dead air space, were used in cold climate garments. Pressure flying suits for high altitudes were used.

The industry became exceedingly price-conscious because of the high cost of labour and materials and high taxes. Manufacturers attempted to cut costs, but often found it difficult to maintain quality. Such minor items as the substitution of pressed-on heat-sealed labels in lieu of sewed-on labels showed the trend. (See also TEXTILE INDUSTRY.)

(S. L. S.)

COAL. The coal mining industry in Great Britain was nationalized in 1947 and had completed its first five years under state ownership by the end of 1951. However much one section of the nation objected in principle to the idea of nationalization of industry, all were agreed that in the case of coal it was inevitable. During the 20 years between World War I and World War II, there was little or no co-operation between the opposing camps, coal owners and mineworkers. The general state of the coal industry declined until, during World War II, it became necessary for the government to introduce various forms of control, such as the Coal Charges act. The annual output steadily declined from 259 million tons in 1924 to 182 million tons in 1946. After that it began to rise, but not fast enough to meet the growth in demand. Consequently, coal crises developed with unpleasant regularity in the winter months. The production of deep-mined coal in 1950 was 204·1 million tons and of open-cast coal 12·2 million tons, making a total of 216·3 million tons. For 1951 the totals were: deep-mined coal 211·1 million tons and open-cast 10·99 million tons, a total of 222·1 million tons. This exceeded the highest estimate (222 million tons) made in the government's *Economic Survey* for the year.

TABLE I. LABOUR PRODUCTIVITY IN COAL MINES IN GREAT BRITAIN

	1949	1950	1951*
Face workers (total)	296,000	288,000	287,000
All workers (total)	719,000	697,000	698,000
Shifts worked (average per week)	4·67	4·7	4·7
Output (tons) per man shift at face	3·02	3·11	3·16
Output (tons) per man shift at face (overall)	1·16	1·19	1·21

* Estimated.

ANNUAL COAL PRODUCTION IN THE CHIEF EUROPEAN PRODUCING COUNTRIES

The National Coal Board. The control of the industry was vested in the National Coal board, comprising seven permanent members with power to co-opt part-time members. The appointment of the board members was for five years. During 1951, at the expiration of his five years' appointment, the chairman, Viscount Hyndley, resigned and was succeeded by Sir Hubert Houldsworth, previously chairman of the East Midlands Divisional board.

In addition, Sir Lionel Lowe and Sir Eric Young retired and W. J. Drummond, Sir Eric Coates and Sir Andrew Bryan were appointed. The board suffered a great loss during the year when its vice chairman, Sir Arthur Street, died. W. J. Drummond and Sir Eric Coates became joint vice chairmen.

TABLE II. WAGE EARNERS IN MINING IN GREAT BRITAIN, SHOWING ABSENTEEISM RATE, RECRUITMENT AND WASTAGE

Year	Total Employed	Absenteeism		Recruitment	Wastage
		Face Workers %	All Workers %		
1945	708,905	19·12	16·31	48,668	66,019
1950	697,000	14·51	11·96	50,281	75,803
1951 (est.)	698,000	—	—	60,000	58,000

There were also five part-time members. Originally, the duties of the full-time members of the board were functional, but with new appointments this responsibility began to lapse and they became more concerned with policy than execution.

The National Coal board was, on several occasions during 1951, subjected to severe criticism by ex-members and by prominent ex-coliery proprietors. The chief complaint was that the board itself, with its headquarters staff, retained too tight a control on operations in the divisions and tended to stifle initiative. Other comments were that the powers of the colliery manager were being undermined by the creation of too many advisers at all levels. It is fair to say that the board itself repeatedly stated that the mine manager was the kingpin of the whole organization.

Mining is a mechanized industry and it is doubtful whether it is possible for one man, *i.e.*, the manager of a mine, to keep abreast of all the technical developments. In other words, whereas the vertical chain of control: manager, agent, managing director, of pre-nationalization days had to be retained, there had to be lateral developments at different levels—specialization and service departments—whose duties were to advise the mine manager. The actual day-to-day running of a large mine is a full-time job for any man. Under the National Coal board, the manager had ventilation engineers, dust suppression engineers and safety engineers, specialists in their own line, to advise him. This was not new because earlier managers had engine-wrights, electricians, surveyors, etc., on their staff. The difference was that these

additional officials had been up-graded in status and had developed a higher standard of knowledge. Nevertheless, the manager still had legally the last word about the working of his mine.

Pensions. A pension scheme was agreed between the mine-workers and the National Coal board. The scheme was a joint contributory one and the benefits were in addition to any received under the National Old Age Pension scheme. The amount of benefit was determined by an accumulation of "units," which were earned by length of service and regularity of work. The maximum benefit was 30s. per week on retirement at 65. The National Coal board contributed 1s. 8d. and each workman 1s. 3d. a week worked. A donation of £2 million was placed in the fund to start it off and this had to be followed by further yearly donations until the scheme became actuarially solvent.

TABLE III. MONTHLY RATE OF DELIVERY OF MACHINERY TO COAL MINES IN GREAT BRITAIN

	1949	1950	1951
Coal cutters	64	48	44
Power loaders	8	5	5
Conveyors	245	200	200
Underground locomotives	6	4	4

New Development. During the year, the "Plan for Coal" was pursued but, because of shortage of materials, the tempo was slower than was intended.

Several large new ventures were started during the year, of which the following are examples. A new colliery designed to raise 1 million tons a year from seams lying under the Firth of Forth was started. It would replace the Kinneil

* Estimate.

colliery which, for many years, had worked the shallower portions of the seams. Approval was given to spend £7,500,000 on a new anthracite colliery near Swansea. It was expected that 1 million tons of high grade anthracite would be raised from a depth of about 2,000 ft. and that reserves would be available to last 100 years. It was believed that much of this coal would be exported to the United States and Canada. One large coking and by-products plant came into operation during the year and orders were placed for another, costing £8 million, to carbonize 750,000 tons a year near Chesterfield. It was intended that this plant should incorporate all the most recent European and U.S. innovations. When completed it was expected to be the most up-to-date coking and by-products plant in the world.

Price Structure. An entirely new price structure for house coals was introduced in June 1951. All house coals were classified, according to quality, into eight national groups with substantial price differentials between each group. Great Britain was divided into 60 consuming areas or zones. The prices in each zone were to include the average overall cost of transporting coal to that zone. The price of similar

A coal cutter, tilted to cut at the bottom of the seam, operating on top of an armoured conveyor. The hydraulic pit-props (on left) allow the conveyor to work in a prop-free track.

coal in each zone would be common within that zone but, owing to transport costs, would differ from zone to zone. For a given price per ton, therefore, a customer could be certain of obtaining a standard type of house coal within his zone.

Prices. Pit head prices moved upwards twice during 1951 and coal was 8s. to 10s. per ton dearer at the pit head than in 1950. Bunker coal was also increased by £1 per ton. These pit head increases were largely due to increased wages and amenities which had not been counter-balanced by increased production or better attendance.

Scientific Investigation. When the National Coal board took control of the mines, the scientific resources available solely for the coal industry needed co-ordination. The British Coal Owners Research association, the Fuel Research board and the Safety in Mines Research board were doing good work but their resources were small relative to the importance of the industry. By 1951 there were research stations scattered throughout the industry with a central station near Cheltenham, Gloucestershire. Within the coalfields themselves the scientific staff were mainly concerned with safety of the mines, quality of the coal and a survey of the coal resources. At the central station, a team of 250 workers, scientists and technicians were working on a variety of problems such as carbonization of coal, dust prevention and estimation, improvement of machines and coal-cleaning problems. In general, the work was divided into three main groups, below ground, technical; above ground, technical; and chemistry/physics, applied to fundamental problems common to the first two.

During 1951, output of deep-mined coal rose slightly and the output per man-shift was improving. On the other hand, great difficulty was being experienced in maintaining the level of manpower (see Table I). Attempts were made to introduce foreign labour, of which there was a fair supply available, but some of the British miners objected to this system of recruitment. Some Poles and a few Italians were absorbed and were proving satisfactory. In 1938 the output per man-year was 299 tons; by 1950 it had fallen to 293 tons. Unless some drastic change took place in the rate of entry into the coal industry, it was going to be very difficult to maintain the output even at this inadequate level. The reasons were, possibly, a general fall in manpower, rise in average age of the miner, shorter working hours and more difficult and thinner seams. Higher wages had not necessarily produced greater effort.

It seemed reasonable to assume that mechanization would increase the output of the individual. Otherwise its introduction would not repay the cost and labour used in making the machine. Recurring fuel crises had occurred in the early months of each year and warnings of a severe crisis in 1952 were given by many highly placed officials. This would seriously affect the export of coal, which was the exchange medium for many commodities so essential to the national

economy. Coal, in fact, was being imported into Great Britain from the U.S., India and Nigeria and the cost was high. (See also EUROPEAN COAL AND STEEL POOL.)

COCKCROFT, SIR JOHN DOUGLAS, British physicist (b. Todmorden, Yorkshire, May 27, 1897), was educated at Todmorden Secondary school, at Manchester university and at St. John's college, Cambridge, of which he was a fellow, 1928-46, and an honorary fellow from 1947. He was Jacksonian professor of natural philosophy in the University of Cambridge, 1939-46. From 1941 to 1944, however, he served as chief superintendent, Air Defence Research and Development establishment, Ministry of Supply, and from 1944 to 1946 was director of the atomic energy division, National Research Council of Canada. In 1946 he became director of the Atomic Energy Research establishment, Ministry of Supply, at Harwell, Berkshire. It was at a meeting of the Royal Society on April 28, 1932, that Lord Rutherford made the dramatic announcement that two of his workers at the Cavendish laboratory, Cambridge—Cockcroft and E. T. S. Walton (*q.v.*)—"had successfully disintegrated the nuclei of lithium and other light elements by protons entirely artificially generated by high electric potentials." On Nov. 15, 1951, the Royal Swedish Academy of Sciences announced the award of the Nobel prize for physics jointly to Cockcroft and Walton for "their pioneer work on the transmutation of atomic nuclei by artificially accelerated atomic particles." Cockcroft had been elected a fellow of the Royal Society in 1936 and had been knighted in 1948.

COCOA. Production in British West Africa was 7.5% greater in 1950-51 than in 1949-50, the Gold Coast crop amounting to 262,000 tons and that of Nigeria to 111,000 tons, as against 248,000 tons and 99,000 tons respectively in 1949-50; for 1951-52 the Gold Coast main crop was forecast at 261,000 tons. Production in both territories, however, still remained a little below the immediate prewar average and swollen-shoot disease continued as the chief problem facing cocoa production. In the Gold Coast, compulsory destruction of diseased trees was replaced by a voluntary scheme in 1951 with increased compensation rates. The use of a new systemic insecticide attacking the mealy-bug which transmitted the swollen-shoot virus was expected to prove a valuable supplement, though not an alternative, to destruction. The prices paid by the Gold Coast Cocoa Marketing board and the Nigeria Cocoa Marketing board were raised to £130 13s. 4d. and £120 a ton respectively for 1950-51, as against £84 and £100 respectively in 1949-50; for 1951-52 further increases to £149 6s. 8d. a ton in the Gold Coast and £170 in Nigeria were announced. Prices of Accra cocoa on the New York market, under the influence of price ceilings, fluctuated between 37.0 cents and 38.4 cents per lb. in the first seven months of 1951, thereafter declining to around 35 cents per lb.; in the previous year monthly average prices had ranged from 22.8 cents to 42.0 cents per lb.

Brazil's crop amounted to about 134,000 tons in 1950-51, and was forecast at 138,000 tons for 1951-52 as compared with the record output of 159,000 tons in 1949-50. French West Africa and Cameroun together in 1950-51 provided a further 100,000 tons.

British West Africa's cocoa exports continued as one of the principal colonial dollar earners. In 1950-51 exports from the Gold Coast reached 252,000 tons and those from Nigeria 109,000 tons, the combined total being 4,000 tons greater than in the previous season. Brazil's exports in the first 8 months of 1950 amounted to 67,000 tons, while those from the Dominican Republic in the year 1951 were 22,000 tons. Imports into the United States, the world's chief consumer, in the first 11 months of 1951, amounted to 254,000 tons as against 294,000 tons in the full year 1950. The United Kingdom took 107,000 and 130,000 tons in 1951 and 1950 respectively; from Nov. 1, 1950, cocoa purchases by the Ministry of Food ceased and price and other controls on raw cocoa (but not cocoa products) were abolished. A representative buying panel was set up by manufacturing companies to negotiate purchases and prices with the Cocoa Marketing boards, while in Jan. 1951 the London Cocoa Terminal market was reopened. (E. O. G.)

COFFEE. World exportable production of coffee in 1950-51, at 33 million cwt., was very slightly under the estimate for 1949-50 and at least 20% below the 1936-40 average. Latin America's output was estimated at 27.5 million cwt., as against 28.5 million cwt. in 1949-50 and a prewar average of some 38 million cwt. The main decline was in Brazil, which produced an average of 26 million cwt. before World War II, but only 16 million cwt. in 1950-51, and Indonesia also produced only a fraction of its prewar output. Expansion of output was, on the other hand, marked in Colombia (nearly 6 million cwt. in 1950-51, as against a prewar average of 5.3 million cwt.) and in Africa (5.1 million cwt. in 1950-51, of which British East Africa provided one-fifth), where production in French West Africa, Angola and Uganda had doubled or even trebled since before World War II. For 1951-52, the world exportable crop was expected to exceed 35 million cwt., both Brazilian and Colombian crops being greater than in the preceding season, and extensive plantings resulting from high postwar prices seemed likely to result in an increase in world production.

Total exports from Latin American countries (principally Brazil) in 1950 amounted to 28.5 million cwt., as against 35 million cwt. in 1949, this marked decline being attributed to the great rise in prices which began late in 1949; in both years over 70% of total exports went to the United States. Imports of coffee into the U.S. from all sources in 1950 totalled 21.8 million cwt. as against 26.1 million cwt. in 1949, the prewar average annual import having been some 16.5 million cwt. Total imports into Europe (including the United Kingdom) in 1950 were 9.6 million cwt., 300,000 cwt. less than in 1949, but about 25% below the immediate prewar average; Europe's receipts of coffee from non-American sources were, however, greater in 1950 than in 1949. Imports into the United Kingdom in 1951 amounted to 852,000 cwt. as against 798,000 cwt. in 1950 and 401,000 cwt. in 1938; the Ministry of Food continued as the sole buyer and British East Africa and Brazil were the chief sources of supply.

World coffee supplies in 1951 still fell short of demand and the invasion of Korea produced a further appreciable rise in prices. By the beginning of 1951 Brazil's Santos No. 4 averaged over 50 cents per lb. on the New York market, but in February a ceiling of 55.5 cents per lb. on this type was imposed; following the modification of price control in May, coffee prices showed a slight decline. COLOMBIA. Republic situated in northwestern South America adjoining the isthmus of Panama, Colombia is the only South American country with both Caribbean and Pacific coast lines. Area: 439,714 sq.mi. Pop. (1950 est.): 11,260,000. About 68% of the population is classified as mixed blood, 20% as white, 7% as Indian and 5% as Negro. Most Colombians live in the highlands and mountain valleys of the interior. Language: Spanish. Religion: predominantly Roman Catholic. The capital is Bogotá (pop., 1947 est., 482,480). Other major cities: Medellín (237,220); Barranquilla (225,430); Cali (147,160); Manizales (117,760); Cartagena (106,820). President, Laureano Gómez Castro.

History. During 1951, bitter strife between the governing Conservative and opposition Liberal parties brought Colombia close to civil war. The state of siege originally proclaimed in Nov. 1949 remained in force and guerrilla clashes between Conservatives and Liberals, occurring primarily in rural areas, persisted. Under the state of siege, constitutional guarantees remained suspended. Censorship of radio news broadcasts was installed in April as an addition to the previously existing press censorship. Congressional elections, originally scheduled for June, were postponed until September. In explaining that action, President Gómez declared that there would be little point in holding an election so long as the Liberal opposition clung to its policy of electoral abstention, and that he hoped the Liberals would abandon that position by September. This did not prove to be the case: when the congressional elections were held on Sept. 16 there were no Liberal candidates, with the result that the party composition of the national legislature became 100% Conservative.

An attempt to achieve reconciliation between the two major parties was launched by the Liberals in early summer, when that party elected Alfonso López Pumarejo, a former president (1934-38, 1942-45), to a two-year term on the Liberal party council. Further steps toward inter-party harmony were taken in August, when moderate members of

both parties met to discuss a project to call a constituent assembly for the purpose of restoring constitutional government. That project failed. In October, however, the Conservative and Liberal parties agreed to attempt to eliminate violence by political "bandit" gangs, and at the end of the year some Colombians saw hope of eventual domestic peace.

The government announced in February that it would send a "hand-picked battalion" of 1,080 officers and men to assist the United Nations forces in Korea. Considerable publicity attended the battalion's preparation for departure, but by the end of the year it had not yet appeared in combat zones. However, a Colombian frigate—the first South American fighting unit to participate in the Korean action—joined the U.N. Task Force 95 in Korean waters in May.

(G. I. B.)

Education. Schools (1947): primary 11,320, pupils 738,716, teachers 17,528; secondary and vocational 1,005, pupils 92,112, teachers 7,480; universities 5, students 8,032, professors and lecturers 1,335. In addition, 1,206 primary, 630 secondary and 2 higher educational institutions did not report enrolments.

Agriculture. Coffee production in 1950 was about 5,000,000 bags (of 132 lb.), of which 4,480,567 bags were exported, including 4,059,763 bags to the U.S. Banana exports were 6,437,834 stems. Production of other crops included: cotton (ginned) 7,750 short tons; rice (milled) 159,000 tons; potatoes 485,000 tons. Sugar production included: centrifugal 161,000 tons and *panela* 520,000 tons. In 1950 there were an estimated 15,200,000 cattle, 2,470,000 pigs, 531,000 goats and (1949) 1,061,000 sheep.

Industry. Mineral production (1950): gold 379,412 troy oz.; platinum 24,452 oz.; silver 116,104 oz.; salt 155,445 short tons; crude petroleum production 34,059,017 bbl. Crude exports were 28,268,872 bbl., of which 15,672,670 bbl. went to the U.S. and 9,297,535 bbl. to Curaçao (for refining). Refinery production throughout was 9,563,587 bbl., and refined products included 2,019,000 bbl. of petrol.

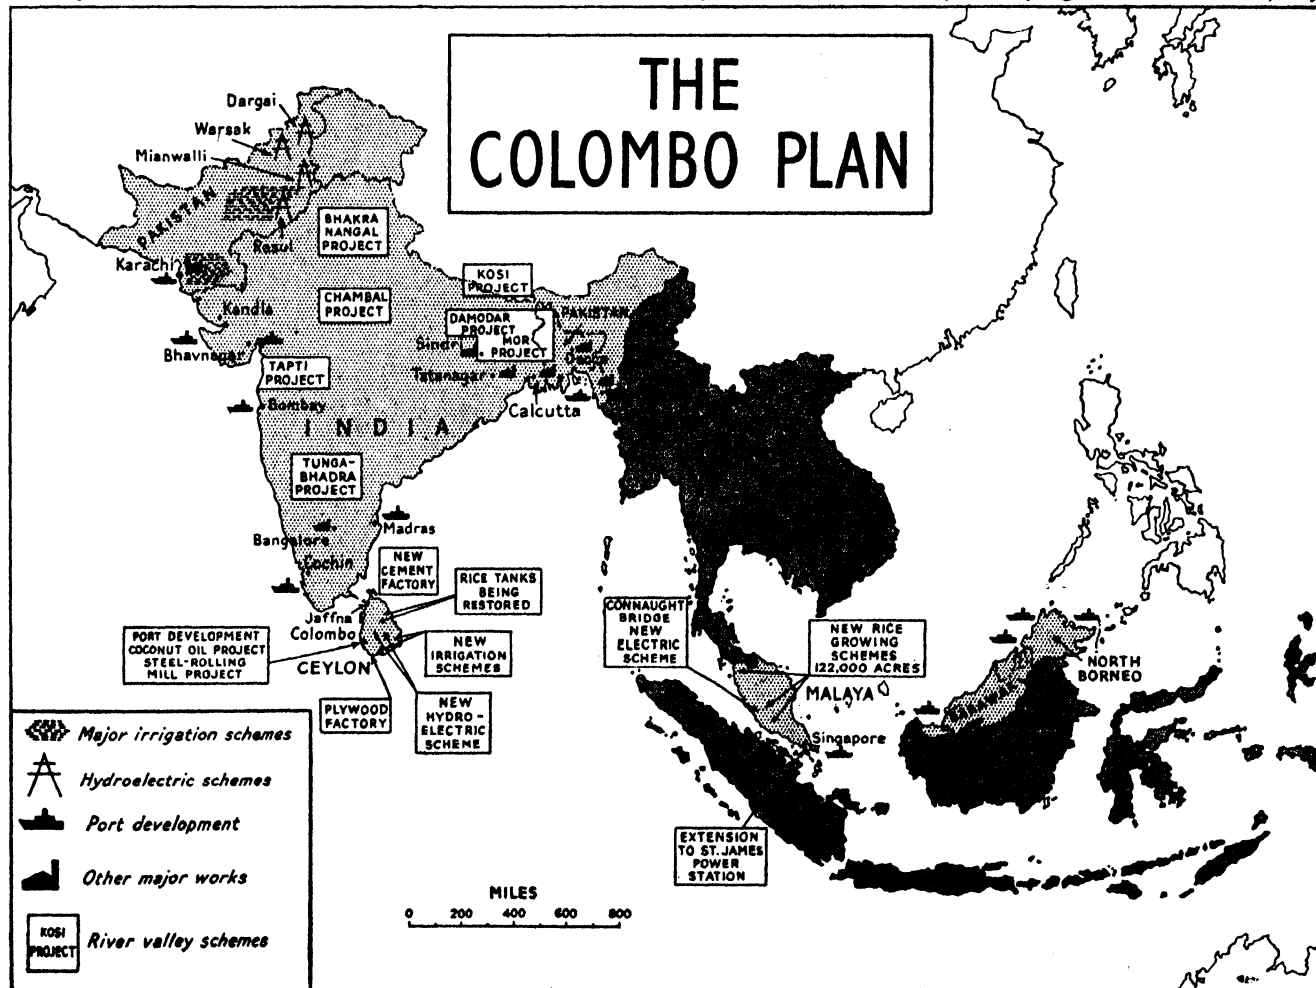

Foreign Trade. Exports in 1950 totalled 767,556,000 pesos, imports 655,853,000 pesos. Leading exports: coffee (78%), petroleum (16%), gold (2%) and bananas (2%). Leading customers: U.S. (83%), the Netherlands Antilles (4%), Germany (4%). Important suppliers: U.S. (68%), U.K. (5%), Germany (5%).

Transport and Communications. Railways (1947): 2,208 mi. Roads, improved (1948): 11,166 mi. Motor vehicles (Dec. 31, 1948): cars 25,657, commercial 22,830.

Finance. (Million pesos). Budget: (1950, actual) revenue 570.2, expenditure 525.4; (1951 est.) balanced at 461; (1952 est.) balanced at 632.7. Public debt (Dec. 31, 1950): 511.4. Currency circulation (Sept. 30, 1951): 406.3. Gold reserves (May 1951) U.S. \$66 million. Monetary unit: *peso* with an official exchange rate of U.S. cents 39.84 (Nov. 1951). (J. W. Mw.)

COLOMBO PLAN. The report published in Nov. 1950 by the Consultative Committee for South and South-East Asia came to be known as the Colombo plan. The committee, set up under Commonwealth auspices to find means of improving economic conditions in the area, met at Sydney in May 1950 and London in Sept. 1950 at ministerial level and a Standing Committee on Technical Assistance met in Colombo in July 1950. The founder members of the committee were Australia, Canada, Ceylon, India, New Zealand, Pakistan and Great Britain, but the non-Commonwealth countries in the area were invited to co-operate in a comprehensive attack upon poverty and under-development in the region as a whole. Vietnam, Laos and Cambodia subsequently joined the Consultative committee; Burma, Indonesia, the Philippines and Thailand had not made their decision by Dec. 1951, but sent observers to the committee's meetings.

The Colombo plan did not take the form of a blueprint drawn up for the area as a whole. It comprised a number of separate six-year development programmes drawn up by

individual participating governments. There would be discussion in the Consultative committee on common problems and a co-operative attack on low standards of living, although aid would be provided on a bilateral basis. The development programmes of India, Pakistan, Ceylon and the British territories in Malaya and Borneo during 1951-57 would cost (on the basis of 1950 prices) approximately £1,900 million of which about half would be financed externally.

Although the six-year period covered by the plan only began on June 30, 1951, a number of important developments occurred during the past year. The original participants announced their contributions for 1951-52: Australia £7 million (out of a total of £25 million for the six-year period), Canada \$25 million and New Zealand £1 million, while the chancellor of the exchequer announced that during the period 1951-57 Great Britain's contribution, including the repayment of sterling balances, might amount to well over £300 million. Bilateral discussions also took place on the capital equipment, services, etc., to be supplied to recipient countries.

On Jan. 24 the United States joined the Consultative committee and the U.S. secretary of state, Dean Acheson, said his government would co-ordinate any aid they might give to the area with that given under United Nations or Commonwealth auspices. Subsequently the U.S. lent two million tons of wheat to India to relieve the food shortage; the counterpart funds for which would be used by India to finance development. Arrangements were also made to associate the International Bank for Reconstruction and Development with the plan and both the U.S. and the bank were represented at the third meeting of the Consultative committee held in Colombo in February. At this meeting the question of a continuing organization and the machinery for negotiating aid were discussed.

The Consultative committee also set up the technical co-operation scheme with funds of up to £8 million during the three years 1950-53 to ensure that the main development programmes did not fail through lack of technical necessities. Of these funds Great Britain and Australia were to contribute up to £2,800,000 each, New Zealand £400,000, India £750,000, Pakistan £175,000, Ceylon £400,000, and Canada gave \$400,000 as a first year contribution. The scheme operated through a bureau in Colombo which was responsible to the Council for Technical Co-operation. During 1951 substantial progress was made, and several hundred requests for experts or training facilities from India, Pakistan and Ceylon were successfully dealt with.

COMMERCE: *see* BUSINESS REVIEW; CHAMBERS OF COMMERCE; INTERNATIONAL TRADE.

COMMONS, HOUSE OF: *see* PARLIAMENT, HOUSES OF.

COMMONWEALTH OF NATIONS. The self-governing territories are dealt with under the sub-heading *Dominions and India* and the others, which include colonies, protectorates and trust and mandated territories, under *Colonies*. The table gives essential data as at Dec. 31, 1951.

Dominions and India. The meeting of the prime ministers of the commonwealth in London, Jan. 4-12, 1951, was well-timed for it took place at a moment when it seemed that Chinese intervention in the Korean war might lead to divided counsels within the Commonwealth, and between some Commonwealth countries and the United States. If these serious risks were not finally removed, it was at the least apparent that their discussions produced a wide measure of agreement. In the words of Louis St. Laurent, the Canadian prime minister, the Commonwealth statesmen at this meeting had sought once again to contribute to the building "of a

new bridge of understanding between the east and the west." The final communiqué issued on Jan. 12 stated that the main purpose had been to review the international situation and to consider what further positive action the Commonwealth governments could take to preserve world peace. There was agreement on the urgency of promoting a satisfactory settlement in the far east and, apart from the immediate problems of the Korean war, the prime ministers discussed the terms of the peace settlement with Japan and the safeguards which should be included in it. In respect of western Europe the prime ministers of the United Kingdom and Canada explained the measures being taken to give reality and strength to the North Atlantic Treaty organization and the meeting as a whole agreed that they should recommend to their respective governments a strengthening of the existing Commonwealth machinery for consultation on economic questions with a view particularly to resolving the problems arising from the shortage of raw materials.

Far more remarkable than the formal communiqué was a declaration issued by the prime ministers on the same day. This expressed the belief that the unique quality of the Commonwealth derived from the fact that it embraced nations and peoples from every continent and that this quality gave to its statesmen both special knowledge and special responsibilities. Their paramount aim was the preservation of peace and if that were to be attained they believed that the wounds of World War II had to be healed by early peace settlements with Germany and Japan; and more important still that there had to be a real attempt to understand those "who appear to differ from us." "The great antidote to war is hope; its greatest promoter is despair. When we say that war is not inevitable, we do not just mean that we shall prepare and be strong, and that our strength may deter aggression. We also mean that, in a world worn out and distorted by war, there must be an overwhelming majority of the people of all lands who want peace. We must not despair of reaching them." The ministers recognized, too, that peace could not be secured while large parts of the world continued to live

The first Gold Coast elections were held in Feb. 1951. Symbols (elephant, left, and fish, right) used to help illiterate voters are shown here.

King George VI with his prime ministers in the state dining room in Buckingham palace, London, Jan. 4, 1951. Left to right: T. E. Donges (representing South Africa); D. S. Senanayake (Ceylon); Sir Godfrey Huggins (Southern Rhodesia); S. G. Holland (New Zealand); R. G. Menzies (Australia); Queen Elizabeth; King George; Duchess of Kent; L. S. St. Laurent (Canada); C. R. Attlee; Princess Margaret; Jawaharlal Nehru (India). Liaquat Ali Khan (Pakistan) did not arrive in London until Jan. 7.

in poverty and they laid special emphasis upon the working out of the Colombo plan (*q.v.*) as practical evidence of the resolve of the Commonwealth countries to contribute schemes for developing economic resources and raising social standards.

At informal gatherings representatives of all the Commonwealth countries, except South Africa, took part in discussions on the Kashmir dispute from which at first it was hoped that some compromise solution would emerge. But such hopes proved unfounded and Liaquat Ali Khan (Pakistan) later revealed that three proposals which had been made for holding a plebiscite in Kashmir all proved unacceptable to India. In this respect the conference broke up on a discouraging note, and members of the Commonwealth watched not without anxiety the subsequent efforts of the United Nations special representative on Kashmir to bring about a compromise.

Daniel Malan, South African prime minister, put forward two demands of political importance for the Commonwealth as a whole. The first related to the transfer to South Africa of the three high commission territories; the second was provoked by a speech of the secretary of state for the colonies welcoming the advance of the Gold Coast towards full Commonwealth membership. "Here," said Malan, "we have a glaring anomaly in existing Commonwealth relations." The Commonwealth was a closed group, all free and all equal, but in the admission of new members it would seem that Great Britain felt in a position to act on her own. "This

anomaly," demanded Malan, "should be removed without delay" in the interests of the cohesion and homogeneity of the Commonwealth group which was threatened by British policy. In London the existence of the anomaly was questioned and in many parts of the Commonwealth there was strong dissent from the implications behind Malan's words.

In Australia there were celebrations for the jubilee of confederation and in New Zealand for the Canterbury centenary. Both attracted many distinguished Commonwealth visitors including Don Senanayake, the prime minister of Ceylon. But of greatest significance was the Pacific Security agreement with the United States. On April 19, President Truman announced that in relation to the Japanese peace treaty the governments of Australia and New Zealand had suggested a security arrangement between them and the United States and that he had agreed that some such arrangement would help to strengthen the fabric of peace in the Pacific. Frederick Doidge, New Zealand minister for external affairs, saw that this arrangement "would liberate us from the nightmare of a resurgence of Japanese militarism." The treaty between the three countries was signed in San Francisco on Sept. 1.

The economic policies referred to in the communiqué of the Prime Ministers' conference resulted in further steps to implement the Colombo plan and in the holding of a Commonwealth conference in London in September on the production, supply and exchange of raw materials which were of pressing concern in view of the increasing rate of re-armament.

conference in London (June 21-26), emphasized the importance of middle east defence to the Commonwealth. Later the denunciation of the Anglo-Egyptian treaty by Egypt elicited from Commonwealth countries and particularly from Australia and New Zealand statements condemning Egypt's unilateral abrogation and re-emphasizing the supreme importance of the Suez canal as a traditional artery of empire.

It was with the greatest concern that news of King George VI's serious illness and operation was received and it was announced in October that he had regretfully decided to abandon his projected tour of Australia and New Zealand in 1952; Princess Elizabeth and the Duke of Edinburgh would, however, carry out the tour for him. In October and November the princess and the duke visited Canada where they received an enthusiastic welcome.

The Conservative victory in the general election in the United Kingdom in October brought Lord Ismay as secretary of state for Commonwealth relations and J. G. Foster as parliamentary under secretary. (N. MGH.)

Colonies. The general election brought Oliver Lyttelton as secretary of state for the colonies, Alan Lennox-Boyd

as minister of state, and the Earl of Munster as parliamentary under secretary. A statement by the secretary of state in the House of Commons on Nov. 14 indicated that there would be no immediate change in colonial policy.

The postwar development of air transport had had a remarkable effect on colonial administration by enabling both ministers and the permanent officials of the Colonial Office to acquaint themselves at first-hand with conditions in the colonies and by making possible in the United Kingdom frequent conferences attended by colonial officials and others. Lyttelton visited Malaya, Singapore and Hong Kong in December. His predecessor, James Griffiths, had visited east Africa in May and central Africa, in connection with the federation proposals, during August and September and John Dugdale, the minister of state, toured Fiji and the western Pacific at the same time.

Conferences of officials held in the United Kingdom included police commissioners in April, financial secretaries and public relations and information officers in June and heads of labour departments in October. The meeting in September of Commonwealth ministers concerned with supply and production was attended by 21 colonial advisers

Voters, including women in purdah, lining up outside a polling station in Delhi. In Oct. 1951 voting began in India's first general election. The electorate of about 175 million was the largest in the world.

from some 15 territories. In June a West Indian trade delegation visited London for talks with United Kingdom officials before proceeding to Canada to discuss Canadian-West Indian trade.

But perhaps the most important gathering was the visit of 90 unofficial colonial representatives, for the most part members of their local legislative councils, to the Festival of Britain as guests of the United Kingdom government. In addition to various visits the visitors heard authoritative expositions of policy from leading members of the government. The opportunity of festival year was taken to refurbish many of the permanent colonial exhibits in the Imperial institute, and to stage there the exhibition, "Focus on the Colonies," which had toured the provinces the previous year and an exhibition of traditional colonial art, opened by King George VI on May 24.

The first aim of British colonial policy—to guide the dependent territories to self-government within the Commonwealth—was carried forward with determination; the new constitution of the Gold Coast came into effect in January, and among the new constitutions or important changes in existing constitutions promulgated during the year were those for Nigeria, the Gambia, Sierra Leone, the Windward and Leeward Islands and Singapore. But economic development of the colonies to provide a sound foundation for self-government proved more intractable. The scaling down of the Overseas Food corporation's groundnut project in Tanganyika was followed by the news that a number of the Colonial Development corporation's projects had proved uneconomic and were to be discontinued. In other respects, however, the period was one of steady advance. The report on progress under the Colonial Development and Welfare acts for the year to March 31, 1951, showed that approval had been given in that year to development and welfare schemes involving grants of £11,547,111 and to research schemes for which the United Kingdom contribution would be £2,496,784. The actual payments in the year amounted to £13,271,424, of which £1,406,651—the largest amount disbursed since the first act was passed in 1940—was spent on research. During that same period some 57 new and 60 supplementary schemes of research were approved.

Some of the most marked advances in the postwar years had been in the sphere of education, especially higher education. The three colonial universities and four university colleges in 1950-51 had a total student roll of 3,056, while staffs, excluding the Royal University of Malta, where much of the teaching was undertaken by part-time staff, numbered 388 whole-time professors and lecturers. During 1951 plans took shape for, and in some cases work began on, colleges of arts, science and technology complementary to the university colleges and intended to provide technical and commercial education to a professional level. Meanwhile in an attempt to ensure that the educational advance would proceed on a sound basis the Colonial Office and the Nuffield foundation jointly sponsored a project to study the policy and practice of education to secondary standard in British tropical Africa; two small groups of independent experts, one visiting west Africa and the other east and central Africa, were spending about six months consulting with educationalists, administrators and members of the public on educational policy.

COMMUNIST MOVEMENT. There was no radical change in the position of the world Communist movement in 1951, nor was there any indication that its

fundamental organization and strategy were being subjected to any important revision. The Soviet Union continued to be the accepted centre of the movement, and Communist orthodoxy to be tested by its decisions.

Asia. The Chinese People's government, wholly Communist-controlled and professing complete adherence to the Soviet pattern of development in home and foreign policy, was far and away the most important of the Communist authorities outside Russia. As its own internal position seemed to strengthen, its capacity to take an independent line seemed to become less doubtful, but there was nothing to suggest that its leaders had in mind any policy but that of Russia.

In both Korea and French Indochina it was China that appeared to be the main spearhead of the effort to spread Communism. In neither area was pronounced success achieved (*see* KOREAN WAR for truce negotiations). In Indochina, the inspiring leadership of General Jean de Lattre de Tassigny and the promise of increased material help from the United States made the outlook for the French less hopeless. As Malaya showed, however, it was still possible for small numbers of Communists to maintain a rural reign of terror indefinitely and to suck away a country's economic prosperity and morale. The problem of enlisting mass popular support against the Communists had obviously not been solved. In Malaya, the murder of Sir Henry Gurney, the high commissioner, in October and successful attacks on British forces showed that the Briggs plan for resettling the Chinese squatters had not produced the results expected from it. Fighting also went on in Burma and the Philippines.

The central fact of the situation in Asia was that most Asian peoples and their governments were not convinced that Soviet-inspired communism was more of a threat than the old "western imperialism" against which their national movements had traditionally been directed. Countries like India and Burma would not automatically take the side of the west in its effort to build up a barrier against Communist penetration. And the refusal of India and Burma to sign the Japanese peace treaty, which was primarily concerned with building up this barrier, was proof of this awkward reality. The result of the elections in Israel in the summer showed that the neutralist forces had lost ground, but even then the Israeli government hesitated to commit itself wholeheartedly to the west.

A cartoon "Lost Horizon" by Gabriel, published in the "Daily Worker" (London) June 1, 1951, after the announcement of the negotiations between China and Tibet.

Western Europe and United States. Neutralism in the face of the Communist threat was not confined to Asia. In France, the June elections showed that the Communist party had lost some 9% of its voting strength compared with the elections of 1946; but with almost 5 million voters, their poll represented a fifth of the electorate and they were the strongest single party. But it is important to notice that the

Communists in France were in a position to exploit the sentiments of those non-Communists who felt that their country had not the strength for the full-scale effort demanded by the western defence plans and that it could still contract out of an "American" war.

The French Communists showed little sign of reconsidering their adherence to Soviet policies or of internal dissension. But in Italy, at the beginning of the year, much excitement was caused by the resignation from the party of two Communist deputies, Aldo Cucchi and Valdo Magnani. And in March, Giancarlo Matteotti, the son of the socialist leader murdered by Mussolini, attacked the subservience to Russia of his own party, the fellow-travelling "Nenni socialists." There was, however, no large follow-up of these desertions, and the severe losses sustained by the Italian Communists in the municipal elections in May and June were attributable to the electoral combinations formed against them, rather than to any falling-off in support for them. The plain fact was that the Communists and their associates still numbered 35.5% of the Italian electorate.

In Great Britain the situation was different. There, the October general election found the Communists withdrawing all but ten of their candidates and advising their supporters in other constituencies to work and vote for the Labour party candidates on the familiar principle of choosing "the lesser evil." Their candidates all lost their deposits. The United States continued to show great determination to put legal obstacles in the way of Communist propaganda, but the political excitement generated over the alleged penetration of Communist influence into many important spheres of national life and of government suggested that there was a danger of the whole thing degenerating into a mere heresy hunt in which the fundamental definition of a contemporary Communist, "one who takes his ideas and his orders from Moscow", might be overlooked.

The western world had two important points of contact with the Communist movement other than those in Asia. The dissident régime of Marshal Tito remained in power in Yugoslavia despite the menaces of the U.S.S.R. and its satellites, and received increasing material assistance from the west. It was still difficult to see how far its dependence on such assistance would bring it closer to the west in its general outlook on world affairs or in the sense of a liberalization of its internal régime. More important was Germany where the Federal government attempted to put some legal curb on Communist propaganda. Here, as the full integration of the Federal republic into the western system became a more immediate prospect, the Communists increasingly sought a method by which this process, so dangerous to the

Palmiro Togliatti, secretary general of the Italian Communist party, seen addressing a meeting in Rome, April 15, 1951. He had just returned to Italy after spending two months in the Soviet Union.

Russians, could be arrested. This led in the late summer to the offer of free all-German elections on conditions which, if genuinely carried out, would inevitably mean the liquidation of the Eastern German Communist régime itself. It was not clear, any more than with similar offers in the past, whether this was more than an attempt to cause confusion in western circles. If the offer were genuine it would be yet another proof of the absolute readiness of the Soviet Union to sacrifice foreign Communist movements and governments

TABLE I. COMMUNIST PARLIAMENTARY REPRESENTATION IN EUROPE*
(Figures in brackets are those of the preceding election)

	Date of last election	Votes obtained	% of total votes	Seats obtained by Communists	Total number of seats

* Only European countries having a parliamentary system and free elections are included. Ireland is omitted: the only Communist candidate, Michael O'Riordan, chairman of the Irish Workers' league, obtained at Dublin 300 votes.

† Communists and fellow travellers elected under the banner of Finland's Popular Democratic league (S.K.D.L.).

‡ This includes small Communist-controlled groups.

§ There were in 1951 only 10 Communist candidates compared with 100 in 1950.

|| This represents the number of votes obtained by the Democratic Popular front, that is, the Communists and the left-wing Socialists. Out of 183 deputies elected 132 were Communists.

A cartoon "Tentacles of Washington Octopus" by J. Paulo, which was published on July 27, 1951, in the Cominform journal "For a Lasting Peace for a People's Democracy!" (Bucharest).

where this was necessary for some wider purpose of Soviet strategy.

Eastern European Satellites. The strengthening and unifying of the Communist bloc itself was relentlessly pressed forward. The most important of the processes, obviously centrally directed, by which this was done was the continuation of the purges within the Communist parties of the European satellites of the U.S.S.R. More prominent figures were removed from public life and others previously arrested were tried. It seemed likely that the removal of important Polish military figures and the prosecution of members of the former Polish Peasant party were merely preludes to a trial of Władysław Gomułka, the former secretary general of the Polish Communist party. It was not clear that the victims of the purges had anything in common other than their unwillingness for some reason or other to follow exactly the Soviet line.

The importance attached by Moscow to the Tito dissidence was shown by the continued effort to brand as Tito-inspired all signs of a critical attitude in the remaining

TABLE II. ESTIMATED MEMBERSHIP OF THE COMMUNIST PARTIES

A. Communist-Controlled Countries			
U.S.S.R.	6,000,000	Hungary	862,114
China	5,800,000	Rumania	720,000

Sweden	33,000	North America	
Denmark	22,500	United States	54,174
Norway	14,000	Canada	15,000

satellites. In Warsaw in July V. M. Molotov made a violent attack on Tito. Similar attacks were made by Marshal K. E. Voroshilov when he visited Rumania in August and by Marshal V. D. Sokolovsky when he visited Bulgaria in September. This insistence on total subordination to Moscow must be taken alongside the continued battle against "nationalism" in some of the republics of the U.S.S.R. which figured prominently in the Soviet press. The possibility of internal dissension was more genuinely worrying to the Communist leaders than the alleged "war-mongering" of the non-Communist world.

The "Peace" Movement. The World Peace movement could hardly be regarded as anything other than an instrument of Soviet foreign policy. The Stockholm appeal, with its statement of the principal international objectives of the Soviet Union, continued to take pride of place. And, alongside the collection of signatures to it, there was the passage in the early part of the year in the countries of the Soviet bloc of a "law for the defence of peace" rendering illegal all "war propaganda" of the non-Soviet kind. It was not difficult to see the threat which this "law" conveyed to Western German politicians. In February, the World Peace council, the central organ of the movement, met in Berlin and adopted the usual set of resolutions condemning German rearmament and calling for a five-power peace pact. The council also echoed the criticism of the United Nations contained in an interview with Joseph Stalin published in the same month.

The council had appointed a delegation to present to the United Nations the resolutions of the Warsaw congress of 1950. But, despite the intervention of Yakov Malik during his term of office as president of the Security council, the U.S. State Department refused to grant the delegation the necessary visas. On June 28 Malik countered by receiving two members of the Peace council who were in America, and by circulating subsequently as documents of the Security council the resolutions thus presented to him.

The Soviet government was in a position to secure also ecclesiastical support for the Communist peace campaign in the form of an "appeal to Christians of the whole world" issued on July 23 over the signatures of the patriarchs of the Orthodox Churches of Antioch, Russia, Rumania, Georgia and Bulgaria. The Stalin peace prize was awarded to Dr. Hewlett Johnson, dean of Canterbury, one of the most zealous English exponents of Communist views.

Communist propaganda was also served by the fact that the Soviet leaders, despite their intransigence over almost all concrete questions at issue between themselves and the rest of the world, were continually emphasizing their devotion to the idea of the "peaceful co-existence" of the two systems, socialism and capitalism, and were showing some readiness to make this a reality in the sphere of trade. From mid-July, Moscow began the publication of a new English-language fortnightly, *News*, which in relatively un-Marxist terminology devoted itself to stressing the prospective benefits of collaboration between the Anglo-Saxon countries and the Soviet Union.

Anti-Communist Legislation. In Australia, R. G. Menzies' government, which had received wide electoral support, was denied, in a referendum, the new constitutional powers which it felt it required to combat Communism. (M. BLF.)

CONGO, BELGIAN: see BELGIAN COLONIAL EMPIRE.

CONGREGATIONAL CHURCHES. The first year of the Forward movement of the Congregational Churches of England and Wales ended successfully at the 1951 May assembly meetings. This preparatory year consisted largely of local gatherings of ministers and office bearers to consider

the significance of the call to deeper spiritual life and richer churchmanship. There was also an appeal for a sum of money to facilitate further church extension and to help to finance the work of the denomination. By means of a single gift day, £50,000 was raised. The Forward movement then entered its second stage, in which the concern was for the better equipment of churches. A feature was a series of mass meetings held in important centres. The third stage of the Forward movement was to be an attempt to win new members.

Assembly meetings in 1951 were distinguished by the holding of a joint session with the Presbyterian Church of England. At this was read the declaration towards co-operation and shared counsels which had been agreed the previous year, and the united company thereupon reaffirmed this decision.

At the end of the war the Congregational Churches of England and Wales raised £500,000 towards the reconstruction of destroyed and damaged buildings. The reconstruction fund was being used to supplement war damage grants and by the summer of 1951 about £250,000 had been thus used. One of the churches which was thus substantially aided was chosen as a Festival of Britain architectural exhibit.

The London Missionary society, the foreign mission agent of the Congregational Churches, was compelled to withdraw from the China field during 1951, and this led to a decision to work among the Chinese in Hong Kong and Malaya. The Colonial Missionary society, the Commonwealth and colonial agent of Congregationalism, raised about £10,000 for the relief of distress among the Congregational Churches of Jamaica following the severe hurricane in August.

The Rev. Leslie J. Tizard, minister of Carrs Lane church, Birmingham, since 1941 and editor of the *Congregational Quarterly* from 1946 to 1948, was appointed chairman elect of the Congregational unions for 1951-52.

The bicentenary of the death of Philip Doddridge, distinguished Congregational hymn-writer, was celebrated in October. (R. F. G. C.)

United States. On Jan. 1, 1951, the total number of Congregational Christian Churches in the United States was 5,651 with 1,227,527 members, 5,728 ministers and 619,679 church school members. During 1950, 48,902 persons were received into the churches on confession of faith—the largest total on record. During that year the churches contributed \$5,522,234 to charities and \$31,530,701 to local church support.

During 1951 Sidney M. Berry, of London, the minister and secretary of the International Congregational council, visited the United States. Plans were ratified for the holding of the next meeting of the council in Scotland in 1953.

During 1951 the American Board of Commissioners for Foreign Missions, the Congregational Christian foreign missionary board, withdrew its missionaries from China, only three remaining there at the end of the year because they were unable to get passages from Chinese ports.

At the end of 1951 the matter of the merger of the Congregational Christian Churches with the Evangelical and Reformed Church had just come to the appellate division of the supreme court of New York state for review (see *Britannica Book of the Year 1951*). (D. Ho.)

CONGRESS, U.S. The 82nd congress, which convened on Jan. 3, 1951, was composed of 49 Democrats and 47 Republicans in the Senate, and of 235 Democrats, 199 Republicans and 1 Independent in the House of Representatives. More conservative than its predecessor, it immediately restored to the Rules committee of the House the controlling powers of which it had been deprived in 1949. The Democratic majority chose Senator E. W. McFar-

land as floor leader and Senator L. Johnson as whip. In the House, Speaker S. Rayburn was re-elected for a sixth term.

More even than its predecessors, this congress showed a preoccupation with foreign and defence problems, both in its legislative and investigatory activities. It conducted 134 investigations—a record. Of these the most notable were the Senate's Armed Services and Foreign Relations committees' inquiry into General Douglas MacArthur's dismissal, the Senate Crime Investigating committee's inquiry led by Senator E. Kefauver, and the Senate Banking subcommittee's investigation of the Reconstruction Finance corporation. The session began with a "Great Debate" on foreign policy spread over three months and concluding with the passage of a resolution which approved the dispatch of four divisions to General Dwight D. Eisenhower's European command, but attempted to make the dispatch of any more dependent on further congressional sanction. Legislation was passed extending military selective service until July 1, 1955, lowering the draft age from 19 to 18½, increasing the period of service from 21 to 24 months and providing for the eventual establishment of a system of universal military training. The largest peacetime defence appropriations bill in history was passed, totalling \$57,000 million and providing for an increase in the air force from 90 to 140 groups. For foreign aid congress voted \$7,328 million out of the \$8,600 million requested by the president. Total appropriations reached the peacetime record of \$96,000 million. Taxes adequate to provide for these were not voted, but on the last day of the session a bill was passed providing for a tax increase of \$5,691 million.

Congress extended the reciprocal trade agreements programme for another two years, though with four amendments restricting the president's power to reduce tariffs. The Defence Production act, which provided for controls on prices and wages, was similarly extended for 12 months with restrictions on the president's previous authority. An amendment to the Taft-Hartley labour act was passed, concerning union shop agreements. Two bills providing ex-servicemen's pensions were passed over the president's veto.

During the session two senators died, V. Chapman (Democrat) of Kentucky and Arthur H. Vandenberg, the distinguished Republican leader from Michigan. Democrats were appointed to fill both vacancies, thus increasing the Democratic majority in the Senate to 6. After congress adjourned on Oct. 20 Senator K. S. Wherry of Nebraska, Republican floor leader, also died. (H. G. N.)

CONSERVATIVE PARTY: see POLITICAL PARTIES, BRITISH.

CONSUMER CREDIT. The year 1951 saw a considerable change in the field of consumer credit in Great Britain. For the first three months, retail sales appeared to be maintaining satisfactory figures, but by the late spring or early summer reports from all parts of the country, and covering a wide range of goods, showed that purchases were being substantially reduced: with the increased cost of living the lack of money for commodities other than food was the main cause. As a result short-term retail credit was inclined to fall. The same conditions, however, brought an increase in the amount of hire purchase and long-term credit asked for and extended. This was specially so in the case of sales of such items as furniture, refrigerators, cars and radio and television sets. The retailer, faced with falling sales and, generally speaking, ample supplies, found the only way to maintain a reasonable turnover was to provide long-term credit.

Collections, although becoming more difficult in some cases, remained satisfactory on the whole. More care had apparently been used in selecting customers to whom credit was given and more attention paid to the need for keeping such payments to the agreed terms. At the government's request, the banks continued to limit advances to traders to finance long-term credit on consumer goods. This made it difficult for some retailers to handle all the hire purchase business offered to them. No new regulation affecting hire purchase terms was made. (C. C. Ws.)

Canada. Federal credit curbs imposed on Nov. 1, 1950, did not restrict instalment buying sufficiently to reduce inflation. Accordingly, in March 1951 regulations were tightened. The new orders called for an increase of down payment on car purchases from one-third to one-half, an increase of minimum down payments on other consumer goods from one-fifth to one-third, an increase of minimum monthly instalments from \$5 to \$10 and a reduction of the maximum instalment period from 18 to 12 months. Canadian motor car and electrical goods manufacturers complained that the tougher credit restrictions caused a major slump in sales, and by mid-year there were a number of job lay-offs in those production fields.

The Bureau of Statistics released in August its new consumer credit analysis, which showed for the first time the estimated value of retail sales in 13 key trades. For the first quarter of 1951 retail sales were \$2,155 million of which 8% were on the instalment plan, as compared with 7.2% for the first quarter of 1950. (C. Cy.)

United States. The volume of consumer debt outstanding for the first time since World War II remained stable, being at both the beginning and end of the year about \$20,000 million, as against a more than 20% increase during 1950. It may be compared with a 5% increase in personal consumption expenditure during 1951, a 9% increase in personal disposable income and a more than 100% increase in personal savings.

Several factors were responsible for this stability. First, the buying sprees set off by the war in Korea had somewhat slaked the demand for durable goods and such goods did not thereafter move from merchants' inventories to their accounts receivable as rapidly as they had previously been moving. Secondly, the increase in taxes and the continued rise of prices checked expenditures. Thirdly, caution on the part of many consumers made them savers rather than spenders. And fourthly, restraints and credit control upon buying diverted the purchases of some consumers.

Not all forms of consumer credit fared alike. A decline in debt incurred in the purchase of goods occurred in the sales of articles other than automobiles, such as electrical appliances, furniture, etc. Non-instalment debt increased in all categories: single-payment loans, charge accounts and service credit.

The National Retail Credit association passed a resolution recommending discontinuance of use of the term "loss" for uncollectable credits. It was proposed that what had been regarded as bad debt "loss" be referred to as "accounts receivable markdown." To the profession this distinction represented a step in the evolution of the credit function from mere guardianship of funds, in which every loss was to be avoided, to the conception of credit as a facilitation of sales, in which case in order to maximize sales risks of questionable quality were sometimes intentionally accepted with the presumption that a number of the accounts would be uncollectable. Under the latter conception, bad debts were regarded more or less as a sort of sales expense.

By an amendment on July 31 to Regulation W the time period¹ for all durable consumer goods bought on instalment was increased from 15 to 18 months. Down payments on automobiles were left at 33%, but those required for house-

hold appliances were reduced from 25% to 15% and traded-in articles were made acceptable as part of the down payment. (R. BA.)

CONTRACT BRIDGE. The European championship was played at Venice and was won by Italy. Austria was second, Great Britain third, Egypt fourth, Sweden fifth. The British team was: J. T. Reese and B. Schapiro, L. Tarlo and N. Gardener, A. Truscott and R. d'Unienville, I. Macleod (non-playing captain). The ladies' championship was won by Great Britain, with Denmark second. The British team was: Lady Rhodes and Mrs. R. Markus, Mrs. P. Williams and Mrs. H. R. Evans, Mrs. F. Gordon and Mrs. A. L. Fleming, S. Lee (non-playing captain).

A match for the world championship between Italy and the United States was won by the U.S. by 116 match points. The U.S. team was: H. Schenken, J. Crawford, F. Stayman, G. Rapee, B. J. Becker and J. Rosenblum (captain).

In Great Britain the winners of the principal competitions were: Waddington cup for masters pairs, R. Swimer and R. Preston; national pairs, J. T. Reese and A. Meredith; Gold cup, L. Tarlo (captain) and N. Gardener, L. Baron and A. Rose; Crockford's cup, J. Pavlides (captain) and L. Dodds, K. W. Konstam and G. Mathieson.

The Camrose trophy, played between the countries of Great Britain, was won by England, with Scotland runner-up. The Contract Bridge Association of Ireland announced that its team would not enter for this contest in future. (T. RSE.)

CO-OPERATIVE MOVEMENT. The International Co-operative alliance held its 18th congress at Copenhagen in Sept. 1951. The affiliated membership was 98,175,000 in 30 countries. This total was made up of 52,990 consumers' societies and 40 wholesale societies, with 59,348,000 members; 11,560 industrial producers' societies, with 749,000 members; 70,530 agricultural societies, with 17,801,000 members; 225,500 credit societies and 16 co-operative banks, with 18,333,000 members, and a number of miscellaneous bodies, with 1,944,000 members. There were also 42 co-operative insurance societies, covering 36,380,000 insured persons. For reasons of overlapping, these last are not included in the total. The total trade of the affiliated retail consumers' societies was £1,829 million, of the wholesale societies £700 million, of the producers' societies £142 million, and of the agricultural societies £1,203 million. Savings deposits in the banks and credit societies totalled £447 million, and turnover £8,474 million. Premium income of the insurance societies was £86 million. (Figures mainly relate to 1949; they do not include the large totals of co-operative bodies not belonging to the I.C.A.) Among the non-affiliated movements were those of China, Hungary, Poland, the British colonies (except Jamaica) and most of Latin America; and there were many unaffiliated bodies, especially agricultural and credit societies, in other countries. The I.C.A., however, still included the co-operative movements of the Soviet Union, Bulgaria, Czechoslovakia and Rumania, as well as those of the countries outside the Soviet sphere of influence. The countries of the Soviet group retained their connection with the I.C.A. despite its domination by the western movements. At Copenhagen, the conflict between the two blocs came to a head. The action of the central committee in prescribing conditions for new affiliations in such terms as to rule out the co-operative movements of the Soviet countries was challenged by the Russians, the Italians and other groups as contrary to the constitution,

but the committee's action was upheld by 623 votes to 353. This involved the rejection of the applications for admission of the new Polish co-operative organization and also of that of the co-operative movement of Eastern Germany. The ground for exclusion, laid down in the committee's regulations and approved by the congress, was that "free" co-operative movements could not exist in totalitarian countries. The Soviet group also endeavoured to persuade the I.C.A. congress to adopt a peace resolution corresponding to the terms of the Communist peace campaign; but the congress adopted a resolution on different lines, embodying specific references to the need for freedom of speech, movement, organization, real democratic elections, co-operative independence, and action through the United Nations in the spirit of the Atlantic charter. Other issues dealt with at the congress included the need to adapt the I.C.A. more effectively to meet the needs of the agricultural co-operative movement, for which a special section was set up; the demand for effective action on a world-wide scale against restrictive monopolies and for the nationalization of commodity distribution; proposals for the development of international co-operative trade and for the removal of hindrances in the way of the international co-operative trade in petroleum products; and projects for the expansion of co-operative educational activities. The U.N. Economic and Social Council was censured for blocking the discussion of the petrol question, and extended powers were demanded for procuring the discussion of such matters at the instance of the collaborating agencies (such as I.C.A.) recognized by the United Nations. During the year Thorstein Ohde resigned his position as director of the I.C.A. and was succeeded by W. P. Watkins. The congress increased subscriptions, mainly in order to extend its work in connection with U.N. and with the fostering of co-operation in the less advanced countries.

Great Britain. At the end of 1950, British retail consumers' societies had 10,691,000 members, as against 10,413,000 at the end of 1949. Share capital fell, because of withdrawals, from £238 million to £232 million, but loan capital rose from £62.5 million to £64 million. Employees increased from 270,000 to 277,000, and total retail trade from £549 million to £614 million. Average dividend rates continued to fall—from 1s. 4½d. in the £1 in 1949 to 1s. 3½d. in 1950. There was much discussion concerning possible means of arresting this fall, which was due mainly to the narrowing of trading margins under government control of prices. The English Co-operative Wholesale society's trade rose from £291 million to £321.5 million, and that of the Scottish C.W.S. from £62 million to £68 million, the increases being caused largely by rising prices. The productive societies' trade showed only a small increase, from £6,072,000 to £6,161,000. Following the establishment in 1950 of a dockers' co-operative society for handling cargoes at Grimsby, a similar society was set up on Merseyside in 1951, but met with considerable opposition from the trade unions as well as from port employers. At the general election of Oct. 1951 the Co-operative party, fighting in alliance with the Labour party, put forward 38 candidates, of whom 16 were successful, as compared with 18 in 1950. Discussions continued between the Co-operative and Labour leaders on the question of further policy in respect of nationalization and development of co-operative enterprise.

Other Countries. In the British colonies, notably West Africa and the West Indies, co-operation continued to expand with government encouragement. The West German movement also continued to regain strength, but attempts to re-establish unity with the movement in Eastern Germany met with no success. In Yugoslavia there was a considerable liberalization of co-operative policy, as the pressure for

collectivization was further relaxed. The Chinese movement was brought more fully under Communist control. The Italian movement remained predominantly under Communist influence. (G. D. H. C.)

United States. During 1951 consumer co-operatives in the United States petroleum industry continued to grow. About 2,300 local co-operatives distributed 1,400 million gal. of fuel, primarily to farmers. This represented 2.25% of the total domestic consumption of petroleum products.

Co-operative credit unions continued their spectacular growth by adding nearly 100 new credit co-operatives a month during the year. This brought credit union membership to a total of 6 million in the U.S. and Canada in 12,000 local associations. Rural electric co-operatives added 68,000 mi. of lines and 250,000 new consumer-owners in 1951, bringing the total number of members to 3.5 million. During the year 54 telephone co-operatives took steps to modernize and streamline their operations for about 100,000 subscriber-owners.

Co-operative housing associations under the new co-operative section of the Federal Housing administration completed their first few units in 1951. At the end of the year about \$60 million worth of co-operative housing was under construction, and F.H.A. had received applications for more than \$300 million worth of this type of housing.

The consumer food store field saw the opening of several large supermarkets during the year, and the business done by established food co-operatives continued to grow. This section of the co-operative movement was still small compared with other fields of co-operation, but included about 1,000 food stores with business totalling about \$1,000 million annually. The insurance companies, members of the Insurance Conference of the Co-operative league, reported gains in policy holdings and memberships. The largest group in the field, the Farm Bureau Insurance companies with headquarters in Columbus, Ohio, marked their 25th anniversary by moving into a \$6 million headquarters building. During 1951 the Farm Bureau group served about 1.5 million policy holders in 12 eastern states.

Co-operative health associations and co-operative hospitals were reported to the U.S. senate committee on health and public welfare as a possible pattern for a "middle way" in the health field; but opposition to consumer-owned health services by the American Medical association continued. Health associations affiliated with the Co-operative Health Federation of America reported a membership of 600,000. An additional 5 million consumers were served by labour union health programmes and other non-profit associations.

The largest co-operative activity in the U.S. was the marketing of farm products. Activities in such fields as cotton, dairy products, fruit and vegetables, grain, dried beans, rice, livestock, nuts, poultry, tobacco, wool and other products brought together 3.6 million farmers. Their marketing activities covered nearly \$8,000 million worth of commodities. Co-operative purchasing of farm supplies—feed, seed, fertilizer, and other essentials—affected a membership of 2,260,000 farmers. The total business of these farm supply co-operatives was about \$1,500 million.

Near the close of the year the U.S. congress changed the tax laws affecting co-operatives, virtually eliminating the exemption of farmer-owned co-operatives from federal income tax. This placed all co-operatives on an even footing with other types of business enterprise as far as the tax laws were concerned. (W. J. CL.)

CORN: *see* GRAIN CROPS.

COSMETICS: *see* SOAP, PERFUMERY AND COSMETICS.

COSTA RICA. Central American republic lying between Nicaragua and Panama. Area: 19,238 sq.mi. Pop. (1950 census, prel. fig.): 794,000, classified as about 80% white, 16% mixed, 3% Negro and less than 1% Indian. Language: Spanish. Religion: predominantly Roman Catholic. Chief towns (pop., 1949 est.): San José (cap., 79,694); Guadalupe (15,966); Limón (12,666); Puntarenas (12,329). President, Otilio Ulate Blanco.

History. Some progress toward stability and constitutional government was discernible during the year. A major milestone in the return to domestic peace, following the civil war of 1948, was passed on March 4 when *La Tribuna* of San José resumed its daily publication after three years of suspension. A foe of President Ulate, *La Tribuna* continued to criticize him. The administration announced on April 4 that it had frustrated another plot to unseat Ulate. The aborted *coup*, the government said, was directed by former President Rafael Angel Calderón Guardia (1940-1949) from his Mexican exile. Quantities of arms and munitions were seized and 48 persons were imprisoned in connection with the affair. On July 12 a court order dissolved four allegedly Communist-dominated trade unions charged with engaging in political activities outside their labour functions. Acting as President Harry S. Truman's personal representative, Edward G. Miller, Jr., assistant secretary of state, in September conferred the U.S. Legion of Merit award on President Ulate for his "exceptionally meritorious conduct" in governing Costa Rica democratically. (G. I. B.)

Education. Schools (1951): public and private primary 1,139, teachers 4,821, pupils 116,157; secondary, public 8, private 16, technical 7. The University of Costa Rica had 907 students in 1945.

Agriculture. Coffee production in the 1949-50 season was 386,449 bags (132 lb. each) including 317,600 bags exported. The 1950-51 crop totalled 335,332 bags. Exports of other crops in 1950 included: bananas 10,198,042 stems (9,244,409 went to the U.S.); cacao 48,028 short tons and abaca 2,896 tons. The 1950 census showed 610,757 cattle. In 1950, 49,449 short tons of fresh frozen tuna were exported.

Foreign Trade. Exports in 1950 amounted to U.S. \$34,689,235, imports \$46,032,968. Chief exports: coffee (51%), bananas (30%), cacao (6%) and abaca (4%). Leading customers: U.S. (71%), the Netherlands (8%), Italy (6%) and Canada (4%). Leading suppliers: U.S. (67%), U.K. (5%), Canada (5%) and Germany (4%). Important imports included textiles, machinery, instruments and vehicles, wheat flour and fertilizers.

Transport and Communications. Railways: public 410 mi., private 250 mi. Roads (1948): 1,015 mi. including 926 mi. all-weather roads. Registered motor vehicles (Jan. 1, 1951): cars 4,645, lorries 2,308, buses 810.

Finance. Revenue (1950) was 137,987,150 colones, expenditure 126,129,039 colones, thus leaving a record surplus of 11,858,111 colones. Public debt (Dec. 31, 1950): 403,504,340 colones, of which 161,007,368 colones represented the external debt. Currency circulation (July 31, 1951) 97,900,000 colones; commercial deposits 113,500,000 colones; gold reserves U.S. \$2,040,000. Monetary unit: *colón* valued officially (Sept. 1951) at U.S. cents 17·64 and on the free market at U.S. cents 13·30. (J. W. Mw.)

COST OF LIVING: *see* PRICES.

COTTON. In contrast to the previous year, trading in cotton goods in the United Kingdom during the early months of 1951 was on an active scale but conditions later deteriorated. Interest on the part of overseas consumers declined and there was a lack of confidence in the existing price level. Yarn output continued to rise slowly, production for 49 weeks totalling 1,025,680,000 lb., as compared with 997,500,000 lb. in 1950. Cloth output was also higher, the total for 11 months being 2,510,420,000 linear yards, as against 2,322,700,000 linear yards in 1950. Wastage of older workers at first exceeded recruitment but the entry of school-leavers later provided a marked change in the labour situation, available manpower exceeding 320,000, as compared with about 312,000 at the end of 1950.

World cotton supply problems were again formidable,

mainly as a result of the small 1950-51 United States crop. This barely exceeded 10 million bales and caused a pronounced shortage. The position was reversed in the new crop, originally estimated at 17,266,000 bales, but later reduced by 1,500,000 bales.

The British Raw Cotton commission continued to function throughout the year. Standard U.S.-type cotton was sold at 47·80*d.* per lb. in January, rose to 53*d.* in April, and after being quoted at 38*d.* in September was priced at 45½*d.* in December. Long-staple Egyptian Karnak cotton increased in price from 78*d.* per lb. in January to 94*d.* in March, later being quoted at 59*d.* in September and 89*d.* in December. Egyptian Ashmouni rose from 73·80*d.* to 85·80*d.* in March but was reduced to 48*d.* in September, the latest quotation being 60*d.* per lb.

After the British general election in October talks were instituted by the new government to provide increased facilities for raw cotton merchants to obtain supplies. A committee was set up to investigate the situation, as a preliminary to any moves to reopen the Liverpool cotton market. The commission announced the introduction of cover schemes for doublers, weavers and vertical firms, in addition to the arrangements already in force for spinners and merchant converters.

More encouraging cloth shipments from Britain to overseas markets were recorded. For the first 11 months of 1951 exports of cotton piece goods amounted to 812,912,000 sq. yd., as against 822,375,000 sq. yd. throughout 1950. Yarn shipments for the 11 months totalled 61,709,300 lb., as against 70,974,500 lb. for the previous year. Commonwealth markets were the main cloth buyers, notably Australia, South Africa, British West Africa, Malaya, Pakistan and New Zealand. Australia, Norway, Denmark and the Irish republic were the chief consumers of yarn.

From the beginning of 1951, British cotton spinning and weaving operatives obtained a wage advance of 10%. A further claim for a Christmas bonus resulted in a compromise agreement providing for an increase of 5% from the beginning of September and a lump sum bonus, representing 5% of earnings for the first eight months of the year, to be paid in December. In November employers and unions in the textile finishing trades reached an agreement basing future wage adjustments on the official retail cost of living index. The cotton trade unions also re-applied for a longer holiday with pay, a claim considered by the Industrial Disputes tribunal in December.

The system of issuing buying and selling permits to producers every few months was discontinued from September. The Board of Trade introduced a flexible scheme providing spinners with licences limiting their order books to 40 weeks' production ahead. Doublers and weavers simultaneously obtained licences to acquire yarn up to 40 weeks' estimated consumption.

Business in home trade goods centred on industrial fabrics; the market for domestic cloths was quiet. Sustained consumer resistance was experienced but renewed government contracts kept machinery busy. Fresh efforts were made to introduce more flexibility into the utility clothing programme. British spinners and manufacturers maintained their strong financial position, although the failure of demand to broaden in the later months of the year caused doubts to be expressed as to the future outlook.

(F. W. TA.)

United States. Manufacture. The cotton manufacturing industry experienced reduced activity during the latter eight or nine months of 1951. Heavy demand resulting from military requirements and "scare buying" following the outbreak of the Korean war carried over into early 1951, but before mid-year manufacture declined. The pricing problems of the

industry were complicated not only by surplus in stock but also by wide and unexpected swings in raw cotton prices. Mill activity dropped to about 60% of capacity. Spinning, which operated in January at 145.9% of capacity, had declined to 124.1% in October. Of 23,182,000 spindles in place, 20,294,000 were actively consuming cotton in November, as compared with 20,900,000 in February. Cotton goods produced up to end-Sept. totalled 7,770,093,000 yd.; it was estimated that the total for the year would be about 9,750 million yd., as compared with 9,887,344,000 yd. in 1950.

Production. Though the early promise of a very abundant cotton harvest gradually faded as the season progressed, the U.S. cotton crop of 1951 was a large one of 15,290,000 bales (of 500 lb. gross weight), as compared with only 10,012,000 bales in 1950 and an average for 1940-49 of 12,030,000 bales. On Sept. 1, when 2,014,444 bales of the crop were reported as already picked and ginned, a total crop of 17,291,000 bales was forecast; in October this was dropped to 16,831,000 bales, in November to 15,771,000 bales and in December to 15,290,000 bales. The acreage cotton actually harvested in 1951 was estimated at 26,698,000 ac., as compared with only 17,843,000 ac. in 1950 and an average for the previous decade of 21,622,000 ac.

Cotton prices fluctuated sharply during 1951, but were lower and more stable than world prices. Early in the year prices received by farmers were as high as 43.17 cents a lb. but, after a ceiling was placed on cotton at about 45.76 cents a lb., prices declined substantially during the summer on the prospect of a big crop, only to rise abruptly as crop estimates declined late in the season after part of the crop had been sold to producers. The average season price received by farmers was estimated at 37.6 cents (40.07 cents in 1950).

Cotton exports from the U.S. in 1950-51 were 4,117,000 bales; there was some preliminary indication that as many as 6 million bales might be exported in 1951-52. Thus, in summary, a supply consisting of a carry-over from the previous crop of 2.2 million bales, plus a new crop of nearly 15.3 million bales, would support a domestic consumption of at least 9.5 million bales, which would mean that exports must be held below the earlier estimate (6 million bales) if the carry-over on Aug. 1, 1952, was not to fall below the very low one of 1951. In consequence of the probable tight situation, the official goal recommended for the 1952 crop was 16 million bales and 28 million ac. in cotton cultivation on July 1, 1952. Export controls had not been reimposed by the end of 1951.

World Production. Early indications pointed to a 23% increase in world cotton production in 1951-52, as compared with 1950-51, or 33.8 million bales as compared with 27.6 million bales. (See also *TEXTILE INDUSTRY.*) (J. K. R.)

COUNCIL FOR MUTUAL ECONOMIC AID.

No official information was published during the year on the activities of the Council for Mutual Economic Aid (C.M.E.A.) or *Soviet Ekonomicheskoy Vzaïmopomoshchi*, the inception of which was announced in Moscow on Jan. 25, 1949, and of which Anastas Ivanovich Mikoyan, member of the Politburo of the All-Union Communist party and deputy premier of the U.S.S.R., who on March 4, 1949, was released from his duties as minister of foreign trade, was reputedly controller.

Conceived as a Soviet reply to the Organization for European Economic Co-operation, C.M.E.A. had the task of co-ordinating the long-term plans of industrialization of the U.S.S.R.'s European satellite states with Soviet grand strategy. The first official announcement stated that the C.M.E.A., which would make decisions only with the consent of the country concerned, was to organize the interchange of economic experience, of technical assistance and of help with

regard to raw materials, foodstuffs, machinery and equipment. It was an organization which might be joined by other countries of Europe sharing its principles and desiring to participate in broad economic co-operation with the six founder countries, Bulgaria, Czechoslovakia, Hungary, Poland, Rumania and the U.S.S.R. On Feb. 22, 1949, it was announced that Albania had been admitted to the C.M.E.A. and admission of the German Democratic (Eastern) republic was announced on Oct. 1, 1950.

The council was said to be composed of representatives of the member countries on the basis of equal representation. Although no names were published, it was most likely that the respective countries were represented by the chairman of their State Planning commission and the minister of foreign trade. (See also *EASTERN EUROPEAN ECONOMIC PLANNING.*)

COUNCIL OF EUROPE. The story of the council with its headquarters in the House of Europe at Strasbourg during 1951 might be summed up as a gradual process of gearing the hope for European union to existing realities. Thus, whereas in 1949 and 1950 the pioneers had embraced the notion of a European parliament, of which the consultative assembly should be the principal organ of democratic control and initiative and the committee of ministers a sort of upper house exercising the power of veto, in 1951 it was a question, rather, of developing a tolerable régime of co-existence of the council's two organs. Dirk Stikker, of the Netherlands, chairman in office of the committee of ministers, when delivering the latter's report to the assembly in May, reminded his hearers that the growth of parliamentary democracy in the several countries had itself been marked by the inter-play of the two elements of a charter (*cf.* the statute of the council) and unwritten parliamentary procedure.

After some 18 months' trial many among the representatives to the assembly felt that that statute was overweighted on the side of caution, that something more robust and revolutionary was needed. The protocol for the amendment of the statute, designed to confer on the council law-making powers, was duly elaborated by the committee of seven appointed by the assembly and then, together with sundry other proposals originating in the 1950 assembly, had to run the gauntlet of the committee of senior officials which had been set up by the committee of ministers at its Rome session in Nov. 1950.

This committee of ministers' advisers, as it came to be known, submitted the proposed changes in the statute to a thorough examination. While rejecting outright any alteration in the fundamental principles agreed upon by the ten founder-governments in May 1949, the advisers recommended for adoption certain modifications designed to improve the working of the machine. At its eighth session (May 2-4), the committee of ministers accepted these recommendations and a number of amendments were introduced—not, however, by formal process of protocol, which would have meant reference back to the national governments and parliaments, but, with the authority of the statute itself, through unanimous resolution backed by a certificate of the secretary general. These amendments, mainly, gave sanction to what had become established practice. But there was, too, a significant shift of emphasis in the rewording of article 25 of the statute so as to place the responsibility for election of representatives to the assembly on parliaments and not governments. This was in accordance with established dogma on the Continent, where parliament is the embodiment of the sovereign will of the people: to such a breach with the tradition of government delegation in international conferences the British government had, in 1949, shown itself resolutely opposed.

Certain texts were also agreed, *qua* decisions, by the committee of ministers at its eighth and ninth sessions, by way of declaration of intention, with a view to their ultimate inclusion in a revised statute. One of these decisions which gave particular satisfaction to the zealots of the assembly was the authorizing of partial agreements. Thereby, while the hallowed principle of unanimous decisions underlying the whole conception of inter-governmental co-operation was safeguarded, a member of the committee of ministers was enabled to stand aside, that is to abstain from voting in the knowledge that his government would not be bound by a decision on which other governments were agreed.

The May meeting of the committee of ministers, held on the eve of the third ordinary session of the consultative assembly, was notable for the unanimous accord given, after due consultations with the standing committee, to the promotion of Western Germany to the status of full member. (The Saar remained as the sole associate member of the council.)

While the ministers took note of the special protocol for liaison with the Council of Europe signed on April 18 by the six member nations simultaneously with the treaty establishing a coal and steel community, they were not called upon at this point to go beyond the approval in principle, already accorded at the Rome session, of the policy of establishing specialized authorities with competence and powers in particular fields, which had emerged from the assembly's debates in 1950 as the road along which all could travel. The federalists had been routed and this functional approach to European union was henceforth the Strasbourg gospel—though interpreted by some, it is true, as "federation, sector by sector." Incidentally, among the texts designed for later inclusion in a revised statute, was a whole new chapter on the question of specialized authorities.

Among the recommendations sent forward from the third session of the assembly (first part, May 5-15) to the committee of ministers were a draft convention for the establishment of a European Refugees office; proposals for the establishment of a European manpower board and for safeguarding social security benefits for migrant workers; and a statement welcoming the agreed submission of an Organization for European Economic Co-operation (O.E.E.C.) progress report to each ordinary session of the assembly.

The high light of the proceedings in May was the proposal standing in the name of Paul Reynaud, former prime minister of France, to organize a joint discussion on common problems of the west between representatives of the assembly and representatives of the two houses of the U.S. congress. Encouragement for this move had been given, as it happened, by a resolution of the committee of ministers of March 17 in favour of close liaison between existing European organizations and the countries of north America. In the event the recommendation adopted by the assembly omitted all reference to Canada, for the good reason that the latter, together with other Commonwealth countries, had already, during the second session, received an invitation from the assembly to send observers to attend its debates.

What was now suggested was a new departure, outside the ambit of the assembly proper. The great value of it was that it signified a recognition on the "parliamentary" plane, on a par with the establishment of the North Atlantic Treaty organization at governmental level, that Europe by itself, still more western Europe, was not a significant grouping in the world of today and also that the union of Europe was to be seen no longer as an end in itself, let alone an idealist's pipe-dream, but as an essential and integral part of the process of building up the Atlantic community to which the western world was now dedicated. Political and economic

issues, like the proposal for a European army, the manifold activities of the O.E.E.C., the new U.S. appropriations to aid European rearmament and major social problems such as those of refugees and surplus populations—all these were questions of common concern on both sides of the Atlantic; and it was fitting that the representatives of public opinion, no less than governments, should take counsel together, in the interests of an effective partnership. Moreover, duplication of effort was to be avoided wherever possible: the committee of ministers, for example, set aside the recommendation from the 1950 assembly for establishment of a raw material resources and purchasing board on the ground that the international aspects of this particular problem were under examination by a special organization set up for that purpose in Washington, while its specifically European elements were being studied by a committee of the O.E.E.C.

Lord Layton, a vice president of the Strasbourg assembly, went to Washington immediately after the first part of the third session of the assembly for a preliminary reconnaissance, and he reported that the idea of a joint discussion was welcomed by influential members of the U.S. congress. A small party including Paul-Henri Spaak, president of the consultative assembly and the secretary general, proceeded to Washington in September to make the necessary arrangements, and a five days' debate took place in Strasbourg, starting on Nov. 19, just a week before the date fixed for the reconvening of the assembly, with a team of 14 (7 senators, 7 representatives) from the U.S. and a score of representatives of the consultative assembly.

At its ninth session, on Aug. 3, 1951, the committee of ministers adopted the text of a protocol to the convention on human rights, relating specifically to the right to own property, the right to education and right to freedom of electoral process, questions on which agreement had been more difficult to reach and which were now to be added to the corpus of rights whose collective enforcement would be ensured.

On the refugees question the committee considered that the time was not ripe for the calling of the European conference requested by the assembly, so consideration of the assembly's recommendation for a refugees office was for the time being deferred (as also that proposing a European manpower board): the ministers recommended that the committee of experts that had been tackling this question should hold a further meeting which should be attended by representatives of the U.S. government and of the International Bank for Reconstruction and Development. The suggestion that a committee on population and refugees should be formed as one of the assembly committees was commended.

The agenda for the second part of the third session of the assembly included, among the topics for debate, a number of hardy annuals, with emphasis still on the projects for specialized authorities on the pattern of the Schuman plan. Further exchanges took place on the question of European federation. A more down-to-earth question was whether the council might take over the remaining functions of the Brussels Treaty organization and the work of O.E.E.C., which was originally intended to be completed by 1952. Could and should the consultative assembly exercise a sort of democratic control over governments and civil servants working on these common problems? The answer would depend, it was appreciated, to no small extent on the degree to which the Strasbourg organization could claim to speak for the whole of "free Europe," more precisely on the extent to which the new British government would be prepared to depart from its attitude of detachment from the enterprise of establishing a "European authority with limited functions but real powers." The fate of the proposal for

a continental federation (within the Atlantic community) foreshadowed in statements by Robert Schuman, the French foreign minister—that is, for a political authority as a counterpart to the high authority envisaged for the European Coal and Steel pool (*q.v.*) and to direct the employment of a European army—was thus likely to be the crucial test of the council's continuing vitality. (W. H. CTR.)

COUNCIL OF FOREIGN MINISTERS. No meeting of the Council of Foreign Ministers—the four-power body set up at the Potsdam conference in 1945 for the preparation of European peace treaties—took place in 1951, but representatives of the United States, Great Britain, France and the Soviet Union met on March 5, 1951, in Paris to draw up an agenda for a meeting of the Council of Foreign Ministers that was thereafter to be held in Washington. The delegations were led by Philip Jessup (ambassador-at-large, U.S.), Ernest Davies (parliamentary under secretary for foreign affairs, Great Britain), Alexandre Parodi (secretary general of the Foreign Ministry, France) and Andrey Gromyko (deputy foreign minister, U.S.S.R.). The attempt to agree on an agenda failed and, after 74 sessions, the conference broke down on June 21.

The conference arose out of a Soviet request, set out in notes to the three western powers on Nov. 3, 1950, for a meeting of the Council of Foreign Ministers to discuss the demilitarization of Germany. The three western powers replied on Dec. 22 that a four-power meeting should discuss not only the question of Germany but “the elimination of the causes of the present international tension throughout the world.”

In further exchanges of notes this difference on proposed subjects of negotiation was sufficiently narrowed down to make the attempt to fix a definite agenda appear worthwhile. The Paris conference was called for this purpose.

At the beginning of the conference, the chief difference between the Soviet Union and the three western powers, which throughout maintained a joint position, turned on the question whether the demilitarization of Germany or the causes of the present tension should be put at the head of the agenda. A subsidiary difference arose out of the wish of the three western powers to have the completion of the Austrian treaty put on the agenda, whereas the Soviet Union was unwilling to discuss the Austrian treaty except coupled with the question of Trieste.

Towards the end of March a compromise on these questions seemed in sight. It consisted in a proposal to head the agenda with a general item “causes of international tension,” including, in a prominent position, the demilitarization of Germany. But, when agreeing to this compromise, the Soviet Union demanded simultaneously to include as a new item on the agenda the North Atlantic treaty and the establishment of the U.S. bases in Europe and the middle east.

This the three western powers refused on the ground that the North Atlantic treaty, a treaty concluded by 12 powers for the purpose of their common defence, and to which the U.S.S.R. was not a party, did not come within the competence of the Council of Foreign Ministers and could not be called into question by making it the subject of negotiations with the Soviet Union.

On the Soviet insistence to include the North Atlantic treaty in the agenda, and the western refusal to do so, the conference finally broke down after a deadlock of almost three months, during which the western powers submitted three separate agendas for Soviet choice, including a “split” agenda listing both agreed and disagreed items and leaving the latter for the final decision of the foreign ministers themselves. There was also a new recourse to a direct exchange

The deputies of the Council of Foreign Ministers who met in Paris, March 5-June 21, 1951. Left to right, Ernest Davies (Great Britain), Philip Jessup (United States), Andrey Gromyko (U.S.S.R.) and Alexandre Parodi (France).

of notes between the foreign ministries, and a date for the meeting of the Council of Foreign Ministers was actually proposed by the western powers (July 23 at Washington), but all to no purpose. Finding the Soviet Union adamant in its insistence on including the North Atlantic treaty in the agenda, the western powers declared on June 21, through the British representative, that the invitation to Washington remained open, but that a continuation of the present discussion had no practical utility.

The surprising Soviet behaviour of first taking the initiative to bring about a conference on German demilitarization, and then allowing the project to fail over a quite different question, was widely explained by developments outside the Paris conference. In the autumn of 1950 preliminary steps had been taken by the western powers towards rearming German units as a contribution to western European defence and the Russians were believed to be genuinely anxious to prevent this “German rearmament”; in the early spring of 1951 this question had been shelved and, in the opinion of many diplomatic observers, the Soviet interest in a four-power conference had therewith lapsed. From the beginning of April, when it had become clear that there would be no German contribution to western defence in the immediate future, the original Soviet motive for demanding a four-power conference had, in the opinion of these observers, lost its force, and the Soviet Union was no longer interested in a meeting of the Council of Foreign Ministers for the purpose of actual negotiation, but only for propaganda purposes. These would have been served if the western powers had been prepared to be put in the dock for making defence preparations among themselves in the framework of the North Atlantic treaty; but they were not so prepared. The ensuing breakdown of the Paris conference was widely interpreted as proof that the time was not yet ripe for a genuine diplomatic settlement of the outstanding European issues between the West and the Soviet Union. COUNTRIES OF THE WORLD, AREAS AND POPULATIONS OF THE: *see* AREAS AND POPULATIONS OF THE COUNTRIES OF THE WORLD.

COUNTRY LIFE. To the townsman visiting the country in the summer of 1951, England was never more beautiful. The rain and the cold of winter, which had lingered so long, had held the flowers in bud past their due season so that, when at last they were warmed by the sun, they blazed forth with

a rich profusion. The May flower alone was too delicate to resist the long winter, and responded but fitfully to the belated sun.

However, the rains that brought this beauty gave more than the usual seasonal troubles to British farmers. The year 1950 had been remarkable enough for persistent rains, but the early months of 1951 produced weather that justified the most gloomy forebodings. The fields were sodden and lifeless right into May. It was widely believed that the corn, so long under water, would be unable to germinate, although this fear fortunately proved to be largely unjustified.

But the sun always returns to earth, and in May all the little green things of the countryside suddenly leapt into life. Hedges which a day or two before had seemed cold and dead, now seemed to breathe and whisper with life. Within a fortnight the whole farming scene changed, and countrymen said that they could "see" the grass growing.

In early June every farmer who had ley fields to mow—and by 1951 these probably constituted the majority of British farmers—was busy haymaking. Summer rains were frequent, but the farmers who watched their chance could snatch in their hay between the showers. Their cut was certainly more successful than in 1950, so that it was expected that there would be no further talk of importing hay from Norway. Those who delayed haymaking until July were unfortunate, for in that month the showers were more persistent, and there were also periods of heavy rain. Not a few cuts of July hay were left to rot in the fields, and fears for the grain harvest became widespread.

Whatever the effect of the wet season on the fields, there were sufficient spells of fine weather to enable the country towns and villages to celebrate the Festival of Britain with enthusiasm. Many old implements were dragged from barns to illustrate agricultural progress since 1851. As the farmer examined these ancient tools, he might well have wondered if the horse plough was not destined soon to follow the mediaeval ox plough into oblivion.

August, the harvest month, came and went in persistent rain. Little corn could be gathered in, except by the combine harvester in the drier districts. In dealing with a corn crop that is liable to be soaked at any time, the combine has an enormous advantage over the reaper and binder, which in 1951 was still the implement most used in Great Britain. A day's fine weather, when the corn is ripe, is enough to enable it to be harvested by the combine, even though, in most cases, it is still necessary subsequently to dry it artificially. This season and the previous one convinced most farmers that an artificial drying system is a necessity when a combine harvester is purchased.

September was the vital month for British farming. As the rain-filled days followed each other it became evident that, if the harvest was to be gathered at all, it would be the latest in living memory. When the middle of the month passed without relief, the farmers looked at the soaked and damaged corn-fields in despair. Fortunately, the reprieve came just in time. In the third week of September the rain ceased, and farmers took heart. News came from every county that farmers, working from dawn to dark, were carrying in their harvest. Cornwall and Devon, both of which suffered so much in 1950, saved about three-quarters of their corn crops. The eastern counties suffered hardly at all.

The rain ceased in September just in time to save the farmer from disaster. The beautiful autumn which followed allowed a fair harvest of potatoes and sugar beet to be gathered in, and restored a certain amount of optimism to the farmer's outlook. Farmers throughout the land who had been saved from disaster at the last moment were especially sincere in their Harvest Thanksgiving. (See also AGRICULTURE; BEE-

KEEPING; FIELD SPORTS; ORNITHOLOGY; WILD LIFE CONSERVATION.) (G. Wl.)

CRICKET. In the winter of 1950-51, an M.C.C. team visited Australia and New Zealand and a Commonwealth side toured India, Pakistan and Ceylon. The former had the satisfaction of winning a test match in Australia for the first time since Dec. 1936, and though this was only achieved in the last of the five matches, it was generally agreed that the difference between the two sides was not really as great as these figures would suggest. As so often happens at Brisbane, rain determined the result of the first match; after A. V. Bedser and T. E. Bailey had bowled splendidly to dismiss Australia on a good wicket for 228, there was a blank second day, and on the third the wicket was so difficult that it reduced batting almost to a farce. F. R. Brown, the M.C.C. captain, declared at 68 for 7 wickets, A. L. Hassett followed suit at 32 for 7, and before the close of play England, in pursuit of the 193 required to win, had lost 6 wickets for 30. Although L. Hutton made a superb 62 not out on the last day, Australia won by 70 runs. The second game, at Melbourne, was a splendid fight, with the bowlers always on top; Brown played a courageous innings of 62 to give his side a lead of 3 runs over Australia's 197 and then, with 4 wickets for 26, played a major part in dismissing them for 181; but only Hutton (40) showed any signs of mastering the accurate and aggressive bowling and Australia won by 28.

At Sydney, England's fate was sealed in the third test by an innings and 13 runs, and K. R. Miller and J. Iverson

F. R. Brown, captain of England, catching Keith Miller in the fifth test match at Melbourne, Feb. 1951. England won the test by 8 wickets. Keeping wicket is T. G. Evans.

The Warwickshire team which won the 1951 county championship. Back row (left to right) D. Taylor, R. T. Weeks, T. L. Pritchard, A. Townsend, R. G. Thompson, F. C. Gardner, and R. E. Hitchcock. Front row, A. V. Wolton, W. E. Hollies, H. E. Dollery (captain), J. S. Ord, C. W. Grove and R. T. Spooner.

dominated the game. After taking 4 wickets for 37 in England's first innings of 290, Miller, in an uncharacteristically dour innings, contributed 145 not out to Australia's total of 426, and then Iverson's accurately controlled spin brought him 6 wickets for 27 in an unworthy last M.C.C. innings of 122. Once again, only Brown and Hutton found any real batting form.

The fourth test at Adelaide brought Australia another decisive victory, by 274. For her total of 371 she owed almost everything to A. R. Morris (206), but England's first innings of 272 was even more dominated by Hutton who, going in first, was still undefeated after six hours for 156. In Australia's second innings Miller made 99 and the young J. Burke had the distinction of scoring 101 in his first test match.

In the last test, at Melbourne, England's victory by 8 wickets was virtually the work of three men. With a match record of 10 wickets for 105 runs, A. V. Bedser crowned a tour of great endeavour and brought his test match figures to 30 wickets for 16 runs apiece; Hutton, with 79 and 60 not out, was once again at his masterly best; but it was R. T. Simpson's 156 not out in the first innings that really laid the foundations of success.

This victory was widely acclaimed as an overdue reward for a team who, thanks largely to Brown's leadership and personal example, had fought gallantly and made many friends; but, though the bowlers had done more than was expected of them, D. C. S. Compton's complete lack of form in the tests and the failure of the young batsmen with whom the M.C.C. selection committee had understandably taken a chance, weighted the scales too heavily against them, even though Australia, with Sir Donald Bradman no longer there to dominate the scene, seemed at times little more than a shadow of the side that had swept victoriously through England in 1948.

On the short New Zealand tour that followed two test matches were played: the first was virtually confined to one innings by each side—New Zealand 417 for 8 declared,

M.C.C. 550—but the M.C.C. won the second by six wickets, largely owing to the bowling of R. Tattersall who had been flown out to Australia a month earlier. Throughout the tour, the rate of scoring by both sides in the test matches had been sadly low and before the end there were signs that public interest and support were beginning to be affected by it.

The tour of the strong Commonwealth side in the Indian peninsula was a great success, as many as 40,000 spectators watching the opening day of the second of the so-called "test" matches. Of these five games the visitors won the only two that were completed. The West Indian F. M. Worrell batted brilliantly throughout the tour and his compatriot S. Ramadhin was the most successful bowler, though receiving strong support from the Australian spinners G. Tribe and B. Dooland. Of the Indians, V. S. Hazare scored heavily, V. Mankad bowled with great accuracy and D. G. Phadkar showed good all-round form.

The chief feature of the English season of 1951 was the visit of a South African team under the captaincy of A. D. Nourse. With more than half its members very young and without any experience of English conditions the side was further handicapped by a very cold and wet May and made an inauspicious start. The tourists' win in the first test match at Nottingham created, therefore, a great sensation. The man responsible for this victory was Nourse who, braving the pain of a broken thumb which had been only recently reset, batted for over nine hours for 208 out of a total of 483 for 9, when he declared. After Simpson and Compton had both made centuries, Brown also declared with England still 64 behind: then Bedser and Tattersall, on a wicket that was taking spin, dismissed South Africa for 121, leaving England 186 to win. Thanks to splendidly accurate bowling by A. M. B. Rowan and N. B. F. Mann, and the astute and aggressive captaincy of E. A. B. Rowan, who had taken over from the injured Nourse, it proved 72 too many, but a heavy responsibility lies with the English batsmen who, except for Wardle, made no attempt to counter-attack and perished ingloriously.

In the second game, at Lord's, fate dealt roughly with the visitors, for after they had done well enough to dismiss England for 311, heavy rain on the next day produced a wicket on which they could find no effective answer to Tattersall's accuracy and spin. Only a spirited stand of nearly 100 by G. M. Fullerton and J. E. Cheetham saved them from defeat before the second nightfall. As it was, England won by 10 wickets.

If this match was Tattersall's—his final figures were 12 for 101—the third at Old Trafford, Manchester, was Bedser's with 12 for 112. On a wicket that always gave the bowlers help, E. A. B. Rowan's 57 in South Africa's second innings was the highest score on either side until, on the last morning, Hutton (98 not out) piloted England comfortably home by 9 wickets. Once again South Africa had had the worst of conditions with which their team were still unfamiliar.

At Leeds, in the fourth test South Africa found a true and fast wicket and never looked like being beaten, but the tempo of their batting never threatened England with serious risk of defeat. In making 236 in 9½ hours, E. A. B. Rowan beat the South African test match record and their total reached 538 against some very poor bowling. To England's reply of 505 Hutton contributed 100 and P. B. H. May a most impressive 138 in his first test match innings. At the end of the fourth day South Africa were 87 for no wicket, E. Rowan again 60 not out, but then came rain and there was no more play.

The fifth match at the Oval, was played throughout on a pitch that, though reasonably fast, helped the spin bowlers and so produced a fascinating game with the balance between bat and ball very even. Once again the inability of the batsmen on either side to break through an accurate attack, supported by a close field, was apparent. In the end England were set 164 to win; Hutton looked like carrying the side serenely home when he made cricket history by being given out, "obstructing the field," and with 4 wickets down for 90 the game was open; but Brown, after a perilous start, made 40 brave runs and England won by four wickets.

1951 COUNTY CHAMPIONSHIP FINAL PLACINGS

Points Awarded	P.	W.	L.	D.	First Innings lead in match		Pts.

NOTTINGHAMSHIRE	28	1	11	13	3	0	40

The Essex and Sussex records include two points for a tie on first innings in match drawn.

In the county championship, Warwickshire had a decisive and popular victory exactly 40 years after their only previous success. Their team, which had a slightly cosmopolitan flavour, were fortunate in having to meet no calls for the test matches, but they were a well-balanced side admirably led by their professional captain, H. E. Dollery, who had a way of making runs just when they were most needed. T. L. Pritchard and C. W. Grove bowled with great persistency and W. E. Hollies' spin was invaluable. R. T. Spooner had a very good season both as a wicket-keeper and batsman and the side included some young players of promise. There

was great enthusiasm for the game in the county. The runners-up were Yorkshire, for whom (apart from Hutton) F. A. Lawson and J. V. Wilson batted very well and A. R. Appleyard achieved the notable record of 200 wickets in his second county season. Lancashire, after threatening to challenge, fell away in August. J. D. Robertson (Middlesex) was the most consistent batsman of the season, scoring nearly 3,000 runs; but for the first time within living memory no-one achieved "the double" of 1,000 runs and 100 wickets.

As in 1950, the Gentlemen and Players match produced some most interesting cricket and in the end the amateurs, set by the Players' declaration to get 249 in well under 3 hours, only failed by 21. Batting honours went to Compton (150 and 74 not out) and to May who made 119 not out in his first innings in this historic match.

Oxford university upset all expectations by defeating a much heralded Cambridge side by 19 runs less than 20 minutes from time. They owed much to B. Boobyer (80) and D. B. Carr (50) who carried them in their second innings, more still to R. V. Divecha who bowled most accurately to take 7 for 62 in the final stage of the match and perhaps most of all to the leadership of their captain M. B. Hofmeyr and the magnificent fielding of the side. Cambridge paid the penalty of trying to win by "safety-first" methods.

Eton college, after completely outplaying Harrow school until tea time on the second day, were in the end just foiled, chiefly by the stubbornness of W. J. Nokes, but in A. C. D. Ingleby-Mackenzie and R. V. C. Robins they had two boy cricketers of the highest promise. The latter took 13 for 91 against Harrow; the former scored 81 and 52, and in the following month, with scores of 67 and 58, played the leading part in the victory of a highly promising Public Schools XI against the Combined Services at Lord's.

In December the M.C.C. announced the constitution of the M.C.C. Youth Cricket association, to come into being on Jan. 1, 1952. H. S. Altham, M.C.C. treasurer, would be chairman, Sir W. A. Worsley (Yorkshire C.C.C.) vice chairman and Vice Admiral E. G. N. Rushbrooke secretary and treasurer.

(H. S. A.)

CRIME. International. Two important international congresses were held in Europe in 1950: the 12th International Penal and Penitentiary congress which met from Aug. 14 to Aug. 19 at The Hague and the second International Congress of Criminology held from Sept. 10 to Sept. 19 in Paris. While the former (which was to be the last of its kind) was mainly devoted to penological matters, the Paris congress had as its main topic the study of the various causes of crime. One of the most important results of the congress was the revival of the International Society of Criminology which, founded in Rome in 1938, had so far been hampered in its development by World War II.

Great Britain. England and Wales. In 1950 the number of persons found guilty of offences of all kinds was 688,650, of whom 116,021 had committed indictable offences, 564,844 non-indictable offences and 7,785 offences against the defence regulations, an increase of 1,727 and 41,281 and a decline of 4,855 respectively against the figures for 1949.

Among the indictable offences which contributed to the increase were violence against the person (16%), sexual offences (5%), thefts of motor vehicles (32%), and thefts from automatic machines and meters (26%). The number of murderers of persons aged one year and over rose from 95 to 109, the total number of victims from 114 to 122. Seventy-one persons were arrested in murder cases involving 72 victims. Four of those arrested were discharged, 14 found unfit to plead, 15 found guilty but insane, 2 certified insane after conviction and 9 acquitted; 14 were executed and the rest sent to prison or other institutions. Thirty-eight murderers

or suspects committed suicide before arrest. Suicides declined from 4,653 to 4,324, attempted suicides from 4,686 to 4,676.

The number of persons found guilty of traffic offences, accounting for 63% of all non-indictable offences, increased from 320,182 to 357,932, and the fines paid by motorists from £392,905 to £492,038. Of those found guilty of indictable offences, 100,948 were males and 15,073 females; 23% were under 14 years old, 14% between 14 and 17, 11% between 17 and 21, 21% between 21 and 30, and 31% were 30 and over. The number of individuals responsible for those 116,021 indictable offences was 109,911.

Indictable offences known to the police increased from 459,869 in 1949 to 461,435 in 1950. The percentage of indictable offences cleared up remained 47.

Of the two royal commissions already referred to (see *Britannica Book of the Year 1951*) one, the Royal Commission on Betting, Lotteries and Gaming, published its report in 1951. The report reached the conclusion that gambling was of no significance as a direct cause of serious crime and, at least at present, of little importance as a direct cause of less serious offences involving dishonesty. It recommended that the law relating to betting, gaming and lotteries should be consolidated and all existing statutes other than the Racecourse act, 1928, and the Betting and Lotteries act, 1934, be repealed; and that the placing of bets at licensed betting offices should, with proper safeguards, be made legal. It took the view that no important advantage was to be gained by the establishment of a national lottery. (See also BETTING AND GAMBLING.)

In the Metropolitan Police district the number of indictable offences known to the police showed a decline from 106,077 in 1949 to 100,304 in 1950; *i.e.*, 11.9 against 12.6 per thousand inhabitants. This decline was confined to persons under 14 and between 21 and 40; for the age group 17-20 there was an increase of 9.1%. However, offences against the person, including sexual offences, increased by 7.1%. Robbery and assault with intent to rob declined by 11.7% from 290 to 256 cases. The percentage of indictable offences cleared up was 32.4 against 31.3 in 1949. Of the 26,862 persons arrested for such offences 39% had previous criminal records.

Scotland. The number of persons against whom a crime or an offence was proved was 96,271 in 1950 as against 92,778 in 1949, an increase of 3.8%. 91.7% of them were males, as compared with 90.9% in 1949. The highest incidence was again in the 17-20 age group for males and in the 30-39 age group for females. The total number of crimes and offences known to the police was 173,708, an increase of 11,210 or 6.9% against 1949; again 60% of them were committed in the four counties of cities. The number of crimes in these four counties was 22.5 per thousand, compared with 13.0 in the 10 large burghs with separate police forces and 8.8 in the 19 county or joint police areas. Twenty-one cases of murder were known to the police compared with 14 in 1949; of the 16 persons prosecuted 4 were acquitted or had the charge against them withdrawn and 3 were found insane and unfit for trial. Of the nine persons sentenced to death seven were reprieved.

Europe. Austria. A slight fall occurred in 1950 in the number of cases known to the police; *i.e.*, from 221,097 to 211,783. Murder and manslaughter declined from 155 to 101, but sexual offences showed a further increase from 2,691 to 2,821. Altogether, the trends of crime reflected the greater stability of conditions in Austria: robberies, which had amounted to 1,732 in 1947 and 597 in 1949, went down to 350 in 1950 and burglaries declined from 14,756 in 1947 and 6,555 in 1949 to 5,163.

France. There was a further slight fall in the total number of cases dealt with from 670,962 in 1949 to 658,047 in 1950,

and the percentage of arrests declined from 58 to 48. An increase occurred in crimes against persons from 23,550 to 26,626 (*Sûreté nationale*, 17,622 against 14,969; *Préfecture de Police*, 939 against 460; *Gendarmerie*, 8,066 against 8,121), whereas sexual crimes declined from 15,908 to 14,652 and thefts from 233,816 to 187,496.

Italy. The decline noted in 1949 was not maintained in 1950 when the number of cases brought to the notice of the police rose from 1,281,408 to 1,316,506 (crimes 709,033, offences 607,473), and the number of sexual offences from 7,377 to 8,082. (H. M.M.)

United States. For the third successive time, both urban and rural crimes increased during the first half of the year. The rise was not by any means uniform either as to areas or types of crime, but there was no mistaking the general result. The great increase of negligent manslaughters (chiefly motor vehicle homicides caused by criminal negligence) recorded in the cities during 1950 was extended into rural areas during the first six months of 1951. Motor car thefts and other larcenies also rose sharply, while robberies in both city and county showed declines. Since 1950 had likewise compared favourably with 1949 in the number of robberies recorded (an even 10% reduction for rural and urban areas combined), the tendencies for this one offence classification were definitely favourable.

CRIME CHANGES IN UNITED STATES JAN.-JUNE, 1950 AND 1951

	Percentage change	
	Cities	Rural Areas
Murder and non-negligent manslaughter	6.1	7.4
Negligent manslaughter	3.2	121.3
Rape	6.0	2.4
Robbery	8.4	21.8
Aggravated assault	1.9	9.4
Burglary	3.2	5.2
Larceny	7.9	12.9
Motor car theft	18.6	20.0
All crimes listed	5.1	4.0

Yet the total of crimes reported on a nation-wide basis continued at very high levels, with 170,000 motor car thefts, more than 1 million other larcenies, 412,000 burglaries and other crime classifications in lesser numbers. Although rural crimes continued for the most part at a substantially lower rate than was recorded for cities, the property of the average urban dweller was a special target. Thus for each 1,000 urban residents, the first half of 1951 witnessed one motor car theft, five other larcenies and two burglaries. These figures are roughly doubled when extended to an annual basis. Age distribution of offenders showed the greatest concentration between 21 and 25 years; but of the 185,406 persons arrested in 1950 for property crimes, 28.9% were under 21 years of age.

The United States senate's special committee to investigate organized crime in interstate commerce (the Kefauver committee) was widely publicized in 1950 when its public open hearings were held in various large U.S. cities. In 1951, however, the televised broadcasts of the committee's hearings, held in New York, of gamblers and politicians excited an extraordinary response from the U.S. public, whose amused tolerance soon changed to indignation. The reluctant testimony of Frank Costello of New York and Willie Minetti of New Jersey and the recall of William O'Dwyer, former mayor of New York city, from the U.S. embassy in Mexico to face a fusillade of questioning were the highlights of the investigation. Minetti was later assassinated for talking too freely. Costello was indicted for perjury and other major and minor witnesses were charged with contempt of court. (See also JUVENILE DELINQUENCY.) (BR. S.)

CUBA. Island republic in the Caribbean sea, including the island of Cuba, the Isle of Pines, and other minor islands and keys. Area of the main island: 44,217 sq.mi. (Isle of Pines, 1,180 sq.mi.). Pop.: (1943 census) 4,778,583, (mid-1951 est.) 5,400,000. Racial distribution is officially calculated at 75% white (about one-third of this group is mulatto), 24% Negro and 1% Asiatic (largely Chinese). An estimated 200,000 Spaniards live in Cuba. Language: Spanish. Religion: predominantly Roman Catholic. Havana (pop., 1949 est., 800,000) is the capital and chief port. Other chief towns (pop., 1946 est.): Santiago de Cuba (152,000); Camagüey (87,000); Pinar del Rio (64,000); Matanzas (55,000). President, Carlos Prío Socarrás.

History. Cuba's third largest sugar crop on record was harvested in 1951, reaching a total of 6,348,368 metric tons. The problem of marketing the portion not acquired by the United States continued to absorb the attention of the industry. At the end of 1951, the Cuban quota of sugar imported into the United States was slightly reduced. A study of the economy of Cuba by the International Bank for Reconstruction and Development, published in 1951, stressed the need of vigorous promotion of the export of non-sugar products, and also recommended more extensive research on the part of the sugar industry on all aspects of its operations. Among many other recommendations was one of improving the relations between labour and management, through legislation and its effective administration.

The Central bank was able, by the middle of 1951, to substitute Cuban currency for the floating supply of U.S. dollars, which, after July 1, were treated like any other foreign currency. The currency remained stable in foreign exchange markets, but prices and costs of operation went on rising. Building activity continued in nearly all the larger communities. The trade balance was modestly favourable. The treasury's holdings of foreign currency (chiefly dollars) remained high.

The budget was voted late in the year, and expenditure of about \$300 million of which debt service absorbed about \$6.5 million was estimated. A tax on dividends of 5.8% and one of 4% on corporate surpluses in excess of 30% of capital stock were established to provide a retirement fund for all national government employees. At the year's end the government announced a project of a tax of 6 c. on each 100-lb. bag of sugar to pay for the nationalization of the Havana United railways (owned by British investors), which had a costly strike during the year.

The search for oil in the coastal waters of Cuba continued throughout the year, and one well as deep as 10,000 ft. was drilled on the north coast. Activity in mining was sustained, and improvement in transportation facilities aided industry and agriculture alike.

(C. MCG.)

Education. Schools (1944-45), state, pupils 498,286; private, pupils 72,000. There were 21 institutions for advanced education and a teachers' college and a commercial school in each province. University education was available at the University of Havana, the Oriente university (Santiago de Cuba) and the Catholic University of Villanova (Havana).

Agriculture. Sugar cane, by far the most important crop, 1950-51 production 6,126,000 tons; blackstrap molasses 288,639,643 gal. Other crops (1950-51): coffee 547,000 bags of 132 lb. each; tobacco 38,000 short tons; henequen fibre 17,500 tons; rice (paddy) 143 million lb.; black beans 69 million lb.; red beans 19 million lb. Livestock: (Jan. 1, 1951) cattle 4,600,000; (July 1, 1946) pigs 1,338,000; sheep 154,000; goats 141,000.

Foreign Trade. (1950) exports \$657 million, imports \$515 million. Chief exports: sugar (85%), tobacco and products (5%) and molasses (4%). Leading customers: U.S. (59%), U.K. (15%) and Netherlands (5%). The U.S. (79%) was the leading supplier.

Transport and Communications. Railways (1949): 3,017 mi. of main line, 7,870 mi. of industrial trackage. Roads (1949): 1,720 mi., including 600 mi. of improved highways. Motor vehicles (Jan. 1, 1951): cars 72,392, lorries 32,377, buses 5,307. Merchant marine (June 30, 1949): 34 steamers and motorships (100 tons and over) aggregating 36,135 gross tons.

Finance. (Million pesos) Budget (1951-52 est.): revenue 299.8; ordinary expenditure 102.3, extraordinary expenditure 197.5. National debt (Dec. 31, 1949): 105.9, including 73.9 foreign. Currency circulation (June 30, 1951): 846; deposit money 523. Gold reserves (Nov. 30, 1951) U.S. \$501 million. Monetary unit: *peso* officially pegged at par with the U.S. dollar.

(J. W. Mw.)

CURAÇAO: see NETHERLANDS OVERSEAS TERRITORIES.

CYCLING. R. H. Harris (Great Britain) won the world professional sprint title for the third successive time. The 1951 track events were held at the Vel Vigorelli, Milan, and the road events at Varese, near that city. The Italians won four of the seven titles: E. Sacchi won the amateur sprint event, while R. Mockridge (Australia) was second, A. Bevilacqua won the professional pursuit title, N. De Rossi the amateur pursuit, and G. Ghidini the amateur road race. In addition to Harris the non-Italian victors were Ferdinand Kubler (Switzerland), professional road race, and J. Pronk (Netherlands), professional motor-paced pursuit.

For the third consecutive year K. H. Joy (Medway Wheelers) won the British Best All-Rounder competition in 50-mi., 100-mi. and 12-hr. events, with an average speed of 23.414 m.p.h. For the fourth time his club won the team

The finish of the final stage in the 14-day Tour of Britain sponsored by the "Daily Express" (London) and run under the rules of the British League of Racing Cyclists.

competition. The women's competition over 25 mi., 50 mi. and 100 mi. was won by E. M. Horton (Coventry C.C.).

Over shorter distances the most successful rider was D. J. Keeler (Vegetarian C. and A.C.). He covered 25 mi. in under 1 hr. no fewer than 12 times. He set up a new record of 57 min. 11 sec., and twice broke the 30-mi. record, his fastest time being 1 hr. 9 min. 20 sec. However, he finished fourth in the 25-mi. championship. The winner was R. Inman (Mercury R.C.) in 57 min. 17 sec. G. K. Bentley (Bec. C.C.) set up a new record for 50 mi. in 1 hr. 58 min. 29 sec. in the national championship. The 100-mi. title was won by L. V. Willmott (Midland C. and A.C.) in 4 hr. 14 min. 33 sec. The fastest 100 mi. of the year was ridden by Joy. He broke the 12-hr. record when he covered 260.02 mi. to win the 12-hr. title. New record figures for the 24-hr. event were also set up. G. Andrews (Addiscombe C.C.) covered 461.31 mi. to win the championship; this was 1.81 mi. more than the previous record.

The Isle of Man road race was won by R. W. Bowes (Solihul C.C.). The national massed-start title was won by P. R. Proctor. The *Daily Express* (London) organized a 14-day Tour of Britain held under the rules of the British League of Racing Cyclists. The winner was I. Steel.

Alan Bannister (Manchester Wheelers), amateur sprint champion from 1948, lost his title in July to 20-year-old Cyril Bardsley (Manchester Clarion). R. Waters (South London R.C.) won the 50-mi. tandem-paced title for the third time. The following day Waters lost his 5-mi. grass title to W. E. Jones (Birchfield C.C.). The $\frac{1}{2}$ -mi. grass title went to R. Kitchenham (Actonia C.C.), while W. B. Box (Derby Ivanhoe C.C.) succeeded Alan Geldard (Manchester Wheelers) as 25-mi. champion.

The 2,909-mi. Tour de France was won by Hugo Koblet (Switzerland) in 142 hr. 20 min. 14 sec. His compatriot F. Kubler won the Tour of Switzerland and Fiorenzo Magni (Italy), the Tour of Italy. L. Mathys (Belgium) won the Tour of Belgium. The Paris-Brest race was won by M. Diot (France).

For the first time since 1939 a six-day race was held in Great Britain. A. Bruylandt and R. Andriaenssens (Belgium) won by a lap from A. Strom and R. Arnold (Australia). The distance covered was 1,527 mi. The winners also won similar events in Paris and Ghent, while the Australians had won at Berlin and Antwerp.

CYPRUS. British colony. An island in the eastern Mediterranean. Area: 3,572 sq.mi. Pop.: (1946 census) 450,114; (1949 est.) 480,000. Language: Greek 80.3%, Turkish 17.8%; English is spoken by about 10%. Religion: Greek Orthodox 80.4%, Moslem 17.9%. Chief towns: Nicosia (cap., 34,463); Larnaca (14,746); Limassol (22,693); Famagusta (15,912). Administration: governor; executive council, 4 official and 2 (incl. 1 Moslem) unofficial members. Governor, Sir Andrew Wright.

History. So far as the *enosis* movement for union with Greece was concerned 1951 was a good deal quieter than the previous year. The efforts of both the right and left wings of the movement to enlist foreign support in Europe and at Lake Success had met with little success. The anti-sedition law was made more specific, and in March the editor of a Communist newspaper and five others went to prison for taking part in a demonstration against the measure.

Prosperity and development continued. A new law established selected villages as "improvement areas" and set up local councils as a step towards a more fully developed rural local government; a forestry school was opened in September with students attending not only from Cyprus but also from north Africa, the middle east and Kenya; and a new power station at Dekhelia was due to start operating

early in 1952. The garrison was larger than ever before, being more than 10,000 strong, and in October an entire parachute brigade was transported from Cyprus to the Suez canal zone by air. Income tax rates were reduced.

Education. Primary school attendance (1949) 60,000. Other schools: secondary 42, agricultural 2, trade 1, teachers' training colleges 2.

Finance and Trade. Currency: piastre (180 piastres £1). Budget (1951 est.): revenue £4,800,000; expenditure £4,700,000. Foreign trade (1950): imports £13,500,000; exports £11,000,000. Main products: citrus, seeds, vine products, carob, wool and copper. (K. G. B.)

CYRENAICA: see LIBYA.

CZECHOSLOVAKIA. People's republic of central Europe, bounded W. and N.W. by Germany, N. and N.E. by Poland, E. by the U.S.S.R., S. by Hungary and Austria. Area: (before Sept. 28, 1938) 54,244 sq.mi.; after annexation of Subcarpathian Ruthenia by the U.S.S.R. (June 29, 1945), 49,330 sq.mi. Pop.: (1937 est.) 15,239,000, (1947 census) 12,164,095, (Dec. 31, 1949, est.) 12,536,000. Language: (official 1948 est.) Czech 67%, Slovak 25%, German 3.5%, Hungarian 3.5%, Polish 0.7%. Religion: (1930 census) Roman Catholic 77%, Protestant (all denominations) 7.5%, Czechoslovak Church 5.6%, Greek Catholic 1.6%, Jewish 1.9%, atheist 6%. Chief towns: (pop., 1947 census) Prague (cap., 921,416); Brno (272,760); Moravska Ostrava (181,181); Bratislava (172,664); Plzeň (118,152). President of the republic, Klement Gottwald; prime minister, Antonín Zápotocký.

History. In Feb. 1951 the government announced a large increase in the production targets of the current five-year plan. The changes were officially attributed to the enthusiasm and initiative of the toiling masses, who felt capable of greater efforts, and to the generous help of the Soviet Union and people's democracies, which supplied the country with the necessary materials. The growing emphasis on the development of the armed forces and war industry, to defend peace and meet the threats of the imperialists who had unleashed aggression in Korea, provided another explanation. Under the revised plan the yearly increase in industrial output was to be 22% instead of the originally planned 16%. The targets for coal production exceeded the original targets by 20%, of chemicals by 30% and of heavy engineering by 48%. The output of heavy industry as a whole in 1953 was to be 230% of the 1948 level instead of 170%.

Problems of manpower and management continued to worry the government throughout the year. During 1950 the number of women in industry had increased by 135,000 and during 1951 pressure continued to recruit women workers. Serious attempts were made to diminish the number of clerical workers and to transfer men and women from office jobs to direct production. By the end of October 72,000 persons had been so transferred. There was still an acute shortage of coal miners. On Oct. 17 a statement was made by the Communist party that in the important Moravska Ostrava coal basin the plan had been systematically under-fulfilled. Both workers and management were to blame. A large part of the labour force stayed in the mines only for a short period. The standards of output ("norms") on which wages were based were too low. Existing machinery was inadequately and wastefully used. The local branches of the Communist party had failed in their duty of creating toiling enthusiasm by political enlightenment. The party decided radically to reorganize the managing personnel, to raise norms and to introduce a new wage system providing greater incentives. Local Communists were reminded of their duty "to train young miners in loyalty to and pride in their occupation and in devotion to the Communist party, the U.S.S.R., Gottwald and Stalin." During the year Zápotocký continued, as in earlier years, to urge the workers to gaster

efforts and to deplore their slackness. In March he told miners that the demand for a 6-hr. shift on Saturdays, which had been correct in prewar Czechoslovakia, was now anti-revolutionary, tending to undermine the building of socialism. On Oct. 31 he told the National Assembly that in 1950 wages and salaries had risen by 25% but output only by 15%. Welfare institutions were being abused by persons not entitled to them. The plans of the educational authorities were too lavish. On Nov. 9 the premier, himself a veteran trade unionist, told the Trade Union council that demands from the workers for more equal wages must be resolutely resisted. The government had already gone dangerously far in raising the wages of the lower-paid and unskilled categories of workers. The improvement of working conditions for the miners had been from the government's point of view a complete waste: "We did not get a single extra ton of coal out of it." On Nov. 13 the government announced an increase by 15% of the norms in the steel industry and the introduction of a new system of progressive piece rates.

Government spokesmen often stressed the need to speed up the collectivization of agriculture. Zápotocký in October stated that supply difficulties in the towns were due to the fact that the workers' demand for meat had risen in comparison with the prewar period. Higher agricultural output, the premier declared, would come only when agriculture was socialized. The faster the peasants were persuaded to join collective farms, the sooner the supply problem would be solved. According to a statement in the assembly on Nov. 1 by Antonín Novotný, there were then more than 7,000 "agricultural co-operatives" or preparatory committees for the formation of such, and these together held nearly 27% of the arable land in Czechoslovakia. The significance of this figure was not absolutely clear, as there were several types of "co-operative," some of which still allowed considerable concessions to private ownership. The increased speed of collectivization could not however be doubted.

On Sept. 7 a reorganization of the machinery of government was announced. The Ministry of Heavy Industry was subdivided into five separate ministries: Fuel and Power, Foundries and Ore Mines, Chemicals, Heavy Engineering and General Engineering. A new Ministry of Forests and Timber Industry was created. The old Ministry of Labour and Social Welfare was transformed into a Ministry of Manpower, and its welfare functions distributed between the other departments. A Ministry of State Control was introduced, based on the institution of the same name in the Soviet Union. Its task was to watch the administration generally, to check up on the efficiency, honesty and political orthodoxy of officials and to encourage and act upon complaints and denunciations by citizens. The former head of the Slovak regional government, Karel Bacilek, became minister of state control and Gustav Kliment became minister of heavy engineering. Bacilek was succeeded in his Slovak post by Julius Duriš, who had held the Ministry of Agriculture since 1946. His place was taken by Josef Nepomucký. The other new nominees were persons who had not hitherto been politically prominent.

The government reorganization was accompanied by the abolition of the post of general secretary of the Communist party and the transfer of its hitherto powerful holder, Rudolf Salzman-Slanský, to a vice premiership without clearly defined functions. Two months later it was announced that Slanský had been arrested for treasonable activities. The fall of Slanský marked the first open major crisis in the Communist party, which had hitherto escaped the convulsions that afflicted its sister parties in neighbouring lands. The Slovak Communists Vlado Clementis and Gustav Husak, disgraced in 1950 and formally expelled from the party in

Feb. 1951, had been relatively minor figures. Otto Sling, party secretary in Brno, unmasked in Feb. 1951 as an agent of the imperialists, was not a leading personality. More important was Marie Svermova, unmasked at the same time, who had been an important organizer and a close associate of Slanský. After his fall, Slanský was indiscriminately associated in official propaganda with all the previously disgraced Communists and with the western warmongers. The real reason for his fall was not yet clear. There was little doubt that he had for some time been on bad terms with Gottwald and that his overthrow was a personal triumph of the president. Three other points were of interest. One was that Slanský was generally regarded as being the most servile "Muscovite" in the party, the least likely of all to turn Titoist; yet Gottwald would hardly have dared to arrest him without the knowledge of Moscow's consent. The second was that Slanský could be overthrown in spite of the fact that as general secretary he controlled the party hierarchy. The third was that Slanský was a Jew, a fact which would not recommend him to the rank and file of the party, though it would not necessarily count against him in Moscow.

Czechoslovakia's foreign policy continued faithfully to follow the Soviet lead. Spy trials included alleged French agents in Bratislava in mid-June and the U.S. newspaper correspondent William Oatis in July. On Oct. 23 Wilhelm Pieck, president of the Eastern German republic, paid an official visit to Prague. He publicly declared the transfer of the Sudeten German population to Germany an "irrevocable, just and final solution." Zápotocký and Gottwald made fulsome speeches of welcome. (See also EASTERN EUROPEAN ECONOMIC PLANNING.) (H. S.-W.)

Education. Schools (1948): elementary 12,019, pupils 1,059,010; higher grade 2,280, pupils 463,295; secondary 292, pupils 70,440; vocational 1,243, pupils 91,160; universities 7, students 31,769; institutions of higher education 10, students 23,127.

Agriculture. Main crops ('000 metric tons, 1949; 1950 in brackets): wheat 1,573 (1,590); barley 1,116 (1,225); oats 1,107 (1,080); rye 1,339 (1,170); maize 231; potatoes 6,263 (7,480); sugar, raw value 627 (880); grapes 60; linseed 11. Livestock ('000 head): cattle (Jan. 1951) 4,100; sheep (Jan. 1950) 480; pigs (Jan. 1951) 3,700; horses (Jan. 1950) 640; goats (Jan. 1949) 982; poultry (Jan. 1949) 15,131. Food production ('000 metric tons, 1949): butter 30; milk 2,618; factory cheese 13.9; meat 290, of which beef 104.

Industry. Persons employed in manufacturing industries (Nov. 1949) 1,477,700. Fuel and power (1949; 1950 in brackets): coal ('000 metric tons) 17,004 (18,500); lignite (000 metric tons) 26,520 (27,500); manufactured gas (million cu m.) 2,189; electricity (million kwh.) 8,268 (9,120). Raw materials ('000 metric tons, 1949; 1950 in brackets): pig iron 1,700 (1,800); steel ingots and castings 2,745 (2,900). Manufactured goods (1949): cotton piece-goods (million metres) 318.0; cotton yarn ('000 metric tons) 75.8; wool yarn ('000 metric tons) 35.4; rayon filament yarn ('000 metric tons) 5.5; rayon staple fibre ('000 metric tons) 20.5; sheet glass ('000 metric tons) 135.5; cement ('000 metric tons) 1,740. New dwelling units completed (1950) 13,000. Production of motor vehicles (1948; 1949, six months, in brackets): 25,200 (14,160). Index of industrial production (on basis of 1937=100, 1950) 147.

Foreign Trade. (Million korunas, 1949; 1950, nine months, in brackets): imports 39,399 (25,785); exports 40,308 (26,894).

Transport and Communications. Roads (Dec. 1946): 43,969 mi. Licensed motor vehicles (Dec. 1950): cars 165,000, commercial 65,000. Railways: (1947) 8,161 mi.; passenger-mi. (six months, 1949) 5,502 million; goods ton-mi. (six months, 1949) 4,401 million. Air transport (1949): flights 16,833; mi. flown 4,884,000; goods ton-mi. 2,598,000. Telephones (1949): subscribers 350,708. Wireless licences (1949): 2,280,017.

Finance and Banking. Budget (million korunas): (1950 est.) revenue 131,930, expenditure 131,556; (1951 est.) revenue 166,520, expenditure 166,100. Currency circulation (March 1950): 72,000. Bank deposits (Jan. 1950): 146,000. Monetary unit: *koruna*, with an official exchange rate of Kč. 140 to the pound and Kč. 50.00 to the U.S. dollar.

See R. H. Bruce Lockhart, *Jan Masaryk* (New York, 1951).

DAHOMÉY: see FRENCH WEST AFRICA.

DAIRY FARMING. The steady increase in numbers of milk cows in the United Kingdom, which had continued

over many years, was broken in 1951. The relevant figures are given in the table.

COWS AND HEIFERS IN THE UNITED KINGDOM
(thousand head)

	Cows and Heifers in milk	Cows in calf but not in milk	Heifers in calf
1939	2,841	480	564
1949	3,049	641	911
1950	3,139	628	862
1951	3,031	604	821

SOURCE: *Monthly Digest of Statistics* (H.M.S.O., London, Sept. 1951).

The population of cows and heifers in milk and dry decreased by 132,000 head (3.5%) between June 1950 and June 1951, and the number of heifers in calf by 41,000 head (4.8%). From 1939 milk producers had been favoured compared with other livestock producers, both in respect of prices they received for their milk and the rationed feeding-stuffs they were allowed, but in 1951 this was much less marked. The prices fixed for 1951-52 and the high prices of feedingstuffs were considered by most producers to reduce sharply the attraction of milk production. The break in the upward trend to cow population was the result of producers' decisions, either simply to cease milk production for sale or to concentrate on their best milking stock. The price to producers for milk in 1950-51 was about 34.9d. per gal., plus bonuses and premiums equivalent to about 2.2d. per gal. The price for 1951-52 was about 1½d. per gal. higher. The average price prewar was about 12.8d. per gal.

Because farmers were using better cows and were becoming more skilful in managing them, the amount of milk produced did not necessarily follow the trend in numbers of cows. Farmers sold 1,803 million gal. of milk between Sept. 1950 and Aug. 1951, as compared with 1,853 million gal. in the corresponding period of 1949-50, a decrease of 3%. However, the late spring and cool summer of 1951 may have accounted for part of the decline.

For the first time since World War II, the sale of fresh cream was allowed in 1951 by the Ministry of Food. Consumption of liquid milk also tended to increase in 1951, sales for this purpose being 55 million gal. (3.6%) higher in the period Sept. 1950 to Aug. 1951 than in the previous year.

The development of artificial insemination of dairy cows (one way of improving the quality of commercial dairy cattle) was shown by figures issued by the Milk Marketing board, who operated the service. More than 55,000 farmers were members of the insemination centres which provided over 400,000 inseminations in 1949-50. (K. E. H.)

United States. During 1951, the dairy industry was estimated to have produced about 1% less milk than in 1950. Milk production was just under 120,000 million lb. The rate of milk production per cow in 1951 approximately equalled or slightly exceeded the 1950 record of 5,292 lb. The number of milk cows at the end of 1951 was expected to approximate to the 22,660,000 on farms at the beginning of the year, a slight decline as compared with the more than 22,700,000 in the two preceding years and 12% less than the peak number of the middle 1940s. The trend toward use of fresh milk rather than its products continued in 1951. Consumption of fluid milk and cream was about 395 lb. a head for civilians in 1951, 3% more than in 1950 and 16% above prewar levels, despite somewhat higher prices than in 1950 in most urban markets.

The U.S. cheese consumption in 1951 was estimated at 7.5 lb. a head—the same as in 1950 but 36% above prewar. Consumption of evaporated milk in 1950 was about 17 lb. per person as compared with a record of 18.3 lb. in 1948. Production in 1951 was heavy in expectation of a large military demand. The ice cream consumption in 1951 was estimated at not less than 40 lb. a head. This was far below the 56 lb. of 1946 and far above the prewar average of 23.7 lb. Butter

production and consumption declined from 1,666 million lb. or 10.8 lb. per person in 1950, to 1,500 million lb. and only 9.7 lb. per person in 1951. (J. K. R.)

DALAI LAMA. PAMO TÖNIRUP*, the 14th dalai lama of Tibet (b. near Jyekundo, eastern Tibet, June 6, 1935), was the youngest of the five children of a Tibetan peasant couple, Chogchu and Dhakya Tsiring. Lamaist emissaries from Lhasa identified him as the new earthly incarnation of Chenrezi, God of Mercy, the patron deity of Tibet, who on Dec. 17, 1933, departed from the body of the 13th dalai lama. Enthroned in the Potala, or chief palace, of Lhasa on Feb. 22, 1940, the Ling Erh (Divine Child) received a name meaning "The Holy One, the Gentle Glory, Powerful in Speech, Pure in Mind, of Divine Wisdom, Holding the Faith, Ocean-wide." On Dec. 21, 1950, the dalai lama left Lhasa secretly and on Jan. 2, 1951, reached Yatung on the border of Sikkim. After the Chinese-Tibetan agreement concluded in Peking on May 23, it was believed in New Delhi that China had recognized local self-government of Tibet (*q.v.*) and that the dalai lama could safely return to Lhasa.

* His name is variously spelt "Lamo Tanchu" (*Chinese Yearbook 1943*) and "Lamu Lankha" (*Almanach de Gotha 1944*) but "Pamo Töntrup," in Sir Charles Bell's *Portrait of the Dalai Lama* (London, 1946), seems to be the nearest to the phonetic transcription of the Tibetan name.

† Dalai, a Mongolian word, means "all embracing."

DANCE. The feature of 1951 in the dance was quantity, both in the multiplication of companies and of works, and, in consequence, quality suffered. It was not that there was any shortage of potentially competent dancers but that, in many cases, their training was accelerated to meet the demand. The true shortage lay in the lack of art directors with a policy, a background of knowledge and true authority in the arts that make up the composite art of ballet. The public demand for ballet increased through the exhibition of such glamorizing films as *The Red Shoes* and *Tales of Hoffmann* (1951), but this new public had no standards and demanded dancing stars rather than ballet. This had occurred before, at the end of the romantic period, when the idolatry of Taglioni, Elssler, Grisi, Grahn and Cerrito had reached so high a peak that it no longer mattered what they danced so long as their name was on the playbills. Had it not been for the vitality of the Russians, to whom ballet was still something of a novelty, it would have degenerated into a music-hall attraction.

The year 1951 also saw the death of many important figures in the world of dance: of N. Sergheyev (June 23, 1951), the old St. Petersburg maître de ballet who revived so many of the classics of Petipa and Ivanov in western Europe; of Adolf Bolm (April 16, 1951), who, in the Polovtsian dances from *Prince Igor*, played so large a part in re-establishing the role of the male dancer when Diaghilev came to Paris in 1909; of Colonel W. de Basil (*see* OBITUARIES), who, in 1932, in association with the late René Blum, re-formed Les Ballets Russes de Monte Carlo, starting the great renaissance of ballet; of Edmond Audran (July 20, 1951), a young French dancer of outstanding ability; and finally of Constant Lambert (*see* OBITUARIES), one of the founders of the Sadler's Wells tradition. Lambert's demise was a particularly tragic loss for ballet since his work was by no means completed and he, more than anyone, stood for ballet as against the dangerous dancer-domination already mentioned.

London still remained the centre of dance activity in 1951, at any rate as far as quantity was concerned, some 30 companies from all over the world having performed there. The Sadler's Wells ballet at Covent Garden created three important works; Frederick Ashton's *Daphnis and Chloë*, to Maurice Ravel's score, with decor and costumes by John

The first performance at the Royal Opera house, Covent Garden, London, on Dec. 12, 1951, of Léonide Massine's ballet "Donald of the Burthens." Death, danced by Beryl Grey (back to camera), is seen during the finale of scene 2.

Craxton; the same choreographer's *Tiresias*, with music by Constant Lambert and decor and costumes by Isabel Lambert; and Léonide Massine's *Donald of the Burthens*.

Ravel's score for *Daphnis and Chloe* had long been familiar as a concert suite, despite the fact that it was originally commissioned for ballet (1912), with choreography by Fokine. The music is so complete in itself that it places a severe burden on the choreographer. Also the subject, with its Grecian setting, sets the grave problem as to whether to adopt the conventional pseudo-Greek movement, the line of least resistance adopted by Fokine, or to avoid it as Ashton did; he told his story in movement adopted from modern Greek folk dance and from ballet itself. The result served to underline the beauty of the score and there were many moments of superb choreography. The failure, and it was inevitable, was due to the nature of the music itself and to its length. Craxton's decor was in the spirit of the work, but his costumes lost the feeling of a Greece in which peasants, heroes and immortals co-existed.

Tiresias, Lambert's last composition, was also based on mythology. Its setting was in Crete and this gave the choreographer admirable opportunities for a rich composition in which Egypt and Greece met. And these he seized upon in many scenes that were powerful and imaginative. The failure there was one of length. Had the ballet been cut by some 20 min., and there were hopes that it might be, its impact would have been tremendous. Isabel Lambert's debut as a scenic artist was, in spite of some banality and a drop curtain of "old-fashioned modernity," highly successful.

Léonide Massine created *Donald of the Burthens*, a ballet on a Scottish theme making use of authentic folk material. The music by Ian Whyte was scholarly if not particularly distinguished, the scenery and costumes by Robert Colquhoun and Robert MacBryde suggested that these two painters had a really important contribution to make to the theatre. The choreography was a fine piece of craftsmanship, showing that rare thing, a complete translation of folk material. In his handling of a crowd, the ground pattern, the entrances and exits and the superb finale Massine showed himself a great master. Indeed, he had no technical equal. Where the ballet disappointed was in its drama, its promising Faustlike theme being used as an excuse and not as a reason for dancing. The role of Death, however, gave an opportunity, long overdue, for the ballerina Beryl Grey to show not only

her brilliant virtuosity but a real command of the stage.

The Sadler's Wells Theatre ballet, which left for a Canadian-U.S. tour in Sept. 1951, had its most important year, revealing a choreographer of marked personality in the South African John Cranko. His two outstanding works were in marked contrast to one another; *Pineapple Poll*, with a score made up from a dozen Sullivan operettas by Charles Mackerass, based on a Gilbert Bab Ballad "Bumboat Annie" and decorated by Osbert Lancaster, and *Harlequin in April*, with music by Richard Arnell and decor and costumes by John Piper, based on some lines in T. S. Eliot's *The Waste Land*. The first was a fine example of English humour, direct and unsophisticated, the second was the evocation of an atmosphere by means of a symbolism that was evident in action but by no means easy to comment upon. The young company showed itself as versatile as its choreographer.

The newly formed Festival ballet, though depending on its star dancers Alicia Markova and Anton Dolin, had such guest artists as Alexandra Danilova and Mia Slavenska. Its repertoire consisted largely of the classics, but the company gave a very successful revival of the Polovtsian dances from *Prince Igor*. It was the first English company to dance in Monte Carlo in 1950-51 and 1951-52. The International ballet appeared at the new Festival hall and continued to break new ground in the provinces.

A new company, the Original Ballet Russe, was formed to succeed Colonel de Basil's company, the Ballet Russe de Monte Carlo. This company had a Christmas season at the Festival hall.

The Rambert ballet celebrated its 25th anniversary in 1951. It was the pioneer British company, with a record of discovery second to none. It presented two creations, both with choreography by David Paltenghi. The first, *Fate's Revenge*, created for the Bath assembly, was a frolic in the regency manner; the second, *Canterbury Prologue*, with music by Pehr Racine Fricker and scenery and costumes by Edward Burra was an interesting attempt to "balletize" Chaucer. Like Paltenghi's previous essay on Keats's *The Eve of St. Agnes*, it was only a partial success but the attempt was worth making. This ballet, Lambert's *Tiresias* and Arnell's *Harlequin in April* were all Arts council commissions for the 1951 Festival of Britain.

A Swedish company under the title of the Swedish ballet, but assembled for touring, gave performances of ballets by Birgit Cullberg based on Euripides, Kafka and Strindberg.

The translation of these literary themes was not successful. *Miss Julie*, alone, enjoyed a certain *succès de scandale*.

The Marquis de Cuevas' Grand ballet showed works by a new choreographer, the dancer George Skibine. The most noteworthy was *Annabel Lee*, danced to a recitation of Poe's poem. This was sensitive and sincere. Whether the choreographer could handle large masses, the true test, remained to be seen.

French ballet was the poorer for the closing down of Roland Petit's Ballets de Paris. Les Ballets des Champs Elysées regrouped but lacked a choreographer who could carry on the richly inventive tradition associated with the company. The ballet at the Opéra, the oldest of all companies, tried the innovation of a full-length work, the first to be created in the building. Serge Lifar, the choreographer, chose Snow White as his subject. The story was treated in a straightforward fairy-tale manner with some highly ingenious choreography in the neoclassical manner. The weakness of the production lay in the music by Maurice Yvain, the famous writer of operettas. There were many tuneful melodies but the orchestration was poor. The scenery and costumes were by Dimitri Bouchenne. The popularity of this ballet with the public, not the critics, showed a trend in favour of the full-length spectacle. England had seen the same with Frederick Ashton's *Cinderella*, but the problem remained one of finding suitable scores.

The year 1951 also saw a great number of dancers from outside the ballet tradition. In every case their problem was to translate for the stage works created for totally different surroundings. Rosario and Antonio thrilled by their virtuosity, the latter being unequalled as a technician; but theirs was a concert composed of interesting fragments. José Greco and later Pilar Lopez brought Spanish dancing to the theatre. Pilar's ballet, based on Enrique Granados' *Goyescas*, was not only the most complete Spanish work seen, but one of the finest ballets shown for many years.

The public for Indian dancing increased, largely through the demonstrations of Ram Gopal, who had educated a large public. Ram Gopal, Mrinalini Sarabhai and Uday Shankar all gave seasons with their companies. Sarabhai completely solved the problem of theatre presentation. Without any sacrifice of the authentic spirit or technique she was able to present complete dramatic works as distinguished from divertissements. Her dance drama *Man*, a dance-symbolized story of birth, life and death was both direct and moving.

Pearl Primus and a small company gave a season of ethnographic dances as well as some creations in the modern manner. Interesting both as a dancer and personality, she unfortunately failed to distinguish between lecture and spectacle.

A Latin-American company gave a spectacle based on folk dance but here the dancers were not sufficiently good nor the material authentic enough to do more than show some disconnected numbers of revue type, numbers distinguished, however, by admirable costumes and sets.

These many travelling companies from outside the classical tradition proved, however, that the public was beginning to realize that there were other forms of dancing than ballet. Their growing popularity made it imperative for ballet to become creative once again. (A. L. HL.)

United States. The New York City ballet made its Chicago debut and danced for 15 weeks in New York, presenting nine new ballets. George Balanchine choreographed *La Valse*, *Capriccio brillante*, *Tyl Ulenspiegel* and *A la Française*, with music by Maurice Ravel, Felix Mendelssohn, Richard Strauss and Jean Françaix, respectively. *Lady of the Camellias* had choreography by Antony Tudor and music by Giuseppe Verdi. Jerome Robbins choreographed *The Cage* and *The Pied Piper*, with music by Igor Stravinsky and Aaron Copland. *The*

Miraculous Mandarin had music by Béla Bartók and choreography by Todd Bolender, and *Cakewalk* had music by Louis Moreau Gottschalk and choreography by Ruthanna Boris. *The Card Party*, *The Fairy's Kiss*, *Concerto barocco* and *The Four Temperaments* were revived. Tudor restaged his *Lilac Garden* for this company, and danced in it.

The Ballet theatre toured the United States and South America, and danced for six weeks at the Metropolitan Opera house, New York. The company produced *The Thief Who Loved a Ghost*, with choreography by Herbert Ross and music by Carl Maria von Weber; *Ensayos Sinfónicos*, with choreography by Alicia Alonso and music by Johannes Brahms; *Tropical Pas de Deux*, with choreography by Enrique Martínez and music by Amadeo Roldán; and *Schumann Concerto*, with choreography by Bronislava Nijinska and music by Robert Schumann. Roland Petit's *Les Demoiselles de la Nuit* and Jean Babilée's *Till Eulenspiegel* were given for the first time in America.

Zachary Solov was appointed ballet director at the Metropolitan Opera, with Janet Collins (the first Negro artist to be engaged by the Metropolitan Opera) and Maria Karnilova as premières danseuses. Choreographers for the New York City opera were Charles Weidman, Sophie Maslow and Grant Mouradoff.

José Greco and his Spanish ballet enjoyed a long season in New York. Experimental groups active in New York included Theatre Dance, New York Ballet club and Choreographer's Workshop, which also appeared in Bermuda.

Harold Lang, Janet Collins and Jerome Robbins received Donaldson awards for dancing and choreography in musical comedy, while the Antoinette Perry award went to Michael Kidd, and the Capezio award to Zachary Solov.

In October, the Sadler's Wells Theatre ballet began its first American tour. Ana Maria, Iva Kitchell, Lillian Moore, Marina Svetlova, and Slavenska's Ballet Variants also made extensive tours.

The San Francisco ballet produced *Le Gourmand*, choreographed by Lew Christensen, and *Les Maîtresses de Lord Byron*, choreographed by William Christensen. In Los Angeles, Lester Horton reopened his Dance Theatre. The Concert ballet was organized by Lasar Galpern. Michel Panaiell's Ballet Intime toured the Pacific northwest. Roland Petit's Ballets de Paris disbanded in Hollywood. Experimental groups were active throughout the country. (LN. M.)

Ballroom Dancing. The principal changes in ballroom dancing during 1951 affected the so-called Latin dances. The most noticeable development was the return of the tango. Another outgrowth affected the rumba. This dance had already achieved an international popularity second only to the fox trot. There was, however, a change in the style of the dance—musical compositions shifted from regular, measured beats to a syncopated form known as mambo. Step patterns to this tempo resemble a combination of rumba and jitterbug. Samba, the Brazilian variation of the waltz, continued to flourish. There were no dance crazes or unusual novelties during the year. The Charleston, which had been revived during 1950, died out. (A. MU.)

DATO ONN BIN JA'AFAR: see ONN BIN JA'AFAR, DATO.

DEATH STATISTICS: see VITAL STATISTICS.

DECORATIONS AND MEDALS. The war in Korea caused the introduction in Great Britain of the *Korea Service Medal*. For the first time an international organization issued its own service medal which was to be awarded to servicemen of national forces; the institution of the *United Nations Service Medal* was announced in July

and the details of the award were published in September. The medal would be given to members of land, sea and air forces participating in the United Nations action in Korea, members of semi-military units serving in Korea and members of the armed forces of the Republic of Korea. The medal was circular and of a bronze alloy, the obverse bearing the inscription "For Service in Defence of the Principles of the Charter of the United Nations" and the reverse the emblem of the United Nations. The ribbon had nine stripes of United Nations blue and eight white stripes.

The obverse and reverse of the United Nations medal for service in Korea.

In the Commonwealth the institution of the *Korea Medal* was announced in July. The cupro-nickel medal, bearing the effigy of King George VI, would have a ribbon of blue and yellow, the blue representing that of the United Nations flag. The design of the reverse was not made known. The medal would be awarded to officers and men of the Royal Navy, the army and the Royal Air Force who served for one day or more in Korea, or, for the Royal Navy, 28 days off the Korean coast, or, for the Royal Air Force, one operational sortie over Korea or Korean waters or 28 days in Korean waters. Certain civilians would be eligible for the award as would the forces of the Commonwealth.

Up to the end of October 135 awards had been made to British servicemen in Korea. Two Victoria Crosses were awarded, to Major Kenneth Muir of the Argyll and Sutherland Highlanders (posthumous award) and to Private William Speakman of the Black Watch. The 1st battalion, Gloucestershire regiment, received the *United States President's Distinguished Unit Citation*. Other non-American units to receive this, the highest U.S. unit award, included "C" Troop of 170th Independent Mortar battery, R.A., the 3rd battalion of the Royal Australian regiment, the French battalion and the Turkish brigade.

A new award, the *Police Long Service and Good Conduct Medal*, was announced in June to be given for 22 years' pensionable or approved service in the British police forces. The king's head would appear on the obverse, and on the reverse the inscription "for exemplary police service" with the figure of justice. The ribbon was dark blue with, on each side, a white stripe on which was superimposed a narrow stripe of dark blue.

Hungary. An *Order of Merit of Motherhood* was instituted. On the lines of the *Medal of Motherhood* of the U.S.S.R., the first class was awarded to mothers with 11 or more living children.

Israel. Details were published of *Ot Hagvura* (Medal of Valour), the only military award in Israel for heroism in battle. A campaign medal *Ot Hakommiut* (Independence Medal) was issued in 1951 to all who saw at least four months' service in the Arab-Jewish war, 1948.

North Korea. The title of *Hero of the Korean People's Democratic Republic* was created. In addition to the title of hero the recipients received the *Gold Star Medal* and *Order of the State Banner*, 1st class. The title of *Hero of Labour* was instituted in July. Recipients would receive the *Order of the State Banner* and the *Hammer and Sickle Gold Medal*.

Pakistan. The government withdrew recognition in July of British titles conferred before partition in Aug. 1947. The *King's Police Medal* and the *Indian Police Medal* were renamed *Qaid-i-Azam Police Medal* and *Pakistan Police Medal* respectively.

South Africa. The government of the Union was considering instituting its own decorations in place of British awards.

Western Germany. In September, the *Order of Merit* was created. Its purpose was to extend recognition to men and women of Germany and other nations for services in the political, economic, social and the cultural fields, as well as for "assisting in the reconstruction of the fatherland, and in the peaceful development of the Federal republic." The cross was of red enamel with a golden setting and had the federal eagle in the centre. There were to be three classes: grand cross, distinguished service cross and service cross.

DEMOCRATIC PARTY, U.S.: see POLITICAL PARTIES, U.S.

DENING, SIR (MABERLEY) ESLER, British diplomat (b. April 21, 1897), served with the Australian Imperial force in World War I, entered the British consular service in 1919 and went to Tokyo in 1920. During the next 18 years he served in Tokyo, Osaka, Kobe, Seoul, Manila, Dairen and Harbin. When in Harbin (1934-38), after the annexation of Manchuria by Japan his brilliant linguistic gifts—he is fluent in Japanese, Chinese and Russian among other languages—made a deep impression. He went again to the east in 1943 as political adviser to Lord Louis Mountbatten, supreme allied commander, southeast Asia, and was concerned in negotiations between the Dutch and the Indonesian nationalists after the end of the Japanese war. In Jan. 1946 Dening represented Britain at the signing of the Anglo-Siamese agreement ending the state of war between the two countries. A few months later he returned to London as assistant under secretary of state, Foreign Office, in charge of the far eastern department. During the next four years he advised at the highest level on British policy in the far east and in Oct. 1950 he was made K.C.M.G. and left on a six-month tour to Hongkong, Malaya, Burma, Australia, New Zealand, Indochina, Nepal, India and Pakistan. In Sept. 1951 Dening succeeded Sir Alvary Gascoigne (q.v.) as head of the United Kingdom liaison mission in Tokyo and was to become the first postwar British ambassador to Japan after ratification of the Japanese peace treaty.

DENMARK. Constitutional monarchy of Europe, composed of the peninsula of Jutland and 100 inhabited islands, the largest being Zealand (Sjælland) and Fyn (Fünen). Denmark controls the three straits between Kattegat and the Baltic sea: the Oresund (between Sweden and Zealand), the Great Belt (between Zealand and Fyn) and the Small Belt (between Fyn and the Jutland peninsula). Area, excluding Faeroe Islands (q.v.): 16,573 sq.mi. (Peninsula of Jutland, 11,411 sq.mi.). Pop.: (1945 census) 4,045,232; (1950 est.) 4,271,000. Language: Danish. Religion: Lutheran, with small Roman Catholic and Jewish minorities. Chief towns (pop., 1945 census): Copenhagen including Frederiksberg and Gentofte (cap., 927,404); Århus (107,393); Odense (92,436); Ålborg (60,880); Esbjerg (43,241). Ruler, King Frederik IX; prime minister, Erik Eriksen.

History. On Feb. 9, 1951, the Danish Rigsdag approved

the arrangements, completed by the North Atlantic council at its meeting at Brussels on Dec. 19, 1950, for establishing an integrated force under centralized control and command in Europe. The Danish brigade, stationed in Western Germany, was at once placed under General Dwight D. Eisenhower's command, and Lieut. General Erik Moeller, commander in chief of the Danish army, was appointed commander of the Allied army forces in Denmark, subordinate to Vice Admiral Sir Patrick Brind in the Northern European command of the North Atlantic Treaty organization (N.A.T.O.). A bill organizing the Danish defence in accordance with the military plans of N.A.T.O. was passed in June. It provided Kr. 555 million annual expenditure for the armed forces and in addition a few hundred million kroner were allocated for new military equipment. It was expected that by 1954 the army would have a mobilization force of 100,000 men, supported by a home guard of 40,000 persons; that the navy would comprise light destroyers, motor torpedo boats, minelayers, minesweepers, escort vessels and submarines; and that the air force would number eight fighter squadrons, including one night fighter squadron. The strengthening of military preparedness was advanced further on Sept. 4 when, to prevent potential "fifth column" activities, an order of conduct was given to the armed forces instructing them with immediate general mobilization and immediate resistance in case of an aggression against Denmark or Danish military forces stationed outside Danish territory, and stressing that orders possibly given to stop the mobilization and the fight should be considered as false.

Until summer Danish opinion was strongly opposed to the suggested entry of Greece and Turkey into N.A.T.O., and Ole Bjørn Kraft, the Danish foreign minister, was instructed to vote against it at the meeting of the council at Ottawa (Sept. 16-20). The official Danish point of view was that such an extension would weaken the position of the Scandinavian countries and jeopardize the concept of a North Atlantic alliance. On Sept. 19, however, the Foreign Affairs committee of the Danish parliament approved, by the votes of the Conservatives, the Venstre and the Social Democrats against those of the Radicals and the Retsforbundet (14 votes to 2), a complete change of policy, the government explaining that, as Denmark stood alone in opposing the entry of Greece and Turkey, it did not wish to use its right of veto. The entry of Greece and Turkey into N.A.T.O. was approved by the Danish Rigsdag on Oct. 17.

Denmark continued during 1951 to give full support to all U.N. endeavours to secure a satisfactory and peaceful solution of the Korean conflict and voted for the U.S. resolution condemning China as an aggressor, the Danish delegate simultaneously stressing that the Peking government ought to be the representative of the Chinese people in the U.N. The Danish hospital ship "Jutlandia" left Denmark for Korea on Jan. 23. A U.N. proposal for sending Danish troops to Korea was adopted in the autumn, but not acted upon as it was considered difficult to release troops from Denmark during the first phase of rearmament.

Formal ending of the state of war with Germany was proclaimed on July 13, and Werner Best, German Reichskommissar in Denmark during World War II, was amnestied and repatriated to Germany on Aug. 28, after having served 6 years of the 12-year sentence imposed on him for war crimes committed during the German occupation.

The Soviet Union's claim that its territorial waters extended to a distance of 12 sea miles from the coast was maintained in 1951 and Danish fishing vessels were constantly captured in the international waters of the Baltic, although not in so great a number as in 1950. In order to get an international juridical decision the Danish government suggested that the

question should be submitted to the International Court of Justice, but the proposal was rejected by the Soviet Union on Aug. 22.

As in 1950 the income from exports fell short of expenditure on imports, and from July 1, 1950, to June 30, 1951, there was a Kr. 700 million deficit in the balance of payments. It was due to the increasing discrepancy between sharply rising import prices and practically stable export prices, Denmark's terms of trade being 65:100 in Aug. 1951 as against 83:100 in Aug. 1950. However, the raising of the bank rate in the autumn of 1950, restrictions on investments, sharply increased taxes and duties and compulsory savings, introduced in March 1951, caused consumption to fall, especially in the summer and autumn; unemployment also grew slowly from 2.4% in Sept. 1950 to 2.9% in Sept. 1951; so for the year from July 1, 1951, to June 30, 1952, the deficit in the balance of payments was expected to sink to Kr. 500 million. From mid-1951 the import prices mounted less rapidly and for textiles they even decreased; following the Danish-British trade negotiations the price to be paid by Great Britain for bacon was raised 5½% from Jan. 1, 1951, and in addition 12½% from Sept. 3, and the price for eggs was raised 25% from Oct. 1. Thus the Danish terms of trade were improved to 69:100 in September and further improvements were expected.

Elections for 28 seats in the Danish Landsting, or upper chamber, took place on April 3 in the islands of Zealand (excluding Copenhagen), Falster, Lolland and Bornholm and in South Jutland. Together with the remaining members of the Landsting,* the overall party position in the upper chamber was as follows (previous strength in parentheses): Social Democrats 33 (33), Venstre or Agrarian 22 (21), Conservatives 12 (13), Radicals 6 (7), Communists 1 (1), Retsforbundet 1 (0), Faeroe Islands seat 1 (1). The Conservative-Venstre minority government thus retained its 34 seats.

(H. L.N.)

Education. Schools (1949): elementary, middle and secondary 4,112, pupils 494,905; technical 340, pupils 56,000; commercial 207, pupils 34,400; agricultural 26, pupils 2,300; adult 56, pupils 6,500; teachers' training colleges 18, students 2,400. Universities 2, professors and lecturers 270, students 7,400. Institutions of higher education 5, professors and lecturers 152, students 3,958. No illiteracy.

Agriculture. Main crops ('000 metric tons, 1950; 1951 in brackets): wheat 298 (275); barley 1,615 (1,730); oats 834 (780); rye 331 (230); potatoes 1,850; sugar, raw value 322 (360). Livestock ('000 head): cattle (March 1951) 3,075, including 1,710 dairy cows; sheep (July 1950) 61; pigs (March 1951) 3,541; horses (July 1950) 503; goats (July 1949) 4; poultry (July 1950) 24,433. Dairy products ('000 metric tons, 1949; 1950 in brackets): milk 4,894 (5,413); butter 156 (179); cheese 64 (61); eggs 118 (132). Meat production ('000 metric tons, 1950; 1951, six months, in brackets): total 510.0 (306.2), of which beef and veal 168.0 (96.1); pork 342.0 (210.1). Index of livestock production (on basis of 1937=100, 1950): 107. Fisheries (1950): total catch 235,000 metric tons valued at Kr. 165 million.

Industry. Industrial establishments (June 1948): 109,288; persons employed 641,379. Fuel and power (1950; 1951, six months, in brackets): coal distributed ('000 metric tons) 8,400 (3,289); lignite ('000 metric tons) 768 (735); manufactured gas (million cu. m.) 377.4 (186.2); electricity (million kwh.) 1,814.4 (1,039.6). Cement production ('000 metric tons, 1950; 1951, six months, in brackets): 872.4 (444.2). New dwelling units completed (number, 1950; 1951, six months, in brackets): 19,968 (7,776). Index of total industrial production (1948=100; 1950; 1951, six months, in brackets): 118 (123).

Foreign Trade. (Million kroner, 1950; 1951, six months, in brackets): imports 5,890 (3,570); exports 4,592 (2,782). Main sources of imports (1950): U.K. 32%; Germany 11%; U.S. 9%; France 9%; Sweden 8%. Main destinations of exports: U.K. 42%; Germany 19%; Sweden 6%; Norway 4%; Finland 4%. Main imports: coal, petroleum and products 17%; textiles 16%; machinery and vehicles 11%; wood, paper and manufactures 8%. Main exports: dairy products 33%; meat and products 22%; machinery 7%; live meat animals 6%.

Transport and Communications. Roads (1950): 34,300 mi. Licensed motor vehicles (Dec. 1950): cars 117,000; commercial 62,000. Railways (1950): 2,996 mi., passenger-mi. 1,875 million; goods, ton-mi. 744 million. Shipping (merchant vessels of 100 gross tons and over, July

* Term eight years; 19 elected by the chamber itself; half the remainder elected every fourth year.

1950): 718; total tonnage 1,269,011. Air transport (1950): passenger-mi. 92 million; cargo, ton-mi. 2.7 million. Telephones (1949): subscribers 542,000. Wireless licences (1950): 1,236,274.

Finance and Banking. (Million kroner) Budget: (1950-51 est.) revenue 2,403, expenditure 2,391; (1951-52 est.) revenue 2,700, expenditure 2,690. Gross national debt (March 1948): 9,630. Currency circulation (Aug. 1950; Aug. 1951 in brackets): 1,441 (1,491). Bank deposits (Aug. 1950; Aug. 1951 in brackets): 4,915 (4,725). Gold and foreign exchange (million U.S. dollars, Sept. 1950; Sept. 1951 in brackets): 79.0 (97.2). Monetary unit: *kroner*, with an exchange rate of Kr. 19.34 to the pound and Kr. 6.92 to the U.S. dollar.

DENTISTRY. An outstanding feature of 1951 was the increased attention that was given throughout the English-speaking world to the prevention of dental disease. The presidential address of E. B. Dowsett to the annual meeting of the British Dental Association (*Brit. Dent. J.*, no. 2, July 17, 1951) was almost wholly devoted to the prevention of dental caries and to the need of bringing about a greater public appreciation of the importance of maintaining the teeth in a healthy state. This latter aspect of the matter formed the subject of a resolution adopted by the 4th World Health Assembly requesting the director general "to encourage the training of dental health personnel in preventive dentistry through the World Health organization fellowship programme."

Parallel with developments in the United States, an experiment was conducted in Great Britain by the Ministry of Education on the effect on the incidence of dental caries of treating children's teeth by topical application of sodium fluoride. This concern with preventive measures was deepened by a realization that the number of dentists was inadequate to cope with the amount of treatment required. On this point, the minister of health said that Great Britain needed 20,000 dentists—an increase of 9,000—if a proper standard of treatment was to be provided.

Much work was done during 1951 on the causes of dental disease. Professor E. B. Manley, and J. L. Hardwick, published an important paper "Caries of the Enamel" (*Brit. Dent. J.*, vol. 91, no. 2, July 17, 1951), in which they emphasized that no final solution of this problem was possible without the co-operation of scientists working in many different fields. (B. J. W.)

United States. Fluoridation of public water supplies to reduce the incidence of dental caries was in operation on July 1, 1951, in 102 towns and cities and in two state training institutions, and the number was steadily increasing. In several parts of the country, militant resistance to fluoridation appeared and to obviate objections that it was an infringement of an individual's liberty, the issue was being put to the vote in some communities.

In support of fluoridation of water supplies, on Dec. 1 the American Medical Association reported that it was safe. A subcommittee on fluoridation of the National Research Council urged that the procedure be considered by all fluoride-deficient communities.

Removal of decay and of deposits and stains by a new "airbrasive" technique attracted wide attention. A stream of abrasive was delivered at high velocity, the particles travelling well in excess of 1,000 ft. a second. It was claimed that with a hard abrasive such as aluminium oxide the tooth was rapidly cut away; with a softer material deposits and stains could be quickly removed without damage to the enamel. The technique aimed at eliminating the three objectionable characteristics of the drill, pressure, vibration and heat, and the pain associated with them. (L. M. S. M.)

DERMATOLOGY. Studies during 1951 indicated that seborrhoea and seborrhoeic dermatitis, characterized by bothersome oiliness, redness, scaling and itching of the face and scalp, might be the result of a metabolic defect in the

skin which increased the local requirement for pyridoxine, a fraction of the vitamin B complex. Seborrhoeic dermatitis was experimentally induced in a group of persons by treating them with desoxypyridoxine, a pyridoxine antagonist. It was then eradicated by treatment with pyridoxine, suggesting that the condition might be an indication of human pyridoxine deprivation.

Patients with ordinary seborrhoeic dermatitis, not experimentally induced, were treated with large doses of pyridoxine both orally and by injection but without change in the lesions. But when the pyridoxine was administered topically, in an ointment, the areas of seborrhoeic dermatitis cleared within a period of three weeks and reappeared shortly after therapy stopped. Control areas were not improved.

The studies indicated that the skin converted pyridoxine *in situ* to a metabolically active substance, and, in a broader sense, the studies suggested that disease might on occasion be caused by local, probably conditioned deficiency.

It was suggested that baldness might be influenced by certain constituents in sebum, an oil secreted by human skin. This theory evolved from the observation several years before that a group of workers engaged in the synthetic rubber industry became temporarily bald. The hair fall was subsequently traced to a group of chemicals classed as intermediary polymers or dimers and one of them, chloroprene, not only affected loss of hair in experimental animals but also affected the hair follicles and the sulphhydryl group of chemicals normally present in hairs. It was postulated then that similar changes might be the result of naturally occurring chemical compounds and it was observed that one, squalene, a constituent of human sebum, when applied to the skin of experimental animals did cause depilation which was localized to the site of application and reversible. The mode of action had not been determined at the close of 1951 but the suggestion was made that squalene or a related unsaturated compound present in sebum might be a factor.

Penicillin 92 was introduced with evidence to indicate that it had an antibacterial spectrum *in vitro* similar to that of procaine penicillin G, the form of penicillin usually administered; it also possessed highly desirable hypoallergenic properties. It was found in a comparative study with other antibiotics on 100 patients to be excellent for topical use against ordinary bacterial infections of the skin.

Two enzymes, hyaluronidase and streptokinase-streptodornase, were recommended for the treatment of chronic cutaneous ulcers. The former, a naturally occurring enzyme which was important in the control of viscosity of tissues, promoted rapid healing when applied in three cases of leg ulcers of many years' duration which had resisted all orthodox treatment. The latter, a preparation of proteolytic enzymes elaborated by group C streptococci, employed as a lytic agent for medical *débridement* to liquefy and dissolve purulent and fibrinous deposits, was used successfully for the treatment of infected burns, wounds, ulcers, abscesses and areas of necrosis.

A number of new dermatological entities were added to the list of diseases affected favourably by treatment with ACTH and cortisone during 1951. These were herpes gestationis, pretibial myxoedema, pityriasis rubra pilaris, erythema multiforme, sarcoid, acute irritant dermatitis and acute ringworm of the hands and feet.

Triethylene melamine and proteinamine, new agents for the treatment of cancer, were reported to be successful in effecting improvement in diseases such as certain leukemias, Hodgkin's disease (lymphosarcoma) and other lymphoblastomas. The action of triethylene melamine, administered by mouth, was similar to that of nitrogen mustard but it produced much less nausea, vomiting and central nervous system stimulation. Proteinamine (methyl-bis-betachloroethylamine) effected remissions in addition in two cases each of acute lupus

erythematous and polyarteritis. Results from proteinamine in 59 cases were as good as those obtained from treatment with nitrogen mustard, but proteinamine had certain advantages: practically without nausea or vomiting, it reduced blood system toxicity; it was tolerated by children and was used on ambulatory patients.

Quotane for topical administration and pronestyl for oral use were both recommended for the relief of itching. Quotane, an amino ether derivative of isoquinoline chemically unrelated to any of the popular "caine"-type local anaesthetics, was found to be more effective and safer than the latter compounds. Though it had been used for urologic instrumentation for some time, its use in dermatology was new. The first results indicated it to be no panacea but effective for the relief of itching. (H. RA.)

DE VALERA, EAMON, Irish statesman (b. New York, Oct. 14, 1882). For his earlier career see *Encyclopædia Britannica*. He was *taoiseach* (head of government) and minister for external affairs from Dec. 1937 to Feb. 1948, and had been president of the assembly of the League of Nations in 1938. During World War II he kept Ireland to a policy of strict neutrality though when Belfast, in Northern Ireland, was heavily blitzed he at once ordered the Dublin fire brigade to its aid with every available engine. He was attacked in Winston Churchill's victory broadcast on May 13, 1945, for his neutrality. De Valera gave his own side of the case from Radio Eireann three days later. After the Feb. 1948 elections, when De Valera's Fianna Fáil was returned as the strongest party but with a minority of the seats in the *dáil*, John Costello was elected *taoiseach*. De Valera, freed from office, left in March for the United States where he spoke in favour of a united Ireland and was made an honorary citizen of New York. In the following months he visited India and Australia, and in October opened a campaign in Great Britain for the ending of partition. The Costello coalition broke up early in 1951 after a dispute with the Roman Catholic hierarchy over a health scheme for mothers and children. In the elections that followed in May, Fianna Fáil improved its position slightly and in June De Valera again became *taoiseach* by 74 votes to 72. In October he went to Switzerland for an eye operation.

DE VALOIS, DAME NINETTE (DAME EDRIS CONNELL, *née* EDRIS STANNUS), British dancer, choreographer and director of ballet (b. Blessington, County Wicklow, Ireland, June 6, 1898), studied dancing under Enrico Cecchetti, made her debut in the 1914 pantomime at the Lyceum theatre, London, and appeared there each year until 1919. In 1918 she was *première danseuse* of Sir Thomas Beecham's British National Opera company, and in the following year was *prima ballerina* for the royal opera season at Covent Garden, London, where she again appeared in 1928. Meanwhile, after a brief interlude as a musical comedy dancer, she toured (1923-26) with the Diaghilev Russian ballet. During this period she also appeared with Léonide Massine and Lydia Lopokova at Covent Garden and (in 1926) as partner to Anton Dolin at the Coliseum theatre, London, and elsewhere. She then founded her own ballet school and in 1926 became director of ballet at the Abbey theatre, Dublin; at this time she also produced ballet at the Cambridge Festival theatre. Her first choreographic work, *Job* (to Vaughan Williams' music), was performed by the Camargo Ballet society, a body formed in 1930 to encourage young English dancers and choreographers. Ninette de Valois had already produced ballet in connection with the opera and Shakespeare at Lilian Baylis' Old Vic theatre (1928-30); when, in 1931, the Vic-Wells ballet was formed as a distinct company and took over the Camargo society's assets, she became its director.

Its successor, the Sadler's Wells ballet, became under her direction the leading ballet company of western Europe; her junior company, the Sadler's Wells Theatre ballet, continued the tradition of the Camargo society. On May 15, 1950, at Sadler's Wells, she danced at a single performance of *Wedding Bouquet*, to celebrate the 21st anniversary of the companies. In the 1951 New Year Honours, Ninette de Valois was created a dame commander of the Order of the British Empire. Her choreographic works also included *The Rake's Progress*, *Checkmate*, *Don Quixote* and *The Prospect Before Us*; the last ballet was revived at Sadler's Wells on Feb. 13, 1951, with Robert Helpmann in the leading role, and on Nov. 21 *Don Quixote* was again successfully performed at Covent Garden. In 1937 she published *Invitation to the Ballet*.

DIABETES. The increase in death rates from diabetes in the United States from 1900 onward had slackened by 1930 and almost came to a halt in 1940. This occurred despite the advancing age at death of the population, from 35.2 to 59.2 years between 1900 and 1949. The crude rate in 1940 was 26.6 per 100,000 and in 1948, the last year of statistics based on the fifth revision of the census, 26.4. With the sixth revision of the census in 1949, using the doctor's opinion as to chief cause of death, the rate was 16.9. The halt in incidence could be explained by earlier recognition and better treatment of all cases, both mild and severe, so that at death diabetes was overlooked as a cause.

Evidence that control of diabetes is possible accumulated. (1) The Quarter Century Victory medal had, by the close of 1951, been awarded to 29 diabetics who, after having proved diabetes for 25 years, were free from complications. These patients had undergone meticulous control during their early years. (2) Among 200 patients who had contracted diabetes as children, reported by Priscilla White, those who were nearly free from coma for more than 20 years exhibited few or no complications in the arteries and eyes, in contrast to a high incidence when coma, indicating poor control, was frequent. (3) Among 202 patients whose diabetes began later (ages 15 to 30 years) and had lasted 10 to 29 years, Howard F. Root, Richard H. Sinden and Ralph Zanca found those with poor control had far more advanced arteriosclerosis, retinal and kidney lesions than those under better control. (4) Among 247 patients with onset of diabetes between infancy and 30 years of age, and in existence for 10 to 34 years, a clear relationship was evident between the various degrees of control of diabetes and the development of calcified vessels, retinitis and albuminuria.

F. C. Young produced diabetes in adult dogs and cats by injections of anterior pituitary extract, but in puppies and kittens these same extracts or pure crystalline growth hormone exerted instead a growth-promoting effect and no diabetes, proving a single agent stimulated growth in the immature young but development of diabetes in the old. However, some puppies, persistently injected for long periods, when they became adults and ceased to grow, developed diabetes. The rat, even when old, responds to the anterior pituitary extract by growing and never becomes diabetic. Maintenance of lactation in the cow parallels its diabetogenic activity in the dog. Growth and diabetes induced by growth hormone represent an alternative effect of the same general metabolic stimulus. Young supported this thesis by metabolic balances which showed increased deposition of protein and increased oxidation of fat. Glucose oxidation was inhibited. A level of pituitary activity appropriate for growth or lactation might exist, but with no physiological outlet available, diabetes could result. Before the onset of their diabetes some women gave a history of having had exceptionally large babies. Was this the result of excessive activity of the maternal pituitary which led later to the development of diabetes in the mother?

Priscilla White observed excessively rapid growth in some diabetic children preceding diabetes.

The extractable insulin of the pancreas was measured by Gerald A. Wrenshall at autopsy in diabetic and non-diabetic human subjects (Gerald A. Wrenshall, W. S. Hartcroft, A. Bogoch and R. C. Ritchie, "Extractable Insulin and Histology of Pancreas: A Study of Diabetic and Non-Diabetic Cases," presented at a meeting of the American Diabetes association at Atlantic city, New Jersey, June 1951). In non-diabetic adults concentration of extractable insulin of the pancreas increased progressively with decreasing pancreas weight, those subjects with high concentrations being characteristically obese and having fatty yet small pancreases. The extractable insulin of the pancreas after death by coma was found to be very low and likewise low in diabetics whose diabetes was discovered during the growth period, but much higher in subjects who had reached full stature prior to onset. (See also ENDOCRINOLOGY.) (E. P. J.)

DIAMONDS. The demand for rough diamonds, both gem and industrial, was even stronger in 1951 than in 1950 and the sales of rough diamonds during the year reached a value of £65,057,965. This total was a new record and exceeded the 1950 figures of £50,967,041 by £14,090,924. Table I shows sales of rough diamonds from 1946.

TABLE I. DIAMOND SALES, 1946-51
(£ million)

	1946	1947	1948	1949	1950	1951
Gem	26.1	20.1	26.8	19.9	38.3	46.8
Industrial	3.5	4.4	11.3	8.5	12.6	18.3
Total	29.6	24.5	38.1	28.4	50.9	65.1

Production was maintained and in some cases expanded in the diamond properties of the Union of South Africa, South-West Africa, the Belgian Congo, Angola, Tanganyika, the Gold Coast, Sierra Leone, French Equatorial Africa, Brazil and British Guiana. A high rate of production at the Premier mine near Pretoria was achieved as a result of its re-equipment with the most modern machinery. During the year, a diamond weighing 160 carats, of the finest blue-white colour and best quality, valued at £80,000, was discovered in the alluvial diggings in South-West Africa.

From London, the world centre of the diamond trade, diamonds continued to be sold to manufacturers and primary distributors in the United Kingdom, the United States, Belgium, the Netherlands, France, Israel, Australia and Canada. Figures of diamond imports into the United States are given in Table II.

TABLE II. U.S. DIAMOND IMPORTS, 1950-51

	1950		1951*	
	Carats	Value	Carats	Value
Uncut gems	976,134	\$45,665,212	627,752	\$29,870,620
Cut gems	492,671	\$58,524,902	322,879	\$41,284,329
Industrial	10,835,596	\$35,062,104	6,767,555	\$24,403,994

Considerable quantities of industrial diamonds were purchased by the U.S. government for its stockpile of strategic war materials.

The range of uses to which industrial diamonds are put was increasing and a well-equipped research laboratory in Johannesburg continued the work of discovering new uses for industrial diamonds and of improving existing appli-

cations. An important part of the work carried out in the laboratory was that of conducting experiments which would result in an increase in the efficiency of diamond recovery at the mines. Industrial diamonds were vital to the rearmament effort of the North Atlantic Treaty organization as they were used for all precision work including wire-drawing. Many drilling and boring operations now relied on diamonds, and mining engineers found that drill crowns set with diamonds were more economical and effective than the crowns previously used. Industrial diamonds were being used in the manufacture of such diverse products as hearing-aids, musical instruments, plastic goods, electrical lamps and other appliances, and telephones. Such processes as paper-making, glass-cutting and engraving and many others, relied at some stage of their production on the use of industrial diamonds. (See also GEMS.) (X.)

DIETETICS: see NUTRITION.

DISASTERS. During 1951 loss of life and property took place in the following disasters:

Air

- Jan. 27 Near Tarquinia, Italy. Fourteen people died when an Italian air liner was wrecked by lightning.
- Jan. 28 Eastern Formosa. An R.A.F. Sunderland flying boat crashed, killing all 16 on board.
- Jan. 31 Between Reykjavik and Vestmannaeyja, Iceland. An Iceland Airways Dakota aircraft crashed in a blizzard, all 20 people aboard being killed.
- Jan. 31 Near Victoria beach, Terceira Island, Azores. A Portuguese army plane crashed into the sea, everybody aboard being killed.
- Feb. 3 Mount Cameroon, Nigeria. Twenty-three passengers and the crew of six were killed when an Air France Brazzaville-Paris air liner crashed.
- Mar. 2 Sioux City, Iowa. Sixteen people were killed when a DC-3 air liner crashed while landing in a snowstorm.
- Mar. 11 Hong Kong. A Thai Skymaster aircraft crashed on Parker mountain. All 24 aboard were killed.
- Mar. 23 Atlantic ocean. A U.S. air force C-124 Globemaster with 53 aboard disappeared while flying across the Atlantic. Wreckage found on March 28 showed that there were no survivors.
- April 6 Santa Ynez mountains, California. Twenty-two died when a transport plane crashed.

Firemen directing hoses on to burning oil tanks at Avonmouth in Sept. 1951.

The scene at Ford station, Sussex, on Aug. 5, 1951, when a Brighton-Portsmouth train ran into the rear of a local train. Seven persons were killed.

- April 8 Charleston, West Virginia. A U.S. air force plane carrying a military funeral escort of 21 men crashed into a fog-shrouded hill, killing 19.
- April 9 Off Hong Kong. A Siamese airways air liner crashed; all 16 aboard were killed.
- April 25 Off Key West, Florida. Forty-three people died in the mid-air collision of a Cuban air liner and a U.S. navy trainer.
- April 27 Central Oklahoma. The pilot of an F-51 fighter and 12 of the crew of a B-36 bomber were killed in a mid-air collision.
- May 6 Albuquerque, New Mexico. Twenty-three members of the crew of a B-36 bomber died when the plane crashed and exploded while trying to land during a sandstorm.
- June 22 Near Sanoye, Liberia. A Pan-American airways Constellation air liner crashed in the jungle, killing the 40 people aboard.
- June 30 Rocky Mountain National park, Colorado. All 50 people aboard a Skymaster air liner were killed when the plane struck a mountain peak.
- July 12 Near Aracaju, northern Brazil. Thirty-two people died when a Brazilian air liner crashed into a hill.
- July 21 Near Juneau, Alaska. A Canadian Pacific air liner bound for Tokyo with a crew of seven and 31 passengers, mostly U.S. military personnel, disappeared.
- Aug. 20 Fort Dix, New Jersey. Two U.S. air force officers and 11 infantrymen were killed when a jet training plane plunged into a bivouac area.
- Aug. 24 Near Oakland, California. Fifty people aboard a DC-6B air liner were killed when the plane crashed near the airport.
- Sept. 12 Western Mediterranean, between the Balearic Islands and Spain. A French air liner flying from Toulouse to Oran was wrecked by an explosion while in flight.
- Sept. 15 Flager, Colorado. Nineteen people were killed when an aircraft taking part in an air circus crashed among the spectators.
- Oct. 15 Near Kokstad, Cape Province, South Africa. A South African airways Dakota aircraft crashed into a mountainside and its 13 passengers and crew of 4 were killed.
- Oct. 17 Near Nanaimo, British Columbia. A flying-boat crashed, killing 23 people.
- Oct. 27 Near Flores, Guatemala. Twenty-seven Guatemalans were killed when an army plane crashed in the jungle.
- Nov. 13 Mont Dore, Puy de Dôme, France. Thirty-six U.S. soldiers, airmen, women and children were killed when a U.S.A.F. Flying Boxcar hospital plane crashed.
- Nov. 21 Calcutta, India. An Indian air liner crashed at Dum Dum airport, killing 16.
- Dec. 6 Near Lages airfield, Azores. A U.S. B-29 bomber crashed, killing all 16 occupants.
- Dec. 16 Elizabeth, New Jersey. An air liner carrying 56 holiday-makers to Florida crashed after an engine had caught fire; all aboard were killed.
- Dec. 22 Near Tehran, Persia. An Egyptian air liner crashed, killing the crew of five and 15 passengers.
- Dec. 29 Salamanca, New York. An air liner crashed on a flight from Pittsburgh to Buffalo; 26 people died; 14 survived.
- Dec. 30 Near Phoenix, Arizona. A U.S.A.F. C-47 transport plane crashed, killing all 28 aboard, of whom 19 were West Point cadets on Christmas vacation.

Fires and Explosions

- Jan. 3 Near Chimbote, Peru. A delayed dynamite explosion set off an avalanche that killed at least 132 railway workers.
- Jan. 30 Hoquiam, Washington state. Fire that swept through a rest home killed 20 elderly people.
- April 27 Gibraltar. The ammunition ship "Bedenharn" blew up, killing seven people and doing considerable damage to the dockyard and town.
- May 13 Kano, northern Nigeria. In a fire that destroyed a cinema, 317 persons died.
- May 17 Nha Trang, Vietnam, Indochina. Fifty-five French soldiers died and 130 were injured when a French landing-ship was wrecked by an explosion and fire.
- May 19 Kushiro, Japan. Thirty-five children and three adults were killed when fire spread throughout a cinema.
- May 29 Easington, County Durham. An explosion at Easington colliery killed 82 miners and a rescue worker.
- June 3 Hikone, Japan. A fire that began when cinematograph film caught fire caused the deaths of 23 girl silk-factory workers.
- June 15 Montreal. Thirty-five people, mostly elderly women, died in a fire at the Hospice de Sainte Cunegonde.
- July 5 Treptow, eastern Berlin. A pleasure steamer crowded with school children exploded and caught fire; about 30 children were killed.
- July 7 Haifnen-la-Bassée, Nord, France. Seventeen people were killed, three missing and 13 seriously injured in an explosion that wrecked a munitions factory.
- Aug. 20 Pulau Bukom, Singapore. Two explosions, followed by fire, aboard the British tanker "Dromus," killed 22 men and injured 30.
- Sept. 6 Avonmouth docks, Bristol. Twelve million gallons of oil were destroyed in an oil-tank fire following an explosion in which two men were killed.
- Nov. 23 Copenhagen. Fire and explosion wrecked the Holmen naval station, killing 16 men and wounding 79.
- Nov. 24 Bristol. Eleven people were killed and 15 injured in a petrol explosion at a garage.
- Dec. 21 West Frankfort, Illinois. An explosion at the New Orient bituminous coal mine killed 119 miners.
- Dec. 22 Tijuana, Mexico. Forty-one people were killed in a fire at a children's Christmas party.

Natural

- Jan. 3 French Morocco. Floods that swept the Rharb plain killed 71 people; 60 were missing.
- Jan. 4 Comoro Island. A two-day tornado caused the deaths of about 500 people.
- Jan. 18-21 Mount Lamington, New Guinea. About 4,000 Papuans and 34 Europeans were reported to have been killed when this volcano erupted.
- Jan. 19-24 Swiss, Italian, Austrian and French Alps. Avalanches killed about 300 people in this period.
- May 6-7 El Salvador. Earthquakes killed at least 375 people and left 25,000 homeless, the greatest losses occurring in Jucuapa and Chinameca.
- May 12 Faridpur district, East Bengal, Pakistan. It was reported that 200 people had been killed or injured in a tornado.
- July 12-14 Western Japan. Floods caused the deaths of nearly 100 people and left more than 200 injured and 200 missing.
- July 11-25 Kansas, Oklahoma, Missouri and Illinois. In flooding of the Mississippi and its tributaries, damage of property valued at over \$870 million was incurred, nearly 200,000 people left their homes and about 1 million ac. of fertile land were covered with mud and debris. The number of dead was believed to be about 40.
- Aug. 3 Potosi, Nicaragua. Earthquakes split a dormant volcano, releasing water in its crater which inundated this small coastal port, causing heavy casualties and severe damage.
- Aug. 6-7 Manchuria. Floods were reported by Mukden radio (Aug. 20) to have killed 1,800 persons; 3,000 others were missing.
- Aug. 13 Changra Vilayet, Turkey. Earthquakes caused 54 deaths and injuries to 150 persons.
- Aug. 15-25 Jamaica and Mexico. A severe hurricane struck Jamaica,

The "Flying Enterprise," photographed from the air on Jan. 9, 1952, after the towline had parted from the tug "Turmoil."

- later sweeping on to Tampico, Mexico. Great damage was done and 151 people killed and many injured. The total number of deaths in Jamaica and Mexico, including those of 42 people drowned when a dam burst at Cardenas, was 260.
- Sept. 26-27 Pescadores Islands and Formosa. More than 100 people were killed in a typhoon.
- Oct. 4 Southern Japan. It was reported that 448 people had been killed in a typhoon.
- Oct. 22-23 Formosa. Earthquakes killed 32 people.
- Nov. Persia. It was reported that floods near the Caspian sea had demolished the village of Roodsar: 225 people had been killed or were missing.
- Nov. 1-20 Po river valley, Italy. Three weeks of storms and floods were reported to have caused the deaths of 150 people and to have made about 150,000 homeless.
- Nov. 21 Philippine Islands. Typhoon killed about 60.
- Dec. 4-13 Camiguin Island, Philippines. Repeated eruptions of Mount Hibok-Hibok killed at least 248 persons; about 500 were missing and about 20,000 homeless.
- Dec. 10-13 Central Philippines. Reports indicated that 724 people had been killed in typhoons.
- Dec. 25 Epi Island, New Hebrides. It was reported that a hurricane had killed 100 people.
- Rail**
- Feb. 6 Woodbridge, New Jersey. Eighty-five people were killed and about 500 were injured when a suburban train was derailed on a temporary trestle.
- April 24 Yokohama, Japan. A broken power cable fell on to the roof of a train, and the ensuing fires caused the deaths of 104 people; 66 were injured.
- June 8 Near Nova Iguassu, Brazil. Fifty-four people were killed when a train struck a petrol lorry near this town, 20 mi. from Rio de Janeiro.
- Aug. 5 Ford, Sussex. A train loaded with bank-holiday travellers collided with a stationary one; nine passengers were killed and 46 injured.
- Aug. 24 Sary-sur-Nied, Moselle, France. Twenty people were killed and more than 30 were injured when a Basle-Calais train rammed a Frankfort-Paris train standing outside a station.
- Sept. 21 Weedon, Northamptonshire. The 8.20 a.m. Liverpool-Euston express crashed over an embankment; 15 passengers were killed or died later as a result of the accident.
- Sept. 24 Langenwang, Styria, Austria. Twenty people were killed and more than 50 injured when a Vienna-Rome express crashed into a stationary goods train.
- Nov. 12 Near Evanston, Wyoming. Two trans-continental passenger trains collided in a snowstorm, killing at least 16 passengers and injuring many.
- Nov. 25 Near Woodstock, Alabama. Sixteen people were killed and 70 were injured when two passenger trains collided head-on.
- Dec. 17 Near Carneiro, Ceara state, Brazil. Fifty-three people were killed when a train was derailed.
- Road**
- Feb. 24 Horsham, Victoria, Australia. Eleven people were killed when a train crashed into a bus at a level crossing.
- June 19 Harsching, Bavaria. Fifteen Roman Catholic students, returning from a pilgrimage, were killed when the lorry in which they were travelling was struck by a train.
- Aug. 13 Near Bolzano, Italy. Thirty-four people were drowned when a bus plunged into the Resia lake.
- Nov. 15 Po valley, eastern Italy. Thirty-three people were drowned when a lorry carrying flood refugees was swept away.
- Dec. 4 Chatham, England. Twenty-three boys were killed when a bus ran into the back of a Royal Marine cadet column.
- Sea**
- Feb. 21 Off the Dutch coast. It was reported that the wreckage of the French fishing vessel "Duc de Normandie" had been found; 22 of her crew of 24 had been drowned.
- April 16 Sixteen miles N. of Alderney, Channel Islands. The British submarine "Affray," which had a crew of 75, failed to surface after a diving exercise.
- April 20 Gulf of Mexico, off Morgan City, Louisiana. Two tankers collided in a dense fog, and in resultant fires 40 seamen of the two vessels were killed.
- May 14 Off Cape Henry, Virginia. Thirty-six lives were lost in a collision between the U.S. navy seaplane tender "Valcour" and the collier "Thomas Tracy."
- May 25 Newport, Rhode Island. Nineteen U.S. naval personnel were drowned when a launch capsized during a storm.
- June 16 Off Cedros Island, Mexico. A cannery fishing boat with 37 people aboard capsized in high seas; 23 people were drowned.
- Aug. 12 Dogger Bank, North Sea. The Norwegian freighter "Bess" capsized, shortly after it had been abandoned in heavy seas; nine survivors were picked up, two bodies were recovered and 20 other people were reported missing and presumed lost.
- Sept. 1 Off Montauk Point, Long Island, New York. The captain and 45 passengers aboard the fishing boat "Pelican" were drowned and 19 were saved, when the boat capsized.
- Oct. 5 Off Cape Hatteras, North Carolina. Seventeen seamen died and six were rescued when a U.S. ore ship broke in two.
- Dec. 15 Perak river, near Mannong, Malaya. Eighteen people were drowned when a motor-boat struck a submerged object and capsized.
- Dec. 28-31 Channel and Atlantic coasts of Europe. At least 40 seamen from five ships were drowned during severe gales.
- Dec. 28-Jan. 10, 1952. Atlantic and English Channel. After the U.S. passenger-freighter "Flying Enterprise" (6,700 tons) had developed a severe list she was abandoned 100 mi. S.W. of Land's End (Dec. 28) by all but her Danish-American master, Capt. Kurt Karlsen. On Jan. 4 K. R. Dancy, mate of the British tug "Turmoil" leaped aboard and the tug took the freighter in tow (Jan. 5). On Jan. 9, however, the tow parted and on Jan. 10 the "Flying Enterprise" sank about 40 mi. from Falmouth, Karlsen and Dancy being picked up. Karlsen was later awarded the Lloyd's Silver medal and was appointed an officer of the Danish Order of Danebrog.
- Miscellaneous**
- Jan. 31 Belfast. Eighteen shipyard workers were killed when a gangway from a ship to the shore collapsed.
- Feb. 11-17 Calcutta. Smallpox killed 462 people in the city.
- April 1 Indore, Central India. Thirty-eight women and four children were killed when a house collapsed.
- Aug. Pont-Saint-Esprit, Gard, France. In an outbreak of poisoning from bread made of contaminated rye, and in later smaller outbreaks, 200 people became ill or temporarily insane and 5 died.
- Sept. 16 Campinos, Brazil. The roof of a cinema collapsed, killing 28 children.
- Oct. 28 Atlanta, Georgia. Thirty-six people died and 200 were taken seriously ill after they had drunk "hooch" made from wood alcohol.
- DISPLACED PERSONS:** *see* REFUGEES.
- DISTILLING:** *see* SPIRITS.
- DIVORCE:** *see* MARRIAGE AND DIVORCE.

DOCKS AND HARBOURS. The third annual report of the British Transport commission, covering 1950, was published in July 1951 and recorded a deficit of £54,847, before any contribution to central charges had been made, in the operation of docks, harbours and wharves, as against a deficit of £824,053 in 1949. The financial improvement was due in large measure to increased charges to shipowners and traders which came into force in May 1950; but economies in expenditure and increased traffic played their part. Southampton docks were taken over by the Docks and Inland Waterways executive in 1950, and Plymouth docks were transferred in 1951. The principal works authorized during 1950 were estimated to cost £1,182,500. Traffic totals (including coastwise) for 1950 were better than those for 1949: imports amounted to 23,291,000 tons (as compared with 22,372,000 tons in 1949); and exports, 36,991,000 tons (36,947,000 tons in 1949). The outward figure (coastwise and foreign) for 1950 included 28,996,000 tons of coal and coke—about 2 million tons less than in 1949. In 1951, the British Transport commission appointed consultants to advise on the reconstruction of war-damaged facilities at Hull, including the Riverside quay and the south side of the Albert dock. Owing to the expansion of a refinery at Grange-mouth, Stirling, a new oil port was established at Finnart, Loch Long, on the west coast, and connected to Grange-mouth by a 50-mi. pipeline; the new port would accommodate tankers of at least 28,000 tons, deadweight. At Hartlepool, Co. Durham, the commission approved a £330,000 scheme for the reconstruction of the lightering berth at the old harbour. At Barry, Glamorgan, the old commercial dry dock was leased to a firm of ship-repairers and was reconstructed to give an overall length of 940 ft. capable of sub-division into two compartments 445 ft. and 475 ft. A four-year plan costing £525,000 was approved for new works at Cardiff, Swansea and Newport, the main object being to replace steam pumping and hydraulic plant by electrical equipment.

National Dock Labour Board. The National Dock Labour board published its fourth annual report and statement of accounts for the calendar year 1950 on March 31, 1951. The labour force averaged 75,264 men throughout the year, voluntary absenteeism amounting to 1.5%. The average surplus of labour over the year was 6,895; but in June there were serious shortages at Liverpool. At the end of the year, traffic reached an abnormal peak; there were heavy labour shortages in a number of ports and many vessels were seriously delayed. The average number of men on daily transfer was 2,565, and the daily average of non-registered workers who were given jobs was 112. There was one major dispute during 1950: it occurred in London and lasted from April 19 to April 29. Weekly earnings averaged £8 12s. 10d., as compared with £8 8s. 11d. in 1949. Generally, employers continued to pay 15% as a surcharge on total wages to finance the board's activities; but the surcharge on coastwise dockers' wages was dropped to 10% as from July 1, 1950, and the surcharge on weekly workers' wages continued unchanged at 5%. As from Jan. 1, 1951, these percentages were lowered to 13.5, 9 and 3 respectively. The board's excess of income over expenditure in 1950 was £861,558; and after bringing forward an excess from 1949 and making appropriations to the general reserve, general welfare and capital reserve funds, the balance carried forward to 1951 was £692,881. At the end of 1950, the balance on general reserve fund stood at £1,254,073.

Liverpool. In the programme of war damage replacement, two more transit sheds were completed and a third nearly finished; two miles of sheds had now been built since the end of World War II. Work continued on the new entrance for the Langton-Canada system of docks, and with the

construction of sheds, the widening of quays, the construction of dock walls and the diversion of sewers. The first phase of work on the new iron-ore berth at Bidston dock, Birkenhead, was almost completed.

London. The Port of London Authority made considerable progress in the provision of additional accommodation for both shipping and goods. Most of the work consisted of restoration and improvement of damaged property, but a substantial advance was made on major schemes involving new work at the India, Millwall and London docks. There was a large increase in export traffic involving heavy expenditure on new cargo-handling equipment. In its report for the year ended March 31, 1951, the authority recorded that the work of the port had been seriously delayed on several occasions during the year by unofficial strikes. A proposal was made to construct a new fish quay at Billingsgate. At Hay's Wharf a new pair of dock gates, welded and electrically operated, was fitted. Work proceeded on a new Shell jetty at Thames Haven designed to accommodate tankers up to 38,000 deadweight tons.

Manchester. Further progress was made in the building of a new £15 million oil refinery and the construction of the oil dock to be opened in 1952.

Southampton. Fawley oil refinery, costing over £37 million and the largest in Europe, was opened. The main terminal accommodated four tankers of up to 39,000 tons deadweight and a maximum length of about 700 ft. requiring a minimum depth of water of 34 ft. The harbour board made plans to establish a new control station, equipped with radar and radio-telephone, at the top of Calshot castle. The largest dredging programme ever undertaken in the port was completed; it necessitated the removal of 3.5 million cu.yd. of spoil and included work in the western approach, at Calshot spit and in the reaches upstream of Fawley.

Sunderland. Further progress was made with two widening schemes in the lower reaches of the River Wear and also with improvements to the junction and east side quay at Hendon dock. A firm of ship-repairers lengthened one of their dry docks from 515 ft. to 565 ft. and made a substantial advance with the construction of their new 675-ft. dry dock and the extension of their quay. Several firms of shipbuilders modernized their yards and increased their productive capacity.

Tyne. It was announced that the port authority proposed to begin work at an early date upon two new coal shipping staiths at Whitehill point. The cost would be about £600,000 and the berths would have 30 ft. of water. Northumberland dock would be made tidal. Work proceeded on the extension of Sutherland quay and the installation of mechanical unloading plant to accommodate and discharge ore carriers of 20,000 tons capacity. A firm of ship-repairers was constructing a 700-ft. dry dock and a repairing quay having 25 ft. minimum depth alongside.

Australia. The commonwealth government completed plans for the construction of a new wharf, with an area of 80,000 sq.ft., at Port Darwin. At Sydney, one of the largest cranes in the world was brought into use. Its maximum capacity was 250 tons and its working radius 178 ft.; it carried a 6-ton travelling crane on top of its main arm. At Melbourne, the mechanization of cargo-handling was further developed by the addition of five new wharf cranes, and of new mobile cranes and fork-lift trucks; progress also continued on the scheme for new docks to provide 28 additional ocean berths.

Belgian Congo. At Stanleyville, terminal of the main navigable channel of the Congo river, work continued on the enlargement of quays, the construction of marshalling yards, the erection of cranes and the mechanization of cargo handling.

Belgium. Work commenced at Zeebrugge on a new terminal for the train-ferry service from Harwich; this was designed to avoid passing through the lock and thus to reduce the round-voyage time by about two hours.

Burma. The Economic Co-operation administration announced in Washington that they would allocate about £535,000 towards the rehabilitation of the port of Rangoon. The Burmese government proposed that the outports of Akyab, Bassein, Mergui, Moulmein and Tavoy should be rebuilt and modernized; the works contemplated included mechanized rice-loading facilities, the installation of mooring and channel buoys, new pontoon jetties, extensive dredging and the reconstruction of pilots' quarters.

France. Further progress was made in the development of Gennevilliers, the new port of Paris. At Dunkirk, plans were made for the modernization of a shipyard to permit the construction of vessels up to 58,000 tons deadweight with a beam of over 100 ft.

French West Africa. The new port of Abidjan, Ivory Coast, was officially opened on Feb. 6, 1951. The railway from the interior had its terminus there and the port replaced the open roadsteads of Port Bouet and Grand Bassam. The work included the completion of a canal, three km. long, to connect the 70-mi. lagoon of Abidjan with the sea, and sea protection works consisting of two piers of rubble masonry and weighted fascine-work to prevent sand encroachment. Plans were made to add inner piers, wharves, a goods station, bonded warehouses, quays and cranes; it was anticipated that 850,000 tons of cargo would be handled during each year.

Gold Coast. At Takoradi, progress was made in the construction of two deep-water quays for general cargo and one for coal, an import jetty for oil and an export jetty for bauxite, and a mass-concrete quay for timber exports.

India. The government of India accepted an outline plan for the future development of the port of Madras. The principal features were a new tidal dock comprising ten berths with two-storey transit sheds, warehouses, sidings and a marshalling yard. A model was built and the siltation problem was further studied but it was recognized that the principal construction work must await a solution of the financial difficulties. It was announced that the construction of the main harbour works at Kandlax would begin shortly.

Northern Ireland. The Newry Port Harbour trust decided to construct reclamation banks, carry out dredging, replace a timber jetty and construct a new wharf and berth. At Belfast, the reconstruction of the northern portion of Queen's quay was completed so that coal cargoes could be received, and progress was made with works at the east quay of Abercorn basin, the Musgrave shipyard delivery wharf, the Spencer dock entrance and dock roads.

Republic of Ireland. At Dublin, the port and docks board placed a contract for the construction of a graving dock costing over £890,000 to accommodate ships up to 18,000 tons deadweight; the work would take three years. This work formed part of a £4 million improvement scheme which also included deepening the bar to 30 ft. minimum, additional storage, a new ocean pier, new jetties and an oil zone. At Cork, progress was made on a £1 million programme to include dredging, quay improvements and river widening. At Waterford, work proceeded on a new wharf and the erection of cranes, general repairs to quays and preparations for the construction of a new transit shed. At Limerick, a £300,000 scheme for deepening the dock was approved. New works and repair operations also went forward at Fenit (Co. Kerry), Sligo, Dundalk (Co. Louth), Arklow (Co. Wicklow), Wicklow and Killybegs (Co. Donegal).

Israel. It was decided to begin work on a new lighter port at the mouth of the Kishon river in Haifa bay to relieve

traffic in Haifa port and to provide storage for goods in transit and a free zone.

Kenya. At Mombasa, work proceeded on the ten-year development plan, the first stage being the provision of an open stacking-ground behind the deepwater quay; more storage accommodation would then be built followed by additional deepwater berths.

Lebanon. At Beirut, the Trans-Arabian pipeline project came into operation and the first consignment of oil from the new Sidon terminal reached Great Britain early in 1951. The whole scheme cost the dollar equivalent of over £75 million. The oil originated from the Saudi Arabian fields in the region of the Persian gulf. The tanker roadsteads at Beirut covered an area measuring about 2 mi. by 1½ mi. and there were four off-shore loading berths having depths of 50-55 ft.

Morocco. At Agadir, a three-year scheme for the fivefold enlargement of the harbour was begun. The work would include the building of a mile-long breakwater and the dredging of an area of 75 ac.

Nigeria. At Lagos harbour, work began upon extensions to the Apapa wharf at an estimated cost of £2.5 million. Six new berths and four transit sheds figured among the facilities to be provided; the work was expected to be completed by April 1955.

North Borneo. Tenders were invited for the development and reconstruction of wharves at Jesselton, Labuan and Sandakan.

Pakistan. The government decided to open an inland port near Chalna on the River Pussur to handle ocean-going vessels for the export of jute and tea and the import of coal and grain. Further progress was made with developments at Chittagong where work began, under a contract valued at £2.25 million, on seven berths for ships of up to 10,000 tons each.

Panama. It was announced that a free port zone would shortly be established at Colón.

Poland. It was announced from Poland that the wreck of the German battle cruiser "Gneisenau" had been raised at Gdynia, thus clearing the main entrance of that port.

Portuguese East Africa. At Quelimane, work began on new wharves to accommodate ocean shipping for which no alongside berths formerly existed. The low-water depth in the berths would be about 21 ft. and the new facilities would be available in 1952. The pier for the new port of Nacala was completed and plans for the deep-water wharf were settled.

Sarawak. Borings were made at the site of the new port at Gunong Ayer.

Tanganyika. At Dar-es-Salaam, work began on the construction of three deep-water berths, two to the order of the Railways and Harbours administration and a third to the order of the Belgian government. At Mtwara, it was decided to continue, on a reduced scale, with the construction of the new port (otherwise known as Mikindani) in order to hurry on the development of the Southern Province. The amended scheme included two deep-water berths and general improvement of the port.

Thailand. A contract valued at \$4.4 million was placed for the deepening of the channel in the Chao Phya Menam river which connects Bangkok with the Gulf of Siam. The object was to eliminate barge work and thus reduce the cost of exporting rice.

Turkey. The government decided to proceed at an early date to carry out port developments, costing 7.3 million Turkish pounds, at Istanbul, Izmir, Samsun, Iskenderun and various Black sea ports.

Venezuela. Work began on a scheme to double the capacity of the Cardon refinery, northern Venezuela. By 1952, the

annual output of oil products would be raised from 3.5 million tons to 7 million tons. (A. H. J. B.)

United States. In 1951 construction was executed on 150 regular river and harbour projects by the U.S. army corps of engineers; of this number 23 were completed. Maintenance was performed on a total of 330 projects. During the fiscal year ended June 30, 1951, \$186,142,500 of federal funds was expended for new work and maintenance of river and navigation projects and inland and coastal harbours. The Rivers and Harbours act of 1951, including supplementary appropriations, provided \$192,657,613 for maintenance and improvement of U.S. rivers and harbours. Of this total \$125,192,613 was for new construction work on 43 projects in 29 states, the District of Columbia and Alaska. The act specified that no planning could be undertaken or continued unless certified by the president or necessary to defence. No new construction could be initiated except the Dalles lock and dam, Oregon and Washington, and Old Hickory lock and dam, Tennessee, both multi-purpose projects providing hydro-electric power.

At the end of 1951 there were 686 authorized investigations in advanced stages of completion. (G. Hb.)

At Baltimore, work was continued on a new ore pier, designed to receive 2,400 tons an hour, as an addition to four existing piers. Expansion of facilities at the port of Arecibo (Puerto Rico) was begun, the principal improvement being the construction of a 402-ft. bulkhead to facilitate the loading of sugar, molasses, pineapples and other products.

Canada. During 1951 about \$1.4 million was spent to widen ship channels in the Fraser river, and add more dykes and dams to the existing \$11 million Fraser valley dyke water control system. The irrigation gates of the 2,530-ft. earth dam (the largest in Canada) on the St. Mary river near Lethbridge were opened on July 16, bringing the river water to 500,000 ac. Eight major ports were administered by the national harbour board and of these six had a bigger volume of traffic in 1951 than in 1950. The government was active in the preparation of a complex shield of seaward defences around the strategic harbours. Plans went forward for a multi-million dollar expansion and improvement of Toronto harbour, in anticipation of the deepening of the St. Lawrence seaway. (See also CANALS AND INLAND WATERWAYS.) (C. Cy.)

See G. de Joly, Ch. Laroche, P. H. Watier and A. de Rouville, *Travaux Maritimes*, vol. iii, *Ouvrages Intérieurs et Outillage des Ports* (Paris, 1951); P. Ford and J. A. Bound, *Coastwise Shipping and The Small Ports* (Oxford, 1951).

DOMINICA: see WINDWARD ISLANDS.

DOMINICAN REPUBLIC. West Indian republic covering the eastern two-thirds of the island of Hispaniola or Haiti. Area: 19,129 sq. mi. Pop.: (1935 census) 1,479,417; (Aug. 6, 1951, census) 2,121,000. Racial distribution is estimated at 13% white, 68% *mestizo* and mulatto and 19% Negro. Language: Spanish. Religion: Roman Catholic. Capital: Ciudad Trujillo (pop., 1951 census, 181,000). President, Generalissimo Rafael Leónidas Trujillo y Molina.

History. The sugar production of the Dominican Republic in 1951 was the greatest on record—nearly 530,000 metric tons. All of it was sold to Great Britain, the normal market for Dominican sugar, at prices above those of 1950. British purchases of Dominican products were again substantially greater in value than those of the United States. The government took the occasion of the coming into effect on June 6 of the tariff changes agreed to at Torquay, viz., to emphasize all of the concessions made to the United States and to stress the merit of a modest increase in the Dominican quota in the U.S. sugar market. The turnover of goods in domestic trade continued to slow down, as in 1950, but unemployment did not increase. The price level and wage level did not change

perceptibly. The government continued to build up its cash resources, but established no increases in tax rates.

The seizure on July 26 of a Guatemalan vessel, en route from Cuba to Guatemala, by a Dominican naval vessel gave rise to renewed recriminations between the Dominican Republic, which imprisoned the crew and passengers as enemy elements, and Cuba and Guatemala. The Guatemalans were released, but the Cubans were sentenced to 20 years' imprisonment. Nevertheless, on Christmas day 1951, President Trujillo released the Cubans also, and lessened the tension with Cuba. Relations with Haiti were more cordial than for some years. (C. MCG.)

Education. Schools (1951): elementary and secondary, state 2,749, state-aided 107, private 95; total pupils 262,499; university, students 2,254, teaching staff 172.

Agriculture. In the 1950-51 season, a record total of 587,343 short tons of sugar and 25,813,275 gal. of blackstrap molasses was produced. Other crops: coffee 326,899 bags (132 lb. each), cacao (34,000 short tons), tobacco (1949-50) 24,200 short tons, bananas (1949-50) 5,237,168 stems. Livestock (1950): pigs 1,140,000, goats 340,000, cattle (1949) 602,000, horses 140,000, mules and asses 126,000.

Foreign Trade. Exports in 1950 were valued at \$83,500,000, imports \$43,000,000. Leading exports: sugar (47%), cacao (17%), coffee (15%) and tobacco (6%). Leading customers: U.S. (44%) and U.K. (42%). Leading suppliers: U.S. (73%), Netherlands Antilles (5%), U.K. (2%) and Germany (2%).

Transport and Communications. Railways: state 170 mi., and 650 mi. operated mainly by the sugar companies. Roads (1949): surfaced highway 500 mi., other roads 2,500. Motor vehicles (1948): cars 3,124, commercial 2,390.

Finance. Budget (pesos, 1950 actual): revenue 96,590,000, expenditure 90,881,000; (1951 est.) balance at \$74,606,200. Internal debt (June 30, 1951): \$21,261,000; no external debt. Notes in circulation (Sept. 30, 1951): 29,510,000 pesos. Gold reserve: U.S. \$8,100,000. Monetary unit: *peso* officially pegged at par with the U.S. dollar. (J. W. Mw.)

DONATIONS AND BEQUESTS. The National Thanksgiving fund, launched by the lord mayor of London on March 21, 1950, in gratitude for food gifts from the Commonwealth and the United States, was officially closed in July 1951. Sir Denys Lowson, lord mayor of London, announced, on July 27, that of the original target of £2 million only £800,000 had been raised. The following first allocations were made from the fund: £600,000 for halls of residence for women and married students and U.S. men students; £100,000 to London house for maintenance; and £35,000 to The Burn, the parallel establishment in Scotland to London house. These allocations enabled the original purposes of the fund to be carried out.

After the loss, on April 19, 1951, of the submarine "Affray," the mayors of Chatham, Rochester and Gillingham launched a relief fund which amounted to £177,492 by December. Eton college launched a building appeal for £1 million; by the middle of November £390,000 had been raised. In August an appeal for £150,000 was launched to endow a chair of Commonwealth studies at Cambridge university as a permanent memorial to Jan Christiaan Smuts.

The Nathan committee on charitable trusts, set up in Jan. 1950, continued to receive evidence during 1951; the creation of the committee was welcomed in the sixth report of the Nuffield foundation, published in June 1951. In August the vice chancellor of the University of Cambridge announced that the trust had granted £37,000 to the university. At the same time a grant of \$82,500 was announced from the Rockefeller foundation. The Carnegie United Kingdom trust had granted £4,065,555 since its creation in 1913. Of this sum more than £1.5 million had been expended on library services. The Pilgrim trust, in its 20th annual report issued in May, forecast "a somewhat less liberal grant policy." In 1950, the trust had made grants of £143,823.

Lord Dulverton gave £42,000 to Bristol university to restore the great hall, which had been destroyed in an air raid in World War II. An art collector, H. S. Reitlinger,

bequeathed his art collection for the benefit of the public. The National gallery, London, received two paintings bequeathed by Mrs. H. C. Tarleton and P. M. Turner. George Bernard Shaw, who died on Nov. 2, 1950, left £367,233. After making other bequests he directed that the residue be left on trust for an inquiry into a new alphabet. A first payment of £1,020,322 duty was paid on the estate of the 10th Duke of Devonshire who died on Nov. 26, 1950. He left £796,473. Sir G. Holcroft, who died on April 19, 1951, left £1,176,313; duty paid was £910,822.

In the United States, G. M. Moffett, who died on Dec. 22, 1951, left approximately \$20 million. He bequeathed the bulk of his fortune to the Whitehall foundation, an organization which helps students through U.S. colleges. Mrs. H. S. A. H. G. Wilks, who died on Feb. 5, 1951, left her fortune of more than \$100 million to charity, principally to churches, hospitals and colleges. The Ford foundation, created in 1950, granted \$1,309,500 to the "free university" of Berlin. The trust also created a fund "for the advancement of education" with an interim budget of \$7,154,000.

DRAWING AND ENGRAVING. In many of the numerous art exhibitions held in Great Britain during the Festival year of 1951, drawings occupied at least a modest share of the available wall space. At the Tate gallery, London, in January, a memorial exhibition of the drawings and lithographs of Randolph Schwabe (1885-1948; Slade professor, London university) emphasized the increasing rarity

of fine, academic drawing as an end in itself. Drawing as a means to an end was exemplified in a selection of Henry Moore's studies which was shown at the Tate gallery in May as a subordinate feature of an exhibition of his sculpture. They consisted of experimental projections of shapes and spaces on paper as preliminaries to final statements in solid form. Later in the year, a fairly comprehensive collection of Pablo Picasso's drawings was assembled in London at the Institute of Contemporary Arts as a tribute to his 70th birthday. The exhibition was a retrospective survey, beginning with astonishing specimens of his talent as a boy and ending with assured and characteristic drawings of the period after World War II. The works shown included directly drawn sketches, abstract arrangements, imaginative effusions, pictorial allegories, studies for paintings and light-hearted, witty scribbles. It was not only a survey of Picasso's development and accomplishment as a draughtsman, but it was, at the same time, a disclosure of the source of major influences which continued to affect the practice and teaching of drawing.

The once clearly indicated aesthetic boundary between drawing for its own sake and drawing for reproduction seemed to have lost much of its definition by 1951. Artists had now discarded the deliberately formal manner of drawing for reproduction in favour of a free and spontaneous approach. This new informality was not only in keeping with contemporary idioms, it was also consistent with the essentially personal character of good drawing. Moreover, standards of reproduction by line, half-tone and lithographic methods were now so consistently reliable that drawings

"Rue St. Antoine, Paris," by Ronald Searle, who illustrated "Paris Sketchbook" by Kaye Webb, published in 1951 by Saturn Press.

were often translated into print without much loss of their original quality.

In France, outstanding examples of book illustration were André Marchand's rich lithographs for André Gide's *Nourritures Terrestres*. In Norway, there were Guy Krohg's pleasing illustrations to a translation of the *Daphnis and Chloë* of Longus, Ridley Borchgrevink's strong and convincing drawings for his own book *Animal Tracks and Wild Honey* and Knut Rumohr's woodcuts for Alexander Kieland's *Working People*. In Great Britain, there were Ronald Searle's irresistible line drawings for Kaye Webb's *Paris Sketch Book* and delightful and engaging work by Edward Ardizzone for Maurice Gorham's *Londoners and Showmen and Suckers*.

At the Victoria and Albert museum, London, in November, the British Broadcasting corporation showed a group of original designs that had been reproduced in their publications. The exhibition provided encouraging evidence that many good drawings by such able artists as Susan Einzig, Pearl Falconer, Lynton Lamb, Eric Fraser and Leonard Rosoman were seen by a very large public.

Copper engraving, etchings and dry-points, save for desultory revivals, were not much in evidence. Wood engraving was practised widely and prints of good design and craftsmanship were produced in Italy, the Netherlands, Germany and Great Britain; but wood engravings had a more limited currency as individual hand-made prints than as illustrations produced on high-speed presses. In lithography, there was considerable activity. Drawing on stone was to some extent supplanted by drawing on zinc plates and some highly interesting experimental work was done on new plastic surfaces which offered intriguing possibilities of different techniques and treatments. DYESTUFFS. International. French, Swiss and German technical organizations convened a meeting in 1951 to consider international agreement on methods of testing colour fastness and expressing the results; delegates from 14 countries attended. Nine countries assented to proposals put forward at the final session but others, including Great Britain, reserved a decision. The British observers called attention to the fact that the International Standards organization was already studying the problem. A sub-committee on colour fastness had been set up when the textile committee of I.S.O. met in England in 1949. Later, the committee held a further meeting and consideration was again given to colour fastness. Considerable progress was made and agreement in principle was reached on about a dozen tests.

Great Britain. Like many other British industries the dyestuff industry was threatened by the sulphur shortage in the earlier part of the year. But the cuts in United States exports proved less drastic than had been feared and certain economies in the use of sulphur were effected. Nevertheless, the sulphur situation and tightness in the supplies of various coal-tar chemicals made trading in dyestuffs during much of 1951 more difficult than it had been. Later in the year, however, the lull in trade brought about some easing of the situation.

British contributions to dyestuff chemistry were featured at the Festival of Britain South Bank exhibition. The Society of Dyers and Colourists held a conference on "The Tinctorial Arts Today"; it was emphasized that the rapid development of synthetic fibres, completely different in composition and properties from the older textile materials, would call for great efforts from the dyestuff industry.

France. A court of appeal in Paris ordered the restoration to the former owners of that part of the shareholding of Francolor, the French dyestuffs combine, which had been held by I. G. Farbenindustrie, the German dyestuffs combine, during World War II and subsequently sequestered by the French government. The three leading French chemical and dyestuffs companies, Kuhlmann, Saint Denis and Saint Clair-du-Rhône, were forcibly amalgamated in 1941 into a new corporation known as Francolor. I. G. Farbenindustrie took a 51% participation and in exchange for their property the French received shares in I. G. Farben stock, representing 1% of that organization's capital. Following the Paris court order a new company, Cie. Française des Matières Colorantes, was formed to take over the management of the assets of Francolor.

Germany. The Allied High commission in Germany issued its final plan for the splitting up of the former I. G. Farbenindustrie. There were to be three large groups, together with a number of smaller ones producing a variety of goods including dyes. Considerable interest was taken in the introduction in Germany of new members of the important copperphthalocyanine group of colours.

India. The newly formed Dyestuff Manufacturers' Association of India urged the government to stop issuing import licences for certain classes of colours which could be made in India in sufficient quantity to meet demands. More important still was the plea that the authorities should issue import licences for adequate quantities of intermediate chemicals and remove the excise duties on certain raw materials. It was also suggested that the government itself might manufacture intermediates in the ordnance factories.

(L. E. Ms.)

United States. The volume of production and sales of U.S. dyestuffs in 1951 maintained essentially the high level of 1950. The needs of the civilian economy were fulfilled with some minor exceptions. Through technological advances in dyeing and finishing and the increased use of vat and other fast colours, the quality of dyed merchandise was better than ever before. Defence requirements accounted for 80% of the consumption of such vat colours as khaki, brown and olive. Despite increases in the costs of raw materials and labour the prices of most dyes remained at the 1950 parity. Despite aggressive competition from foreign dye-exporting countries, credit restrictions and other economic and political factors, the U.S. industry exported about the same volume as in 1950.

Several new synthetic fibres possessing unusual characteristics were introduced commercially. They could be used alone or combined with those of natural origin to form unique fabric constructions. These new fibres and their resultant blends imposed numerous technical difficulties of colouration which were largely overcome through the combined knowledge of the textile and chemical industries. (A. G. BR.)

EAR, NOSE AND THROAT, DISEASES OF.

Deafness in Children. It had always been difficult to evaluate and diagnose deafness in children under two years of age and in young patients with psychogenic deafness. Two techniques of experimental psychology, however, had been employed to determine hearing functions by the application and observation of conditioned reflexes. The first method is primarily designed to determine if any hearing impairment exists in an infant. The basic idea is to associate the ringing of a bell with feeding. Eventually, the child with normal hearing will develop a conditioned reflex and start to suck and smack its lips when it hears the bell. The child with a hearing impairment will make no such sign, thus indicating that he cannot hear the bell.

The second method, developed by John E. Bordley and William G. Hardy, also employs the conditioned reflex but is

a broader and more definitive technique. The investigators record the changes in skin resistance which follow a mild electric shock. A warning sound is produced four or five seconds before the electric shock is given. The young child may be conditioned quickly to develop skin resistance changes after the warning sound in anticipation of the coming shock. When the child begins to respond regularly to the warning signal alone, intensity of tone is gradually diminished until the threshold is reached. A child conditioned to one tone is thereafter conditioned to all tones audible to him.

The Fenestration Operation. In the light of knowledge in 1951, no one could definitely predict the outcome of the fenestration operation as far as complete restoration of hearing was concerned. In some cases the patient's hearing had improved; in many, hearing had returned to the pre-operative level; while in others, hearing retrogressed. The fenestration operation had rehabilitated great numbers of hard of hearing, but, no matter how successful, it did not re-establish normal hearing. (M. S. ER.)

The Common Cold and Antihistamines. It was suggested by Edmund P. Fowler, Jr., in 1951, that colds involve overaction of either the sympathetic or the parasympathetic nervous system of the nose. Since histamine or histamine-like substances are involved in the autonomic balance, antihistamines sometimes interfere in its action enough to produce symptomatic relief. First, they produce on the peripheral vessels an effect of a stimulant, like epinephrine, and perhaps secondarily they act as a paralyzing agent, like procaine or atropine. It also seemed possible that the antihistamines must have some effect on secondary processes developing after physical or psychic stimuli which tend to predispose to the infectious type of cold in some people.

Observations indicated that a specific hypersensitivity and imbalance of the involuntary nervous system is fundamental in the allergic type of cold. Histamine or histamine-like substances appear to contribute to the symptomatology. The allergic individual is, apparently, the constitutional type in whom there is a comparatively reduced functioning of the sympathetic response from his autonomic nervous system with overaction of the parasympathetic response. This can be due either to lack of adequate opposition or from sensitization to parasympathetic stimuli. Either could be influenced by antihistamines which were shown to have adrenergic (sympathomimetic) as well as atropine-like properties.

Whether one could assume that the person who develops the infectious cold does so from overaction of the sympathetic side of his autonomic nervous system was not clear. The theory was presented that when and if the antihistamines have an effect on the infectious cold they block secondary parasympathetic tissue responses in the psychic or physical stimuli stages of certain colds and so produce symptomatic relief. They may also reduce the action of histamine as it is released by infection in the early invasive stages of a mild cold. The adrenergic action of antihistamines may tend to make the later stages of a cold worse. Whether there is also eventual destruction of the cilia and changes in the cells of the mucous membranes, as with ephedrine and other nose drops, had not been proved by the end of 1951, nor had increased permeability of the epithelium to bacteria and to viruses. Laboratory experiments indicated that therapeutic doses of the common antihistamines would not be of value in well-developed infectious colds. They might give some help in the early stages of the infectious cold or such colds in which an allergic factor is present.

Maintenance of the Airway: Tracheotomy. When a patient becomes too ill to expel secretions from his throat and lungs, tracheotomy should be done without delay. Drainage is thereby made more effective than with a nasal catheter, and the larynx is not injured. Life is often saved, and even in

hopeless cases the airway is cleared and broncho-pneumonia is prevented. The trachea was opened by Roy W. Dickman and Ivan D. Baronofsky in 14 surgical cases involving such grave conditions as severe head injury, chest wounds with fractured ribs, hemothorax or tension pneumo-thorax, third-degree burn from inhalation of hot fumes, ruptured ulcer with peritonitis, and separation of an esophageal suture after the resection for carcinoma. If secretions collect and air flow is reduced, mucus rapidly becomes more viscid, clogging the cilia and dulling the cough reflex. As more air is cut off, cyanosis, cerebral anoxia, and stupor develop, still further deadening the response to bronchial irritation.

The unconscious patient, originally free of pulmonary symptoms, is too often suffocated by the sticky mucoid accumulation. If the subject is stuporous, a nasal catheter drainage requires a laryngologist rather than a nurse, and the procedure may be necessary every 30 min. for several days. The larynx is inevitably damaged as a result. Even in the deepest coma, a catheter inserted through the tracheotomy tube arouses a vigorous cough reflex which empties the small bronchi and bronchioles. Both air and sputum are passed more easily than through the larynx, and the patient's respiratory efforts are much reduced. (F. LR.)

EAST AFRICA HIGH COMMISSION. The commission was established in 1948 to administer the public utilities and other services, including research, of common concern to the territories of Kenya, Tanganyika and Uganda. It has power to legislate, with the advice and consent of the East Africa Central Legislative Assembly, on any of these matters. The assembly consists of 7 *ex-officio*, 3 nominated and 13 unofficial members, including Indian and African representatives.

The commission's organization for desert locust control went into action in 1950 and its teams were operating throughout 1951 in the territories in the "Horn of Africa." The threatened invasion of Kenya was reduced to quite small proportions, but the outbreak to the north was widespread and showed little sign of abating. The East African Agriculture and Forestry Research organization at Muguga was opened by James Griffiths, secretary of state for the colonies, on May 26. Its capital cost (£366,000) was met from colonial development and welfare funds. It had a staff of 22 engaged on fundamental research. Work continued on the building of three new deep-water berths at Dar-es-Salaam and on expanding port facilities there and at Mtwara. Surveys were being conducted for the extension of the railway which runs inland from Mtwara and of the Uganda railway westward to the Kilembe copper deposits in the Ruwenzori mountains. Also under the commission's aegis was the proposed rail link between east and central Africa. Three possible routes had been selected and in May the firm of Sir Alexander Gibb and Partners, with their American associates, started the second series of surveys designed to provide the basic economic information which would determine the final choice. (See also KENYA; TANGANYIKA; UGANDA.) (K. G. B.)

EASTERN EUROPEAN ECONOMIC PLANNING. Further progress in the industrialization of Soviet-dominated Europe was made during 1951, which was the third year of long-term planning in Bulgaria and Czechoslovakia,

the second in Hungary and Poland and the first in Rumania. In Albania and Eastern Germany new five-year plans were announced. Meanwhile the Bulgarian, Czechoslovak, Hungarian and Polish plans were speeded up by substantial increases of capital investment and the augmented output of heavy industry.

Bulgaria. Speaking at Sofia on Sept. 8, Viko Chervenkov, the prime minister, stated that Bulgaria, a purely agricultural country, was being turned into an industrial country. No reference was made to the metallurgical plant, lead and zinc foundry and copper ore smelters which in 1948 had been planned to start production in 1951. The completion, however, on Nov. 5 of the Stalin Chemical combine and the Chervenkov thermo-electric power station at the new town of Dimitrovgrad was vigorously hailed in the press. According to the five-year plan, operation of these two enterprises had been scheduled to start at the end of 1955, but the Bulgarian government was instructed to postpone other projects and concentrate on the two plants at Dimitrovgrad. Production at the Stalin Chemical combine, engaged in extracting nitrogen from air and producing calcium nitrate and other chemicals, was planned to be 70,000 metric tons a year. The Chervenkov power station alone was expected to produce a 40% increase of electric power, the major part of which would be consumed by the Stalin combine. During the year 15 ships of various tonnage, the first to be built in Bulgaria, were completed at new shipbuilding yards at Varna (renamed Stalin).

Anton Yugov, minister of heavy industry, stated that by the end of 1951 industrial output had reached 97.3% of the level envisaged by the plan for 1953 and that "in its basic branches" the five-year plan had been completed in three years. Bulgarian industry had produced almost four times as much in 1951 as in 1939. In 1952 over 52% of a budget expenditure of 344,800 million levas was earmarked for investment in the national economy. At the official exchange rate this represented £221.5 million, or over £30 per head of the population. Incidentally, in a Communist country the national budget comprises revenue and expenditure of all nationalized enterprises.

Czechoslovakia. Klement Gottwald, president of the republic, announced on Dec. 31 that industrial output during 1951 had been 12.7% higher than in 1950 and two-thirds higher than in 1937; in Slovakia particularly the increase was 19.2% compared with 1950 and more than treble compared with 1937. Heavy industry production increased between 1950 and 1951 by 14.3% (in Slovakia by 36.4%). The president's announcement was in fact a declaration of failure rather than of achievement, for at the beginning of 1951 the Prague government had decided that the year's increase in industrial output, planned originally as 16%, should be 22%.

The percentages revealed by Gottwald indicated that general industrial production in 1951 was 8% below the target and even lower in heavy machinery and coal. In the summer Václav Nosek, minister of the interior, admitted that only 47,000 metric tons of coal were produced daily of the 55,000 tons essential to the Czechoslovak economy, and he castigated the miners of the Ostrava-Karvina basin, responsible for over four-fifths of the coal production, for failing to fulfil their promises. As the situation in the coal mines did not improve, Antonín Zápotocký, the prime minister, in December attributed the workers' resistance to the influence of the Slanský clique and of reactionary *émigrés*, but the simple explanation probably was that original enthusiasm was undermined by the constant lowering of living standards. Nor was any comfort to be derived from statements that, expressed in 1937 prices, the national income amounted in 1951 to Kč. 78,100 million compared with

Kč. 56,500 million in 1937, that the total increase was 38.2% and, per head of population, amounted to 68%. This increase was immediately reinvested, and less food and clothing than in 1937 were purchasable by actual wages.

The construction of new steelworks at Kunčice near Moravská Ostrava was well advanced: at the end of the year the first blast furnace and open hearth steel plant were completed. Another steelworks, temporarily described as "Hu-Ko" (Hutiový kombinát), was being built in eastern Slovakia, south of Košice. During 1951 Kč. 105,000 million (65.6% of the budget expenditure) was invested in the national economy, averaging at the official exchange rate £60 per head of the population, compared with the United Kingdom's similar investment averaging £40 per head in 1950.

Hungary. The National Assembly on May 17 passed a revised five-year plan under which far greater importance was to be assigned to industry than had been originally intended. Ernő Gerő, chairman of the Council of National Economy, proposing the revision, explained that Hungary, an agrarian country before World War II, would become in consequence "a country of steel and machines." Zoltán Vás, chairman of the State Planning commission, seconding, stated that the people's needs exceeded the scale of the original plan. The total capital investment was increased from 50,900 million forints to 85,000 million forints, that is, at the official exchange rate, to £2,576 million, or £280 per head of population in five years. The volume of all industrial production by 1954 was to represent 310% of that of 1949, instead of 186.4% as originally planned. Objectives for chemical and electrical industries were doubled, those for heavy engineering trebled.

Industrial production in 1951 was 30.1% higher than in 1950 and 210.9% higher than in 1938. Capital investment in 1951 was 44.8% greater than in 1950 when the total budget expenditure was F. 17,454 million. The budget expenditure in 1952 was increased to F. 42,481 million out of which more than a half was earmarked for investment in the national economy.

Projects under the five-year plan included power stations at Inota, in the Veszprém country and at Tisza Lök, an aluminium foundry at Szent-Gal, a new blast furnace at the Diósgyőr iron and steel works and, most important of all, the Stalin Iron and Steel works of Dunapentele. These works were first planned at Mohács, which, however, was considered too near to the Yugoslav frontier. Dunapentele was renamed Sztalinváros (Hungarian "Stalingrad") on Nov. 7 when the already completed blast furnace and open-hearth steel plant produced the first tons of steel.

Poland. During the first year of the Polish six-year plan its objectives were considerably increased. Industrial production was to be 158.3% higher by 1955 than in 1949, instead of the 90% increase originally planned; steel production was to be doubled to 4.6 million metric tons, while coal output was to be raised almost two-fifths to 100 million tons. The total capital investment for the whole plan was increased from Zł. 120,000 million to Zł. 185,000 million, or £16,518 million at the official exchange rate.

Industrial production in 1951 was 24.4% higher than in 1950, while the corresponding increase in the preceding year had been 30.8%. Although neither the mining nor the metallurgical industries reached their objectives for 1951, the increases recorded were 5% for coal, 11% for crude oil, 18% for electric power, 6% for pig iron, 11% for steel, 7% for cement and 18% for calcium nitrate.

Many important projects were completed during the year. On June 12 new steelworks were inaugurated at Częstochowa which were to produce 300,000 tons of steel in the first year, increasing in three years to 1.1 million tons. On Aug. 12 fires were lit in what was described as "the biggest and

most up-to-date blast furnace in Europe": the capacity of this addition to the Kościuszko iron and steel works at Chorzów, Silesia, was 250,000 tons of pig iron yearly. In November production started at a motor-car factory at Żerań, near Warsaw, and a lorry factory at Lublin. A synthetic oil plant at Dwory, near Oświęcim, began activity, and an oil refinery at Trzebinia, near Cracow, was considerably enlarged. During the year the construction continued of Nowa Huta, the new iron and steel works near Cracow which was planned to be the largest in Poland.

On Dec. 31 President Bolesław Bierut stated that a total of Zł. 25,000 million had been spent in 1951 on new buildings, machinery and plant, or 1,000 zlotys (£89 6s.) per head of the population. Such a sum represented about two months' average wage.

Rumania. The first five-year plan was put into effect on Jan. 1. The total capital investment was to be 1,330,000 million lei (£3,090 million or £195 a head), including L. 678,300 million (51%) earmarked for industry. By 1955 Rumania was to produce 4,700 million kwh. of electricity, 10 million metric tons of oil, 8.5 million tons of coal and 1,250,000 tons of steel.

Construction began of the Lenin hydro-electric power station at Bicaz, in northern Rumania, the yearly production capacity of which was to be 1,000 million kwh., and a reservoir being built on the upper Bistrița river would enable the irrigation of some 300,000 ha. of arable land. Two other hydro-electric and three thermo-electric power stations were in construction. As Rumania produced in 1950 only about 5,350,000 tons of crude oil, the 10-million-ton objective seemed difficult to attain in view of the fact that in 1934, its best year, the Prahova valley field yielded only 8,467,000 tons of crude oil. However, in 1948, production of oil started in a new field near Târgu-Ocna, in the Trotuș and Tasleu valleys in Moldavia. Soviet experts pronounced this region as rich in oil as central Rumania north of Ploești. A pipeline from the refineries of this city to the port of Reni, on the Soviet side of the lower Danube, carried eastwards the major part of Ploești production. Output in the new Trotuș-Tasleu field increased eightfold in 1950 compared with 1948 and during 1951 ten times more wells were sunk than the preceding year. New blast furnaces were being built at iron and steel works at Hunedoara, Transylvania, and a metallurgical plant at Reșița, in the Banat, was being enlarged. Industrial production in 1951 was 23.0% higher than in 1950, 22.1% more crude oil being produced, 19.4% more coal, 17% more electric power, 20.9% more iron ore and 15.7% more steel.

Albania. Addressing the central committee of the Albanian (Communist) Party of Labour, at Tirana, on Sept. 24, on the first five-year plan for 1951-55, Enver Hoxha, the prime minister, said that under the two-year plan 1949-50 a total of 3,497.9 million leks had been invested in the national economy. At the exchange rate of Rb. 1 = L. 12.50, this sum represented Rb. 279.8 million (about £25 million or £20 *per capita*). The budget for 1951 estimated a revenue of L. 9,500 million and an expenditure of L. 9,100 million, of which L. 3,607 million were to be invested in the national economy.

In 1950 the output of the mineral-extracting industry was 274.4% higher than in 1938 and that of the processing industry 301.1% higher. As a result of the two-year plan a Stalin textile works was completed at Fieri with a planned yearly production of 20 million m. of cotton fabric which would supply all the country's needs. A Lenin hydro-electric power station started production, supplying the capital with ten times more electricity and four times more water than in 1949. Production of crude oil in 1950 at Kuçovë and elsewhere was estimated at 150,000 metric tons. The crude oil

was conveyed by pipeline to the port of Valona (Vlonë) and thence by Soviet tankers to refineries at Constanța or Batumi.

Projects under the five-year plan included the construction of an oil refinery at Valona, of a metallurgical combine, and a hydro-electric power station on the river Mati with a yearly production capacity of 100 million kwh.

Eastern Germany. Walter Ulbricht, deputy premier, in a speech to the People's Chamber on Oct. 31, presented a five-year plan according to which metallurgical enterprises in Eastern Germany were to produce 253.6% more by 1955 than in 1950, the precision-instrument and optical industries 238.9% more, the chemical industry 204.4%, and the building material industry 209.8% more. The total value of industrial production was to increase between 1950 and 1955 from DM.(Ost.) 23,400 million to DM.(Ost.) 45,000 million. Objectives for 1955 included the production of 2 million tons of pig iron and 3.1 million tons of steel. The shipyards of Rostock, Warnemünde and Stralsund were to build 59 ocean-going steamers, 81 smaller vessels and many fishing boats. The first blast furnace of a new iron and steel combine at Fürstenberg-on-Oder started production on Sept. 19.

Satellites' Role in Soviet Economy. From such details as have been summarized above emerges a picture of strenuous effort and notable achievement, of great sacrifices and puzzling haste. That it was possible to exhort such vast contributions to capital investment out of nations who were never rich was sufficiently remarkable. To express these amounts in pounds sterling at official exchange rates must obviously be misleading because for the satellite countries as well as for the Soviet Union the rates were artificially high and much above the real purchasing value of the respective currencies. Even with this reservation, capital investments were on an important scale and the results achieved spoke for themselves.

The Soviet government's interest in the industrialization of its European satellites, and the whole purpose of eastern European planning, as directed by the Council of Mutual Economic Aid, was not to raise but to lower the satellites' standards of living to the Soviet level, not to increase the economic independence of the subjected nations but to create as great a dependence on Soviet raw materials, finance and distribution machinery as possible. The hastening of industrialization in Soviet-dominated Europe involved no political dangers, for the decision to start the long-term plans had been taken, probably at the end of 1948 when all Soviet hopes of seizing Western Germany without war had faded, when the Communist-controlled régimes were strong enough and sufficiently purged of national-deviationist elements to eliminate any such threat. As the Ruhr remained under the control of the west, it was imperative to build up an "eastern Ruhr." The Donets industrial basin was too far behind the Iron Curtain, which Soviet strategists regarded as a potential front. The Soviet railway system was inadequate and already overworked.

SATELLITES' ROLE IN SOVIET ECONOMY (1951)

Countries	Coal (Million metric tons)	Lignite (Million metric tons)	Crude Oil ('000 metric tons)	Electricity (Million kwh.)	Crude Steel ('000 metric tons)
Poland	81.7	5	194	10,380	2,775
Czechoslovakia	17.2	28	60	9,100	3,300
Eastern Germany	2.5	132	—	21,080	1,750
Hungary	1.1	12	660	2,300	1,200
Rumania	2.9	3	6,530	1,100	600
Bulgaria	0.3	4	—	1,000	—
Total satellite contribution	105.7	184	7,444	44,960	9,625
Soviet production	159.7*	—	42,112	98,838	31,740

* As Soviet coal production included lignite or brown coal, the table includes lignite also in the satellites' production. It was not known what coefficient was used for converting Soviet lignite into the thermic equivalent of coal. The coefficients used for the satellites are as follows (quantities of lignite per ton of coal): Eastern Germany 4.5, Czechoslovakia 1.7, other countries 3.

In 1951 for every 100 metric tons of coal produced by the Soviet Union, the European satellites added 56 tons to the pool, for every 100 kwh. of electric power generated in the Soviet Union the satellites produced 45.4 kwh., and for every 100 tons of steel they added 30.4 tons. The fact that between 1940 and 1950 industrial production in the Asian regions of the Soviet Union had increased and that, since 1945, militarily and industrially the Soviet government had assumed great responsibilities in Asia enhanced the economic importance of the European satellites. These alone were producing 110 tons of coal and 61 tons of steel for every 100 tons of each produced in the U.S.S.R. west of the Urals. To the 7,444,000-ton total of crude oil given in the table must be added 2.5 million tons extracted in the Soviet zone of Austria at Zistersdorf, 150,000 tons from Albania and of synthetic oil about 1 million tons produced in Eastern Germany and about 200,000 tons from Czechoslovakia. Thus, for every 100 tons of Soviet crude oil the satellites added 26.9 tons. Against 100 tons of crude oil produced by the European part of the Soviet Union alone they were contributing 51.3 tons. (See also COUNCIL FOR MUTUAL ECONOMIC AID.) (K. SM.)

EASTERN ORTHODOX CHURCHES: *see* ORTHODOX EASTERN CHURCHES.

ECONOMIC CO-OPERATION ADMINISTRATION (E.C.A.): *see* EUROPEAN RECOVERY PROGRAMME.

ECUADOR. Republic on the west coast of South America, straddling the equator, bounded N. and E. by Colombia and E. and S. by Peru. Area: 104,510 sq.mi. (including the Galápagos Islands, 3,029 sq.mi.). Pop. (1950 census prelim. fig.): 3,076,933, incl. c. 60% Indians, 30% *mestizos* (mixed blood), 9% whites, and 1% Negroes. Language: Spanish, but Indians speak Quechua and Jibaro. Religion: mainly Roman Catholic. Chief towns: Quito (cap., pop. 1947 census, 200,185); Guayaquil (the main port, 235,000); Cuenca (53,520). President, Galo Plaza Lasso (*q.v.*).

History. President Plaza's term was to expire in 1952, and political activity during 1951 in part reflected attempts of the political parties to prepare for the election of his successor. In June the Socialist party announced the formal termination of its opposition to the Plaza administration, paving the way for a broadened anti-Conservative coalition likely to emerge for the 1952 elections. Following the Socialists' action, Plaza reorganized his cabinet to include in it two Socialists, one Radical Liberal, one member of his own National Civic Democratic movement and four Independents.

In May President Harry S. Truman invited President Plaza to visit the United States, which he did from June 20 to 30. While he was in Washington, Plaza received assurances of additional U.S. aid in repairing the damage done by the disastrous earthquake of 1949, and also was given a pledge of more Point Four assistance for his country. In New York, Plaza addressed the U.N. general assembly. On the way back to Ecuador, he visited Mexico and Venezuela.

Ecuador's century-old border dispute with Peru was reopened in August when the Quito government charged that between Aug. 8 and 15 Peruvian forces launched ten small attacks against the Ecuadorian border province of Santiago-Zamora. The charges were denied at Lima, and the matter was referred to the United States, Argentina, Brazil and Chile, the four states which had mediated in the 1941 Peruvian-Ecuadorian border war. A mediation conference was called for Aug. 29; when that parley opened at Rio de Janeiro, the frontier skirmishes had ceased and no further action was deemed necessary.

The publication on March 2 of the preliminary figures of the 1950 census was an event of some importance for the republic: the statistics represented the initial result of the very first nation-wide census ever taken there since Ecuador established its independence in 1830. (G. I. B.)

Education. Primary schools (1949-50): state 2,544, pupils 225,571; municipal 390, pupils 34,222; private (mostly Roman Catholic) 357, pupils 61,138. Secondary, state 73, pupils 16,999; municipal 11, pupils 2,515; private 72, pupils 7,882. Institutions of higher education including four state universities (with 4,512 students), the Catholic university of Quito (164) and the polytechnical school (58).

Agriculture. Principal export crops (1950-51): cacao 30,707 short tons; coffee 210,000 bags (of 132 lb.); rice (paddy) 149,000 short tons. There were 1,600,000 cattle and 1,800,000 sheep in 1949.

Industry. The most important manufacturing activity was the textile industry, which produced cotton (principally), silk, woollen and rayon textiles. The manufacture of *toquilla* (Panama) hats was also important. Cement production in 1950 was 63,516 short tons. Mineral production (1950): gold 83,071 fine ounces; silver 273,200 fine ounces; copper 1,160,000 lb.; lead 496,000 lb.; petroleum 2,632,266 bbl.

Foreign Trade. (1950) Exports (Ecuadorian ports only) \$63.3 million, imports \$42.3 million. Chief exports: coffee (30%), cacao (29%), rice (13%) and bananas (12%). Leading customers: U.S. (55%), Italy (8%), Peru (8%). Leading suppliers: U.S. (67%), Belgium (7%), U.K. (6%), Germany (5%).

Transport and Communications. Railways (1949): 698 mi. Roads (1947): 1,591 mi. of main roads and 1,121 mi. of branch roads. In 1948 there were 2,921 cars, 4,245 lorries and 945 buses. Wireless sets (1951): 45,000.

Finance. Budget (million sucres): (1950 actual) revenue 679.6, expenditure 669.8; (1951 est.) balanced at 470; (1952 est.) balanced at 465. National debt (June 1951): foreign, U.S. \$42.6 million; internal, 141.9 million sucres. Currency circulation (Sept. 1951): 453 million sucres. Monetary unit: *sucre* with an official exchange rate of 37.80 sucres to the £ and 13.50 to the U.S. \$. (J. W. Mw.)

EDEN, (ROBERT) ANTHONY, British statesman (b. Windlestone hall, near Bishop Auckland, Durham, June 12, 1897), was educated at Eton college and, after service in World War I, at Christ Church, Oxford, where he took a first class honours degree in Oriental languages. He had won the M.C. with the King's Royal Rifle corps. In 1922 he unsuccessfully contested Spennymoor, Durham, but was elected to the House of Commons for Warwick and Leamington in 1923 and has held the seat since. From 1926 to 1929 he was parliamentary private secretary to Sir Austen Chamberlain, the foreign secretary, and in 1931 became under secretary of state for foreign affairs. He was made lord privy seal in 1934 and minister for League of Nations affairs a year later. After visiting Hitler in Berlin with Sir John Simon, then foreign secretary, he went on to Warsaw, Prague and Moscow to discuss an eastern European pact and was one of the first leading western statesmen to meet Joseph Stalin, on whom he was reported to have made a most favourable impression.

When Sir Samuel Hoare resigned over the Hoare-Laval pact in Dec. 1935, Eden became foreign secretary. He resigned in Feb. 1938 because of disagreement with Neville Chamberlain's policy towards Italy. On the outbreak of World War II Eden returned to the government as dominions secretary and when Winston Churchill became prime minister in 1940 he was appointed secretary of state for war. Later in 1940 he became foreign secretary. He led the British delegation to the San Francisco conference in 1945 which adopted the United Nations charter. He had become in 1942 leader of the House of Commons and the strain of the two appointments and the war years led to an illness in 1945 which prevented his taking part in the election campaign in his constituency, but he did make one broadcast for the Conservatives. After the election, in which the Conservatives were defeated, he became deputy leader of the opposition. He toured Canada, New Zealand, Australia, Malaya, India and Pakistan, Jan. 21-March 30, 1949, and visited Canada and the United States, Aug. 1-29, 1951. He was appointed deputy prime minister and foreign secretary in Churchill's

government of Oct. 1951. He had become chancellor of Birmingham university in 1945.

Eden's marriage to Beatrice Helen Beckett (1923) was dissolved in 1950. They had two sons of whom the elder, Simon, was killed while serving with the R.A.F. in Burma, 1945. (R. JA.)

EDINBURGH, DUKE OF (PRINCE PHILIP, DUKE OF EDINBURGH, EARL OF MERIONETH AND BARON GREENWICH, b. Corfu, Greece, June 10, 1921). The son of Prince Andrew of Greece, he was educated at a preparatory school at Cheam, Surrey, and at Kurt Hahn's school at Gordonstoun, Scotland. He joined the Royal Naval college, Dartmouth, as a cadet in 1939 and served throughout World War II in the Royal Navy. He was mentioned in despatches after the battle of Cape Matapan, 1941, and took part in the Sicily landings, 1943. He became a British subject in March 1947, renouncing his right of succession to the Greek throne—he was fifth in line—and his title. He took his mother's family name and was known as Lieutenant Philip Mountbatten. On July 9, 1947, his betrothal to Princess Elizabeth (*q.v.*), heiress presumptive to the British throne, was announced and they were married on Nov. 20. His titles and the right to the prefix "his royal highness" were conferred by King George VI on the eve of the wedding. He proceeded to share fully in the public life of the royal family, but resumed his seagoing naval career in Aug. 1949 as first lieutenant of the destroyer "Chequers" in the Mediterranean, and took command of the frigate "Magpie" in Sept. 1950. He was granted indefinite leave from the navy in July 1951. He was installed chancellor of the University of Wales (April 28, 1949), opened Gibraltar's new legislative council (Nov. 23, 1950) and inaugurated at Edinburgh, as

The Duke of Edinburgh, wearing the robes of doctor of laws of Edinburgh university, delivering his presidential address to the British Association for the Advancement of Science, Edinburgh, Aug. 8, 1951.

president, the 113th meeting of the British Association for the Advancement of Science on Aug. 8, 1951. In October and early November he toured Canada and visited Washington with Princess Elizabeth.

EDUCATION. United Kingdom. It would be idle to pretend that in a material sense 1951 was a good year in the field of education; the times were out of joint and educationists had to accustom themselves to the economic consequences of rearmament. The prevailing mood was not one of pessimism but rather that of Seneca, the good stoic, when he said: "The good things which belong to prosperity are to be wished, but the good things that belong to adversity are to be admired." It was a disappointment to educationists, however, that the new minister of education, Florence Horsbrugh, appointed in November, was excluded from the cabinet. If therefore the high hopes of 1944 had in some measure to be set aside, there was no slackening of the resolve to make the Education act of that year a living reality. Recognizing that for the present they had to be content with a restricted building programme, education authorities tended to seek progress in other directions. Now that there had been some definite experience of the operation of the act, it became possible to examine critically the trends and tendencies that it had stimulated and to consider whether development was along the right road. There was therefore a good deal of mental stock-taking and something like an audit of the educational balance sheet.

By recalling past achievement the Festival of Britain (*q.v.*) encouraged this reflective mood. There were educational exhibitions in various localities that recalled the history of schools during the previous 100 years and helped to distinguish the good and the bad in British educational tradition. Some of the earlier training colleges, such as those at Westminster and Derby, celebrated their centenaries. F. C. Pritchard's *Story of Westminster College, 1851-1951* was an essay on the theme "Respicere et Prospicere," recalling the past but in a modern spirit reaching out also to things that were to come. Bookshelves bore witness to this tendency to study the history of British education constructively; for among additions were books like W. F. Connell's *Educational Thought and Influence of Matthew Arnold*, which gave not only an admirable portrait of one of England's greatest educators but was also essentially a tract for the times. Another interesting addition was T. L. Jarman's *Landmarks in the History of Education*, for he concluded his scholarly retrospect with a sharp criticism of contemporary trends, deploring especially "the vast multiplication of committees." The year was also remarkable for the large number of retrospective lectures about education, and of these the most notable was that given by the Duke of Edinburgh as president of the British Association (*see* SOCIETIES, LEARNED AND PROFESSIONAL). Taking as his theme "The British Contribution to Science and Technology in the past hundred years," he focused attention on one of the great educational issues of the time. "Possibly the most vital factor affecting the industrial application of scientific research," he declared, "is the lack of a co-ordinated system of scientific and technological education in this country. Excellent as they are, the existing institutions, which have grown up to meet particular circumstances, do not produce anything like enough trained technologists to meet the urgent needs of scientific development in industry and to provide leaders for the future. It is to be hoped that the new and rather uncertain science of education will develop sufficiently quickly to point the way to a speedy solution of this problem." Among the more ambitious series of lectures arranged during the festival year was a course at King's college, London, during which leading educationists attempted a reevaluation of the great educators of the 19th

An aerial photograph of Marylands schools, the first pair of primary schools built in Adeyfield neighbourhood unit of the Hemel Hempstead new town, Hertfordshire.

century; a lecture by Sir Philip Morris in this series recalled the English tradition in education. It was felt that these many excursions into the past might strengthen the sense of perspective of those concerned with education and help them as they proceeded with the adaptation of the traditional British educational system to the requirements of modern society; for such a task the vision both of the present and the past was certainly needed. Educationists needed to prove all new theories and to hold fast to whatever was good in their heritage.

The Ministry of Education itself celebrated an anniversary, for it devoted its annual report to a survey of central administration in the period 1900-50. The Board of Education came into being in 1900, and this survey was a storehouse of historical information of a kind not otherwise readily obtainable. In his foreword the minister described it as "the story of a progressive partnership between the central department, the local education authorities and the teachers." This emphasis on the value of administration by partnership was expected to help to reassure those who feared that the immense powers assigned to the minister by the Education act of 1944 would lead to excessive direction and control; and it is good to find the minister rejoicing "that the department has traditionally valued the life of institutions more highly than system and has been zealous for the freedom of schools and teachers." If the Education act continued to be administered in a spirit of partnership for a generation, there was reasonable hope that a synthesis of order and liberty would become too firmly established to be smashed by a strong-willed, misguided minister.

It was appreciated in 1944 that one of the major problems would be that of finding the teachers: "It is not merely a larger number of teachers that will be required," R. A. Butler said at the time, "it depends almost entirely upon the quality of those who staff the schools whether the reforms proposed will be merely administrative reforms or whether they will, in practice, work out as real educational reforms." Later, in pursuance of the McNair report, a national advisory council was set up to keep a vigilant eye on this vital issue; and its first report on the "Training and Supply of Teachers" appeared during 1951. It was a document of only 23 pages, but its importance for the future of education could hardly be exaggerated. For it gave warning in plain words, supported by convincing facts and figures, of the urgent necessity for more teachers and for teachers suitably qualified

for the various branches of education. It expressed concern about standards, saying that it was at least doubtful whether the quality of the new entrants was "good enough to maintain the present level of quality of the whole body of graduate teachers in grammar schools." The shortage of well-qualified teachers of mathematics and science had become a source of anxiety in the industrial world; there was a growing realization by leaders of industry that unless the standard of teaching in these subjects was maintained in schools the country could not hope to hold its own in the technological field. There was thus an important dilemma in the disposition of technical personnel that had to be resolved; if industry and the scientific branches of government continued to absorb an undue share of the better mathematicians and scientists they would dry up the supply of them at the source, that is to say in the schools and technical colleges. It was to some extent a question of relative remuneration, and in that respect constituted a difficult problem for the Burnham committee.

The over-all impression was one of growing appreciation by parents of the value of good education. There was considerable evidence of an increasing interest in child development, and as a consequence of parents' associations and other media of information much knowledge about the psychology and physiology of childhood and adolescence, translated into simple terms, found its way into many homes. The long period of fuller employment from 1939 onwards enabled parents to think of their children's schooling without regard to the necessity for premature wage-earning. There had been some criticism of parents who withdrew their children from the secondary school before the completion of the normal course; the most impressive feature, however, was the demand for admission to the grammar schools. One reason for this was the delay, because of economic conditions, in the provision of the new secondary schools envisaged in the development plans prepared in compliance with the Education act, 1944. In areas where adequate alternatives were not yet available this competitive struggle for entry into the grammar schools was likely to continue. As a result, parents of the higher income groups, often at considerable sacrifice, were sending their children to independent schools, but for parents who could not afford this alternative there was no such solution of the dilemma. The absence of well-provided alternatives to the grammar school constituted for them a denial of the gospel of equality of opportunity so fervently proclaimed when the Education act was framed.

(W. O. L. S.)

Some of the 150 boys who started at Woolverstone Hall, near Ipswich, Suffolk, in Sept. 1951. The school, run by the London County council, opened in Sept. 1951 as a secondary boarding school. It would eventually accommodate 300 boys.

England and Wales. In Nov. 1950 the Durham County council threatened to dismiss any of its employees who were not members of a trade union or professional organization. The National Union of Teachers protested on behalf of its members and, failing to obtain satisfaction, in April 1951 made arrangements for them to resign from their posts. At this point the minister of education intervened with an order to the Durham authority to rescind its decision. For a while the council resisted, but finally gave way. In August, the teachers' representatives complained to the minister of education that the authority was still operating the "closed shop" policy by insisting that applications for special leave or extension of sick leave benefit should be submitted through the employee's organization.

The first report of the National Advisory Council on the Training and Supply of Teachers, published in May, showed the number of teachers in maintained and assisted primary and secondary schools in 1950 to be 209,000. It estimated that by 1954, owing to the increased birthrate, 229,500 would be required to maintain 1950 staffing standards. To meet the needs of the secondary schools, one-third of each year's output of arts and science graduates from the universities would be required. The supply of mathematics and science graduates had been insufficient, and there was a shortage of women teachers. In January the minister of education approved the Burnham committee's recommendations on salaries for teachers in maintained and aided schools. In March the first exchange of posts took place between a Ministry of Education official and a member of the staff of a local education authority (Birmingham). The exchange was for 12 months. In April the president, ex-president and

general secretary of the National Union of Teachers, at the invitation of the Soviet Teachers' union, paid a ten-day visit to the U.S.S.R.

In August the Ministry of Education issued the substance of two reports prepared by the Ministry of Education sub-committee of the Local Government Manpower committee. The sub-committee's main objective was to simplify the methods of departmental supervision, over local government activities, to reduce the need for and the extent of such supervision and to ensure that, wherever possible, a greater measure of responsibility rested on local authorities. The reports listed certain "key-points of control" necessary for the minister's performance of his duties, and the changes in existing procedure that would result from their establishment.

In April King George's Jubilee trust held a conference attended by almost all the leaders of the youth service in the United Kingdom to discuss the principles on which the service was based and improvement in its practice. It was announced in September that a small "pilot" experiment in the use of television in schools was being planned by the B.B.C. and the School Broadcasting council. This would be followed by a "main" experiment a year later. The number of schools registered as making regular use of school broadcasts in 1951 was 22,411 compared with 20,192 in 1950. The first progress report of the Education Foundation for Visual Aids, set up in 1948, was published in October.

In November, the minister of education stated in parliament that, between Oct. 1945 and Oct. 1951 649 new schools had been completed and 610,215 new school places brought into use; and that 18,616 new full-time students entered

universities and university colleges in England and Wales in Oct. 1951.

The approach of the general election in October, coupled with the rapidly rising costs of educational building and equipment, revived once more the controversy over the provision of state funds for denominational, and particularly Roman Catholic, schools. The delicately balanced settlement incorporated in the Education act, 1944, though generally accepted by all other denominations, had not been endorsed by the Roman Catholic hierarchy and at the time of the elections church voices were raised both for and against revision of the Act. The political parties, however, refrained from promises designed to capture the Catholic vote, and the matter never became a serious election issue. Almost the only public criticism of Winston Churchill's new Conservative administration was directed against the omission of his minister of education, Florence Horsbrugh, from the cabinet—the first time such an omission had occurred for at least a quarter of a century.

Scotland. Some 800 pupils from 20 Glasgow schools took part in summer visits to Belgium, France, Scandinavia and Switzerland, up to half their expenses being paid by the Education committee.

Northern Ireland. New salary scales for teachers, effective from April 1, were approved by the ministers of education and finance. For assistants in primary and secondary schools five scales were arranged, for two-year, three-year, and four-year trained teachers, graduates and honours graduates respectively. Scale I was the salary range £360-£675 (men) or £315-£555 (women), scale V £451-£850 (men) or £385-£680 (women). Like the English scales, these provided allowances for posts of special responsibility. These ranged from £40 to £150. The scales meant broadly an increase of 20% on teachers' salaries.

Australia. Scotch college, Melbourne, one of the largest boys' schools in the British Commonwealth, celebrated its centenary on Oct. 6.

New Zealand. The annual meeting of the New Zealand Educational institute in the summer requested the minister of education to set up a consultative committee "to recommend an equitable system of appointments." The existing grading system, adopted in 1920 to get rid of "wire-pulling" and injustices, had been repeatedly condemned by visiting educationists, but teachers were unwilling to abandon it until they were sure that better methods of promotion could be devised.

South Africa. The appeal court at Bloemfontein reversed the decision (of 1950) of the Supreme court in Pretoria which established the right of Transvaal parents to choose the language of primary instruction for their children in private schools. The chief justice stated that in his opinion the Transvaal Education Amendment ordinance, 1949, did not contravene the South African act, and that the state had the right not only to compel parents to educate their children but also to prescribe how they should be educated. The decision provoked the criticism that it empowered the state to order attendance at Afrikaans-medium schools, all of which inculcated "Christian-National" doctrines likened by those outside the three Afrikaans churches to Hitler's National Socialist teaching.

On Aug. 28, the minister of education opened three state schools for physically handicapped children near Kimberley. They were the first of their kind in South Africa. A contracted Braille system in Zulu for blind native children was almost completed by the end of the year.

Malaya. The report, published in August, of the committee appointed by the high commissioner to enquire into the future development of education in Malaya recommended the abolition of separate vernacular schools for the country's different racial communities and the substitution of a single

type of primary school purposely used to build up a common Malayan nationality. This would be known as the "national school" and would provide a free six-year course for pupils aged 6-12 aiming at effective literacy in Malay and English by the end of the course. The report also urged the creation of local education authorities to link school and community.

Albania. It was reported in March that all curricula and textbooks in the schools were completely based on Soviet methods and experience.

Bulgaria. In January the State Planning commission's report on 1950 said that 69.3% more young people had finished high school education than in 1949, and that the number of students attending specialist and trade schools was 24 times greater. The number finishing their examinations in these schools was 16,700, or 14% greater than in 1949; in technical and factory schools it was 47% greater. The number of elementary schools had increased from 7,700 in 1944 to 8,400 in 1950, and of secondary schools from 134 to 218. Kindergartens had increased from 1,092 to 4,500. Special attention was given to minority schools: the number for the Turkish minority had risen from 420 to 1,200.

In March it was announced that owing to the shortage of paper the publication of school books would be considerably decreased.

Czechoslovakia. In February, as part of the new school order, each pupil was issued with a book setting out 16 rules of behaviour. The book was to contain pupils' pledges, accounts of his work at school and home, quarterly reports by teachers, praise and punishments, and correspondence between teachers and parents.

Finland. In February comment was made on the acute shortage of competent secondary school teachers. This was attributed to shortage of buildings, increase in the number of pupils and unsatisfactory salaries, and the opinion was expressed that the shortage would grow worse. In the same month, the elementary school teachers' association threatened to strike, along with civil servants and municipal workers, unless the question of their salaries received a just solution. A motion proposing that the publication of school text books and educational equipment should be taken over by the state was tabled in the Diet and approved by the Cultural Affairs committee.

France. The long-standing controversy over state support for confessional schools played a large part in the cabinet crisis which lasted the greater part of the summer. After many weeks during which a succession of ministers tried unsuccessfully to form a government, René Pleven received a vote of confidence after outlining a compromise plan. This provided for an increase in state scholarships to secondary schools from £1,760,000 to £2,610,000 and made them tenable at state or church schools according to parental choice. A second proposal was for a subsidy of Fr. 300 a month to parents of children at school, the subsidy being paid not to the parent but to an equipment fund in the case of children attending a state school or to the school itself in the case of children at a confessional school. Both proposals eventually passed into law but only after prolonged and bitter debate. In protest, a token strike was called of nursery and primary school teachers on Nov. 9. Earlier, secondary teachers had conducted a five weeks' strike for higher salaries to the consternation of 25,000 baccalauréat candidates whose scripts remained unmarked. The strike ended on Oct. 25 when the minister confirmed that efforts would be made in 1952 to revise their salaries.

A law promulgated in January required the Board of Education to investigate ways of promoting the study of dialects and languages in the regions where they were still used. It permitted teachers to use these dialects and languages in instructing children and, if required, to give one hour a week

to teaching their grammar and literature, attendance at the lessons being voluntary. The law was restricted to Basque, Breton, Catalan, and Provençal regions.

Hungary. In January the cabinet established a Council for Higher Education, to co-ordinate the activities of institutes of higher education. Also in January the Budapest city council opened 70 study halls in secondary schools for 3,560 children without facilities for study at home.

Vicky's cartoon "Babes in the Wood" which appeared in the "News Chronicle" (London), Dec. 12, 1951, after Florence Horsbrugh, Britain's minister of education, had asked for a 5% cut in education estimates.

The minister of education, Jozsef Darvas, in January attributed the unsatisfactory state of education to lack of central direction by the head master of each school, of political and professional knowledge in the teachers, an incorrect balance between educational and political work among students, shortcomings in the Union of Working Youth (DISZ), the teachers' trade union and the Ministry of Education, and a wrong conception of learning among parents. Among the measures he prescribed were the reporting of unsatisfactory conditions to the competent authorities by the teachers' union and the establishment of the head master as the sole representative of the administration of education. Among his duties were "the consolidation of state discipline among the teachers and of their political and professional training." Among measures to improve the MHK (Ready to Work and Fight movement) system of physical training introduced (from the U.S.S.R.) in 1949, the youth sports section of the movement's committee, in conjunction with the Ministry of Education, was in February ordered to elaborate within one month a new physical training curriculum, based on MHK, for general, secondary and high schools.

Republic of Ireland. In July the Minister of Education accepted new salary scales recommended by the Conciliation council. An important feature of these was provision for children's allowances.

Israel. It was stated in August that £1 3 million would be spent on building new schools in 1951-52. Immigration and the introduction of compulsory education had made existing premises totally inadequate. The Compulsory Education act led to 25,750 children registering in Israel's Arab schools, three times as many as in 1948. About 15,000 were said to be still evading school.

Italy. A new "children's city" for orphans came into being on the outskirts of Modena as the result of collections among British ex-prisoners of war who had been helped by the local population to elude the Germans after escaping from their camps in 1943. The city honours particularly Don

Elio Monari who was deported to Germany and shot for sheltering ex-prisoners.

Netherlands. In July the minister of education proposed to parliament drastic reforms in the educational system, including an additional year of compulsory education, making eight years in all. A ministerial report published in September stated that, of 6,894 primary schools, 1,043 were using modern methods. Among them were 45 Montessori schools, 18 Dalton Plan schools, 451 with a special task system and 324 in which education was grouped around centres of interest.

In January the *Werkplaats*, the well-known progressive school at Bilthoven, founded and run by Kees Boeke, celebrated its silver jubilee. Among the pupils were Queen Juliana's four daughters.

Poland. In February it was reported that an international academy of Islamic culture had been set up, to unite the Moslem scholars of the world, spread education, establish research centres, open libraries and set up an international Moslem university in Europe. The Economic Plan and Budget committee reported in March that expenditure on education and culture in 1951-52 was to be 5.7% greater than in the previous year, totalling nearly 14% of budget expenditure. Expenditure on higher education was to be 17% higher. In March the claim was made that "the principle of universal education was realized for the first time in Polish history in the school year 1950-51."

Rumania. For the first time correspondence courses were started to enable working people to improve their qualifications. Among the students were people being trained as teachers of physics and mathematics for elementary and middle schools. The first middle school of popular art was opened in Bucharest. Its curriculum included a course in Marxist-Leninist aesthetics. The first school in the country for mining surveyors was opened at Baia Mare.

Spain. In his New Year message General Franco (*q.v.*) claimed that 4,000 new schools had been set up in 1950.

Sweden. New salary scales for teachers were introduced in Jan. 1951. For the ordinary teacher the range was £700-£950, for the better teachers £950-£1,200. Teachers in the far north received additional allowances. The scales covered nine years, with increments every third year.

Turkey. In January the minister of education announced the adoption of severe measures to cope with extremist tendencies in teachers.

U.S.S.R. In January Sergey Kaftanov, minister of higher education, stated that at the end of 1950 there were 37 million pupils in 220,000 primary, seven-year, secondary schools and the technical schools and other specialized secondary establishments—4 million more than the target set by the Five-Year plan. There were 1,600,000 teachers—80,000 more than in 1949. According to the figures published in March, 26% of the budget expenditure for 1951-52 was allocated to social and cultural affairs.

Yugoslavia. In January it was stated that 2,400,000 Yugoslavs, 15% of the total population, were attending elementary, secondary, and higher schools. The number of secondary school pupils (440,000) was treble that before the war, and since the introduction of compulsory eight-year schooling the number of children between 7 and 13 attending school had increased considerably.

International. In January U.N.E.S.C.O. announced the first steps taken under the United Nations scheme for technical assistance to under-developed countries. It stated that an authority from Tunisia had arrived in the Lebanon to assist with the organization of research centres for education, and an Indian educationalist had gone to Indonesia to draw up a plan for combating illiteracy. The sixth general conference of U.N.E.S.C.O., held in Paris in June-July, resolved to set up six regional centres to train teachers for

fundamental education in countries with largely illiterate populations. The scheme would take 12 years to complete, at an estimated cost of \$20 million. The first centre was opened in May at Patzcuaro, Mexico. At the instance of the United Kingdom delegation U.N.E.S.C.O.'s constitution was amended to admit non-self-governing territories to associate membership. In August, the director general of U.N.E.S.C.O. appealed to governments to co-operate in remedying the shortage of newsprint, stating that it would be impossible to supply books and papers to people learning to read if their number increased by as little as 5%. A U.N.E.S.C.O. seminar on the teaching of history was held at Sèvres, near Paris, and in November 125 teachers from seven countries of southeast Asia attended a six-day seminar in Delhi, organized by U.N.E.S.C.O. and the World Federation of United Nations associations, to study ways of teaching children and adults the ideals behind the United Nations.

Towards the end of the year U.N.E.S.C.O. inaugurated a gift coupon scheme to enable groups of people in Great Britain, France and the United States to present books, films, musical instruments and other educational equipment to needy schools in various parts of the world. A regional conference, similar to that held in Havana in 1950, was held in Bangkok in November and December. Representatives of Afghanistan, Australia, Burma, Ceylon, India, Indonesia, New Zealand, Pakistan, the Philippines and Thailand attended to consider means of strengthening their national commissions and of securing the greatest benefit for their region from the general programme of U.N.E.S.C.O.

In April it was announced that, under the technical co-operation scheme of the Colombo plan, the Australian government had offered 50 scholarships and the Canadian government 25 scholarships and fellowships to the government of India for postgraduate study. A treaty for joint consultation on educational and agricultural matters between the U.S.A. and Chile was signed in January. In September France and Turkey signed an agreement to extend cultural relations.

The Seventh World jamboree took place at Bad Ischl, Austria, in August and was attended by 13,000 boy scouts

(*q.v.*). In Berlin, the Communist-sponsored World Festival of Youth made much of processions of young people chanting slogans and bearing portraits of Communist leaders and caricatures of western statesmen. In July the Commission on Educational Organizations of World Brotherhood met in Copenhagen. It considered the implications of anthropology and social psychology upon inter-group behaviour. (H. C. D.; L. WN.)

United States. The Office of Education estimated in Sept. 1951 that enrolment in public and private schools was: elementary schools, 24,468,000; high schools, 6,168,000; colleges, 2,225,000; total, 33,121,000, an increase of about 420,000 over 1950. In November an attendance was reported for colleges and universities of 2,116,000 in 1,806 institutions, a drop of 10·8% in male students and of 1·3% in female students below 1950. The number of veteran students declined by 32·1%.

Federal Participation in Education. As he had done in earlier years, President Harry S. Truman reminded congress in January of the need for immediate legislation to provide federal aid to public education but very little action was taken by congress during the year.

Early in November President Truman vetoed a bill authorizing the government to construct and operate schools in communities where federal defence activities caused an excessive burden on school facilities because of a clause which would perpetuate race segregation.

In June congress passed public law 51 to allow high school and college students who were doing well scholastically to be deferred from military service. Aptitude testing up to October of 175,000 students in mathematics, vocabulary and reading comprehension resulted in 37% failing to qualify for exemption.

Higher Education. The knotty question of how to finance colleges and universities again came to the fore in 1951. Inflation and the decline in funds from tuition pointed to curtailment of curricula and reduction of teaching personnel. That no grave crisis ensued was attributed to increased appropriations by municipal and state legislatures, contributions by alumni and other citizens and grants by the Ford foundation and the Twentieth Century fund.

The class-room block of the new buildings of the Wesley girls' secondary school designed by Maxwell Fry at Cape Coast, Gold Coast. The school was completed in 1951.

Considerable public attention was focused upon the revelations regarding the status of intercollegiate athletics. The authorities at the United States Military academy dismissed 90 cadets for cheating in examinations. These students, according to the superintendent of the academy, composed an organized ring of football players and their friends. Another national scandal, in basketball, affected seven colleges in the east and midwest. Basketball players of national repute were arrested for allegedly having accepted money to "fix" results. A wave of criticism emanated from college and lay sources and some institutions announced reforms in the administration of athletics such as the removal of subsidies to athletes and greater stress on intramural than on extramural sports.

Teacher Supply. The annual survey of teacher supply conducted for the National Education association, reported that only 32,000 new elementary school teachers were available for a minimum 80,000 vacancies.

Race and Religion. Early in January the U.S. Supreme court ruled that Louisiana State university, Baton Rouge, must admit Roy S. Wilson, a qualified Negro student, to its law school. In October the same court ordered the university to permit Negro students to study in the school of nursing.

The fact that the federal district court of Tennessee handed down a decision in April compelling the University of Tennessee, Knoxville, to admit Negroes to its professional schools did not remove the barrier of segregation; it was necessary for four Negro students to submit an appeal in December to the U.S. Supreme court regarding their application for admission to the university. The University of North Carolina, Chapel Hill, announced in April that it would accept its first Negro medical student and in November, after some debate, it allowed Negroes to sit beside white students at football games.

The Office of Education announced the presence of 74,526 students in Negro colleges during 1950, whereas in 1900 there were only 2,624 enrolled.

Communism and Academic Freedom. The dispute which strained relations between the faculty and the board of regents of the University of California over a period of two years was settled by two actions. In October the board voted to discontinue the anti-Communist oath requirement, and in November it defeated an attempt to reconsider the first vote.

The case of the eight teachers in New York city who had been suspended in March 1950 for having refused to say whether they were Communists or not also reached a conclusion. Early in February the board of education unanimously upheld the findings of the special trial examiner, who had recommended at the end of the previous year that these teachers be dismissed.

A survey released in May by the *New York Times* showed that the faculty and students of 72 representative colleges felt that free inquiry was being stifled by the fear of being branded "red" or "pink."

Relations with Other Nations. The Institute of International Education reported in April that there were more than 30,000 students from other countries attending 1,400 U.S. colleges and universities during 1950-51, as compared with the 26,433 in attendance at 1,210 institutions during the previous academic year. An important factor in the rise in such enrolment was the influx for the first time of students from many areas of Asia and Africa. (See also ADULT EDUCATION; CAMBRIDGE UNIVERSITY; LIBRARIES; LONDON UNIVERSITY; OXFORD UNIVERSITY; TEACHERS, TRAINING OF; UNIVERSITIES AND COLLEGES; VOCATIONAL EDUCATION.) (W. W. BN.)

EGYPT. Independent kingdom of northeast Africa, bounded N. by the Mediterranean, S. by the Anglo-Egyptian Sudan, E. by Israel and the Red sea, W. by Cyrenaica and the Sahara. Area: 386,110 sq.mi. Pop.: (1947 census) 19,087,849; (mid-1950 est.) 20,439,000. Language: mainly Arabic (97%), with minorities speaking Greek, Italian, Armenian, etc. Religion: Moslem (mainly Sunni) 91.4%; Christian (mainly Copts) 8.19%; Jewish 0.4%. Chief towns (pop., 1947 census): Cairo (cap., 2,100,506); Alexandria (925,081); Port Said (178,432); Tanta (139,965); Mahalla el-Kubra (115,509); Suez (108,250); Mansura (102,709). Ruler, King Farouk I; prime minister, Mustafa el-Nahas Pasha.

History. The year 1951 was dominated by a catastrophic deterioration in relations with the United Kingdom. The Wafd had negotiated, amid almost complete satisfaction, the agreement of which the Anglo-Egyptian treaty of 1936 was the fruit, and it was this party, under the leadership of Nahas Pasha, which had stood firmly by the Allies during the military crisis of 1942. These circumstances had given rise to the expectation that the return to power of the Wafd in the preceding year would be followed by another satisfactory adjustment of Anglo-Egyptian relations. Early expectations that this might be so were already diminished by the events of the first year of Nahas Pasha's new period of office. The accumulation of internal difficulties, together with the revival of the familiar charges of corruption and political unscrupulousness, once more coincided with an increasingly anti-British tone in official pronouncements.

In Jan. 1951 Egyptian and British naval units took part in joint manoeuvres, and in March land forces of the two countries engaged in joint exercises in the Sinai peninsula. On March 15 a long-term settlement covering the use of Egypt's sterling balances was announced but, when it became apparent that political negotiations were in prospect, the familiar spectacle of anti-British demonstrations made it clear that they would be beset with difficulties. On the British side, the House of Commons, where there was a considerable irritation with Egypt, arising from the latter's policy of restricting the free use of the Suez canal in consequence of the continued official state of war with Israel, expressed anxiety at reports of the British government's intention to withdraw from the Suez canal, and on April 11 the foreign secretary, Herbert Morrison, promised that the house would have an opportunity to veto any agreement that might be arrived at in this connection. On May 1, the Egyptian foreign minister, Mohammed Salah ed-Din, declared that British proposals were inadequate and that Egypt stood by its demand for complete evacuation and the unity of the Nile valley. Egyptian proposals involving the immediate evacuation of the Suez canal were rejected by the United Kingdom on June 9, and feeling was exacerbated when an Egyptian corvette stopped and searched the British supply ship "Empire Roach" in the Gulf of Aqaba. On July 14 British forces in these waters were reinforced, and on July 22 Egypt officially rejected an invitation to attend a conference on African defence. On August 6 Salah ed-Din publicly accused the British government of "closing the door" on further useful discussions and Aug. 26, the 15th anniversary of the signature of the Anglo-Egyptian treaty of 1936, was marked by demonstrations in Cairo which degenerated into rioting. This was notable for attacks on not only the British, but the U.S. embassy.

In August there was a good deal of talk in Egyptian circles of the abrogation of the 1936 treaty and extreme opinion took comfort from the evident embarrassment of the British government in its relations with Persia. The British government attempted to keep negotiations alive, but an important new factor made itself felt when it became known that a proposal to set up a joint middle eastern command had

On May 6, 1951, King Farouk was married in Cairo to Narriman Sadek, daughter of the late Hussein Fahmy Sadek Bey. The bride and bridegroom with members of their families (1), and (2) the official engagement photograph of Narriman Sadek. (3) The monograms of Farouk (left) and Narriman (right) (4) Mohammed Fuad Serag ed-Din Pasha, minister of the interior, announcing in parliament on Oct. 15, 1951, the Egyptian government's decisions to abrogate the 1936 treaty and the 1899 Sudan agreement.

been agreed to in Washington, and that Egypt would shortly be approached to join such a body which would be linked to the North Atlantic treaty organization. On Oct. 8, a matter of days—perhaps even of hours—before the official approach to the Egyptian government in this connection, Nahas Pasha acted unilaterally by tabling decrees in the Chamber of Deputies to approve the abrogation of the 1936 treaty which provided the legal basis for the presence of British troops in the canal zone. At the same time he asked the Egyptian parliament to agree to the abolition of the Anglo-Egyptian condominium over the Sudan, with the proclamation of King Farouk as “King of Egypt and the Sudan.” The next day the British government, through the foreign secretary, issued a statement taking the strongest exception to Egypt’s action and announcing its intention to adhere to the treaty right by which troops were maintained in Egypt. Morrison declared that the treaty contained no provisions for such a unilateral abrogation of it.

It was possible to hold the view that, had the proposals for a joint command been made some months earlier, there might have been a good prospect of their immediate acceptance, but feeling in Egypt had been steadily mounting and its strength was at once apparent in the renewed popularity of the Wafdist government, a result which may very well have entered into its calculations. It should further be noticed that British opinion during the year was much less detached than during past periods of Anglo-Egyptian friction, nor were the hostile and often unrestrained comments of some sections of the English press upon the conduct and

personality of King Farouk without their influence in the creation of ill-will. Another unfamiliar feature in this situation was the outright declarations of support for the United Kingdom which came from both the United States and France.

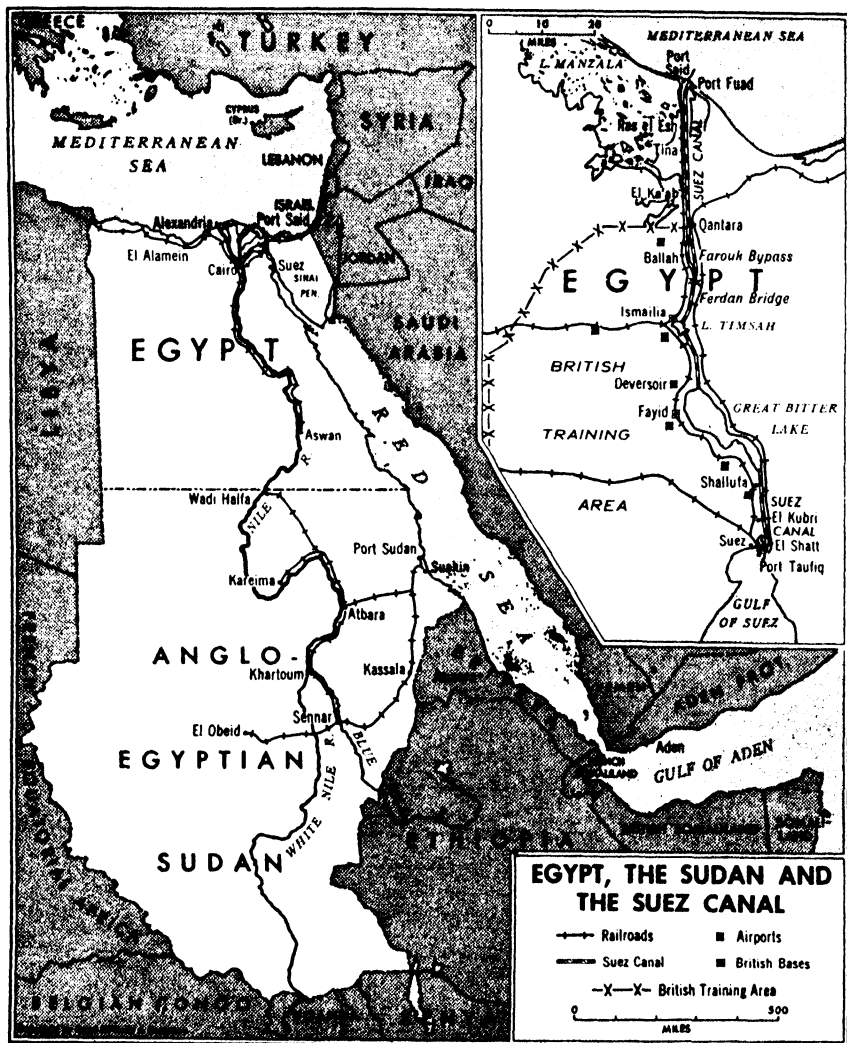

On Oct. 13 the proposals for joint defence which had been anticipated by Nahas Pasha’s action were presented to the Egyptian government by the ambassadors of France, Great Britain, the United States and Turkey. These provided for the creation of a new middle east command in which Egypt would be an equal partner, and the British government indicated that it would agree, if these proposals were accepted, to the supersession of the treaty of 1936 and the immediate surrender of the Suez canal zone to the Egyptian government, on the understanding that it would become an Allied base with full Egyptian participation.

On Oct. 17 a state of emergency was declared, and the British forces in the canal zone, heavily reinforced, began to prepare themselves as for a siege. The canal was kept in full operation, although the decline in the number of Egyptian workers and organized passive resistance caused some embarrassment. On the Egyptian side, the Arab league did not make the immediate rejection of the western military proposals which had been looked for.

Charges and counter-charges were frequent during November, each side standing its ground, and there were some outbreaks of violence involving loss of life, but for the most part the situation remained comparatively calm, a notable feature being the continued close liaison of British and Egyptian armed forces. Bad feeling between the British and the Egyptian police in the affected areas was a major cause of such violence as occurred.

The year was by no means uneventful apart from this dominant theme. On May 6 King Farouk was married, for the second time, to Narriman Sadek, the daughter of a government official. Substantial measures for rearmament were planned and a £6 million social security programme was inaugurated at the end of January. Significant social changes seemed to be indicated when it was announced on Feb. 3 that large areas of reclaimed lands would be distributed in an attempt to create a class of small landowners, and on the following day that the tax on farm land would be doubled. An agitation for equal political rights for women gained considerable support, and in February the police felt obliged to close the doors of parliament to over 1,000 women demonstrators. A royal decree on May 12, appointing replacement for 36 term-expired senators, gave the Wafd a clear majority in that house. (See also ANGLO-EGYPTIAN SUDAN; SUEZ CANAL.) (H. S. D.)

Education. Government schools (1948-49): kindergarten 57; primary 327, pupils 100,000; elementary 5,000, pupils 1,000,000; technical 70, pupils 17,136; commercial 17, pupils 5,481; agricultural 13, pupils 2,725; domestic science 15, pupils 1,763. Non-government schools: primary 452; secondary 76. Teachers’ training colleges 53, pupils 8,382. Universities 3, students 20,259. Other institutions of higher education 8.

A cartoon by Vicky in the "News Chronicle" (London), May 3, 1951.

Agriculture. Main crops ('000 metric tons, 1949; 1950 in brackets): cotton, ginned, 391 (377); maize 1,250 (1,287); wheat 1,167 (1,018); barley 138 (91); millet and sorghum 567; rice, paddy, 1,168 (1,241); sugar, raw value 170 (180); onions 184 (217); potatoes 204 (160); broad beans 321; lentils 47. Livestock ('000 head, March, 1947): cattle 1,321; sheep 1,875; goats 1,474; asses 1,125; horses 28; mules 12; camels 197; buffaloes 1,240; pigs 50; chickens 16,312. Fisheries (1948): total catch 48,350 metric tons.

Industry. Crude oil production ('000 metric tons, 1950; 1951, six months, in brackets) 2,343 (1,170). Raw materials ('000 metric tons, 1948; 1949 in brackets): phosphate rock 377 (350); manganese ore 59 (138); salt 126 (350). Manufactured goods: cotton yarn ('000 metric tons, 1949; 1950, nine months, in brackets) 38.72 (23.28); cotton piece-goods (million sq.m., 1948; 1949 in brackets) 156 (151); cement ('000 metric tons, 1948) 768.

Foreign Trade. (£E million, 1950; 1951, six months, in brackets): imports 196.5 (118.2); exports 175.4 (123.7). Main sources of imports (1950): U.K. 19.4%; France 9.8%; Italy 7.3%; U.S. 5.9%. Main destinations of exports: U.K. 21.7%; India 12.5%; U.S. 8.8%; Italy 8.5%. Main imports: machinery 9.5%; wheat and flour 8.1%; fertilizers 5.9%. Main exports: cotton (raw) 85.4%; rice 4.4%; cotton yarn 1.4%; onions 1.2%.

Transport and Communications. Roads (1947): 8,874 mi. Licensed motor vehicles (Dec. 1950): cars 59,000, commercial 17,000. Egyptian State railways (1949): 5,318 mi. Shipping (merchant vessels of 100 gross tons and over, July 1949): 57; total tonnage 105,462. Telephones (1948): subscribers 98,093. Radio receiving sets (1949): 183,000.

Finance and Banking. Budget (£E million): (1950-51 est.) revenue 178.0, expenditure 206.0; (1951-52 est.) revenue 212.4, expenditure 231.0. National debt (April 1947; April 1948 in brackets): 118.8 (125.0). Currency circulation (Sept. 1950; Sept. 1951 in brackets): 161.2 (177.1). Gold and foreign exchange (million U.S. dollars, April 1950; April 1951 in brackets): 943 (777). Bank deposits (May 1950; May 1951 in brackets): 172.0 (167.3). Monetary unit: Egyptian pound with an exchange rate of £E 0.975 to the pound and £E 0.349 to the U.S. dollar.

EIRE: see IRELAND, REPUBLIC OF.

EISENHOWER, DWIGHT DAVID, United States army officer (b. Denison, Texas, Oct. 14, 1890). He graduated from the U.S. Military academy at West Point in 1915 and during World War I served as an instructor, camp commander and commander of tank troops. He graduated later from the Army War college and the Army Industrial college, served in the office of the chief of staff in Washington, and in 1935 saw duty in the Philippines as chief of staff to General Douglas MacArthur. During World War II he was supreme commander of the Allied armies that conquered North Africa and Sicily (1943), invaded Italy (1943), landed

in France (1944) and completed the conquest of Germany from the west in 1945. He was made commander of U.S. occupation forces in Germany in 1945 and chief of staff Nov. 20, 1945, retiring from that post, Feb. 7, 1948, to become president of Columbia university. On Dec. 19, 1950, he took leave from Columbia to become supreme Allied commander of the integrated Atlantic treaty forces set up for the defence of western Europe.

He spent much of 1951 organizing both U.S. and European participation in the pact armies, and on April 2 formally assumed command of S.H.A.P.E.—supreme headquarters, Allied powers in Europe—with headquarters near Paris. After touring western Europe early in 1951 he appeared before U.S. congressional committees to report on western European defence measures. He told the committee he would "instantly" use the atomic bomb in any new war if the net advantage were on his side.

Eisenhower was prominently mentioned as a possible presidential candidate for 1952. Elements of both political parties at one time or another sought to claim him, and in various polls it was indicated that he would be a strong contender if nominated.

ELECTIONS. During 1951 general elections were held in Great Britain, Australia, New Zealand and Ireland; in Finland, France, Greece, Luxembourg, Switzerland and Israel. On Oct. 25 the biggest democratic experiment in history began in India when polling started in Himachal Pradesh: returns from all the states of the Union were expected to be completed by the second half of Feb. 1952.

Great Britain. In the general election of Oct. 25, out of the electorate of 34,553,197, 82.6% recorded their votes as against 84% on Feb. 23, 1950. Results, compared with those of 1950, were as follows:

Parties	1951			1950		
	Votes	%	Seats	Votes	%	Seats
Conservative*	13,724,418	48.04	323	12,501,983	43.5	298
Liberal	730,551	2.53	6	2,621,489	9.1	9
Labour	13,948,385	48.73	295	13,295,736	46.4	315
Communist	21,640	0.08	0	91,815	0.3	0
Other	177,329	0.62	1	258,454	0.7	3
Totals	28,602,323		625	28,769,477		625

* Including National Liberals and Liberals and Conservatives.

The Conservative party increased its total vote by 1,222,435 and the Labour party by 652,649. Only 109 candidates were put forward by the Liberal party as against 475 in 1950. The Labour party lost 22 seats, one to a Conservative-Liberal alliance at Bolton West and 21 to Conservatives elsewhere, and in Anglesey and Merioneth gained two seats from the Liberals. Of the 22 constituencies lost by Labour, all but one—Doncaster—had Liberal candidates in 1950; on Oct. 25 only four of the remaining 21 were contested by Liberals. In three of the four—Blackley, Dulwich and Conway—the Liberal vote exceeded the Conservative majorities. In the other 17 constituencies the Liberal vote appeared to have favoured the Conservatives against Labour in the ratio of about 5 to 2. Eight of the 22 seats lost by Labour were won on majorities of less than 500 and 21 on majorities below 2,500.

Of 1,376 candidates 95 forfeited their deposits of £150 by failing to receive one-eighth of the total poll in the respective constituencies: 66 Liberals and all 10 Communist candidates lost their deposits.

Commonwealth. *Australia.* On Dec. 10, 1949, the Conservative-Liberal coalition had been voted into office with a majority of 27 in the House of Representatives. But, owing to the method of election for the Senate, Labour had in the upper house a majority of eight which was used to

The number of seats in the House of Commons obtained by the Conservative, Labour and Liberal parties in the general elections, 1900-1951.

obstruct legislation and the Menzies-Fadden government was eventually compelled to seek a double dissolution. On April 28, 1951, nearly five million Australians voted in a federal election to renew the entire membership of the Commonwealth parliament, that is, 60 senators and 123 members of the House of Representatives, including two members for the Northern and Australian Capital territories.

With the exception of Tasmania, where proportional representation with single transferable vote is used, the Australian states elect their representatives by majority system with alternative vote. The results of the voting for the House of Representatives, as compared with three previous elections, were as follows:

Parties	1943	1946	1949	1951
United Country (Conservative)	9	11	20	17
United Australia (Liberal)	14	17	54	52
Federal Labour	49	43	48	54
Other	3	4	1	0
Totals	75	75	123	123

Senators are elected for six years and members of the lower house for three. Each of the six states voting as a single electorate returns 10 senators under a system of proportional representation with single transferable vote. The new Senate was composed as follows (previous party strength in brackets): United Country and United Australia parties 32 (26), Labour party 28 (34). The Conservative-Liberal coalition saw its majority in the House of Representatives reduced from 27 to 15, but in the Senate it gained a majority of four seats.

At the election to the House of Representatives the Communists, all of whose 22 candidates forfeited their deposits, received 91,411 votes including 81,560 cast in New South Wales.

New Zealand. Seeking a vote of confidence in its handling of a waterfront strike, the National government went to the country when only halfway through its normal term of office, and in so doing increased its majority from 12 to 20. The results of the election on Sept. 1 (by majority system), as compared with the four previous elections, were as follows:

Parties	1938	1943	1946	1949	1951
National (Conservative)	24	34	38	46	50
Labour	54	45	42	34	30
Independents	2	1	0	0	0

There were 1,167,073 European and 38,530 Maori electors, and 80.6% of the total went to the polls. The 30 seats gained by Labour included the four seats allotted to Maoris. The votes polled by the parties were as follows (in brackets, votes polled on Nov. 30, 1949): National 518,721 (515,649), Labour 446,545 (469,766), Communist 476 (3,267), Independents 1,412 (6,450). All six Communist candidates forfeited their deposits.

Ireland. The Republic of Ireland was the only country in Europe to adopt a system of proportional representation with a single transferable vote. At the election of May 30 this system, reproducing the moods of the electorate with almost mathematical exactitude, failed to give a majority to any party. The election was in fact a trial of force between the Fianna Fáil of Eamon De Valera and the Fine Gael of John A. Costello, that is, between two parties broadly Conservative. The results, as compared with those of the election of Feb. 4, 1948, were as follows:

Parties	Seats		First Preference Votes	
	1951	1948	1951	1948
Fianna Fáil (Sons of Destiny)	69	68	616,722	553,917
Fine Gael (Irish Clan)	40	31	343,823	262,202
Clann na Talmhan (Farmers)	6	7	38,872	71,686
Clann na Poblachta (Republicans)	2	10	54,260	173,166
Labour	16	19	151,831	149,089
Independents	14	12	127,529	112,816
Totals	147	147	1,333,037	1,322,876

The government coalition (Fine Gael, Farmers, Republicans and Labour), which combined 67 seats in the previous Dáil, was reduced to 64, but within the coalition the Fine Gael increased its strength by nine seats, mainly at the expense of its allies the Republicans. The Independents continued to hold the balance of power. The only Communist, Michael O'Riordan, chairman of the Irish Workers' league, obtained only 300 votes in southeast Dublin.

Europe. Finland. In the general election on July 2-3, the Finnish people demonstrated for the third time since World War II that their country would not be conquered by the Communists from within. The Social Democrats, main opponents of the Communists, displaced the Agrarians as the largest party in the Eduskunta or Diet (200 members); the Communists and their "fellow travellers" of the Finnish Democratic People's league (S.K.D.L.) regained five seats out of 13 they had lost on July 1-2, 1948. The position of the various parties was as follows (results of the previous election in brackets):

Parties	Votes	%	Seats
Conservative	265,188	14.5 (17.1)	28 (33)
Swedish	137,151	7.5 (7.7)	15 (14)
Agrarian	425,747	23.4 (24.2)	51 (56)
People's (Liberal)	102,894	5.6 (3.9)	10 (5)
Social Democratic	479,998	26.4 (26.3)	53 (54)
S.K.D.L. (Communist)	390,647	21.4 (20.0)	43 (38)

Out of some 2,560,000 electors on the register, 73% recorded their votes, as compared with nearly 80% in 1948.

France. On June 17, France went to the polls for the fourth time since the end of World War II but under a revised electoral system.

Except in Greater Paris (the départements of Seine and Seine-et-Oise), the elector voted for a list comprising a number of candidates equal to the number of seats to be filled in the constituency. There was only one ballot and the vote was a majority one in the sense that a list, or a group of allied lists, which obtained an absolute majority of the votes cast, was allotted all the seats. If no list or group of allied lists secured a clear majority, the seats were allotted on a proportional basis. In the Greater Paris area proportional representation remained in force. The need to reduce the parliamentary representation of both Communists and

Gaullists was responsible alike for this exception and for the return to the majority vote in the rest of France.

Replacing the 621 deputies of the outgoing National Assembly, the number to be elected was 627, the increase being exclusively in the number of oversea deputies. The election results for metropolitan France, which returned 544 deputies in 103 constituencies, compared with those for 1946, were as follows:

Parties	June 17, 1951		Nov. 10, 1946	
	Votes	%	Votes	%
Rassemblement du Peuple Français (R.P.F.)	4,134,885	21.7	313,636*	1.6
Conservatives†	2,496,570	13.1	2,465,526	12.8
Mouvement Républicain Populaire (M.R.P.)	2,353,544	12.3	5,058,307	26.4
Rassemblement des Gauches Républicaines‡	2,194,213	11.5	2,381,384	12.4
Socialists	2,764,210	14.5	3,431,954	17.9
Communists	5,038,587	26.5	5,489,288	28.6

* The R.P.F. was formed in April 1947, but at the 1946 election there were lists of the Union Gaulliste in certain constituencies.
 † Includes the former Parti Républicain de la Liberté (P.R.L.), the Independent Republicans and the Parti Paysan d'Union Sociale.
 ‡ Includes the Parti Républicain Radical et Radical-Socialiste and the Union Démocratique et Socialiste de la Résistance (U.D.S.R.).

Out of 24,973,148 electors 78.2% voted, almost exactly the percentage of 1946 (78.1%). From the voting figures for metropolitan France emerge the fact that out of 18,982,009 valid votes cast, 9,173,472 were recorded by the two anti-parliamentarian but mutually hostile movements.

Party labels at the general election and those of *groupes* in the National Assembly do not always correspond. In order to collect more votes many parties conclude electoral alliances, but divide after the election and form their own groups in the assembly. The distribution of seats in the newly elected National Assembly, as compared with that in the old, was as follows:

Groups	New Assembly		Old Assembly	
	July 1951	Dec. 1946	May 1951	May 1951
R.P.F.	121	10	25	25
P.R.L.	51	38	27	27
Independent Republicans		28	25	25
Peasant and Social Action	42	8	30	30
M.R.P.	94	164	155	155
U.D.S.R.	16	26	13	13
Radicals	72	43	46	46
Socialists	107	101	99	99
Communists*	106	190	183	183
Others	18	11	18	18
Totals	627	619	621	621

* In the Communist totals are included the deputies of the Communist-controlled groups, the Union des Républicains Progressistes, who were 13 in Dec. 1946, 8 in May 1951 and 4 in July 1951, and the Rassemblement Démocratique Africain, who were 6 in the old assembly and 3 in the new.

Although the Communists lost only 450,701 votes (8.2% of their total vote in 1946), they lost 84 seats (44.2%). The Socialists lost 667,744 votes (19.6%), but, thanks to the electoral law, gained eight seats. Greatest losers were the Christian Democrats, or M.R.P.: their total vote was reduced by 2,704,763 (53.5%), and between 1946 and 1951 they lost 70 seats. Most certainly all their lost votes went to the R.P.F.

Greece. For the third time since the liberation a general election took place on Sept. 9. Formally, voting was still by the proportional representation system, with an exclusively male franchise, but the new electoral law adopted by the Chamber of Deputies on July 27 favoured parties securing over 17% of the total poll, enabling them to increase their seats. In contrast to 1950, when 26 parties sought representation, in 1951 there were 17. As in the past, the contest was more a battle of personalities than one concerned with differences of policy. The results were as follows:

Parties	Votes		Seats	
	1951	1950	1951	1950
Ellinikos Synaghermos (Greek Rally)	623,297	—	114	—
Neo-Metaxists (P.A.P.)	—	137,721	—	16
Nationalists (N. Zervas)	—	61,580	—	7
National Revival Front (M.E.A.)	—	88,798	—	7
Populists (K. Tsaldaris)	113,580	317,583	2	62
Liberals (S. Venizelos)	324,482	290,983	57	56
National Progressives (E.P.E.K.)	399,529	277,812	74	45
Democratic Socialists (G. Papandreou)	37,033	180,085	—	35
Socialists (E.L.D.)	4,208	163,520	—	18
Communists (E.D.A.)	178,325	—	10	—
Others	25,835	177,933	1	4
Totals	1,706,289	1,696,015	258	250

The Greek Rally under Field Marshal Alexandros Papagos became the strongest single party, having secured 36.6% of the votes: it supplanted all other parties relying on right-wing and Conservative opinion. The Populists led by Konstantinos Tsaldaris, who on March 31, 1946, won an absolute majority in a Chamber of 354 members, and who on March 5, 1950, polled 18.8% of votes, fared badly on Sept. 9, polling 6.7% of votes and gaining only two seats. The right-wing Liberals led by Sophocles Venizelos, who with a poll of 17.2% had the second strongest party in the previous chamber, increased their poll to 19.1%, but the E.P.E.K. (Ethniki Proodeftiki Enosis Kentrou or National Progressive Union of the Centre), otherwise the left-wing Liberals, led by General Nikolaos Plastiras, did better still, increasing their poll from 16.4% to 23.5%. Papandreou's

“The Ship of State if Attlee Loses,” a cartoon by Giles in the “Daily Express” (London) on election day, Oct. 25, 1951. On left “As Giles’s George dreams of it” and on right “as Giles’s Vera dreams of it.”

party and the Socialists (E.L.D., Enosis Laikis Dimokratias or Union of Popular Democrats) led by Alexandros Svolos were other victims of the electoral law. Under the name of E.D.A. (Enosis Dimokratikis Aristeras or Union of the Democratic Left), the Communists took part in a general election for the first time since World War II; they polled 10.5% of votes and gained 10 seats.

Luxembourg. On June 3 more than 80,000 electors renewed 26 seats of the Chamber of Deputies, of which the total was increased from 51 to 52. Including the 26 deputies elected for six years on June 6, 1948, the composition of the chamber was as follows (previous strength in brackets): Christian Democrats 21 (22), Liberals 8 (9), Socialists 18 (14), Communists 4 (5), Independent 1 (1).

Switzerland. On Oct. 27-28 the oldest democracy of the world renewed its parliament composed of the National Council (Nationalrat or Conseil National) and of the Council of States (Ständerat or Conseil des Etats). The National Council consisted of 194 members elected for four years, but from 1951 the cantons of Zürich and Aargau were each allotted an additional seat. Out of 44 members of the Council of States (two per state), 23 were submitted for re-election in 1951. The political composition of the new parliament, compared with that elected on Oct. 27, 1947, was as follows:

Parties	National Council		Council of States	
	1951	1947	1951	1947
Liberal Conservatives . . .	5	7	2	2
Catholic Conservatives . . .	48	44	18	18
Agrarians . . .	23	21	4	4
Radical Democrats . . .	51	52	11	10
Independents . . .	10	8	—	1
Liberal Democrats . . .	4	5	2	2
Social Democrats . . .	49	48	7	6
Party of Labour (Communists) .	5	7	—	—
Others . . .	1	2	—	1
Totals . . .	196	194	44	44

Voting is by the proportional representation system, with an exclusively male franchise.

Middle East. Israel. For the second time after its creation as an independent state, Israel held a general election on July 30. Its population having in the meantime almost doubled, the number of valid votes rose from 440,095 on Jan. 25, 1949, to 687,492. The new Knesset (parliament) showed some change which, however, involved no break in the continuity of Israel's young political tradition. The Nationalist Herut or Freedom party of Menahem Beyghin lost 6 of the 14 seats it had held. The United Religious Front of Ashkenazim Jews split into four small parties but lost only one seat in the process. The Conservative General Zionists strengthened their position by gaining 13 new seats. The Israeli Labour party or MAPAI (Miflegat Poalei Eretz Israel) lost one seat and remained the strongest single party in the Knesset. The pro-Cominform United Workers' party or MAPAM (Miflegat Poalei Menuhedet) polled 2% less than in 1949 and lost four seats. The official Communist party increased its vote by 0.6% and added one seat to its previous four. The results, compared with those of Jan. 25, 1949, were as follows:

Parties	1951			1949		
	Votes	%	Seats	Votes	%	Seats
Herut . . .	45,651	6.65	8	49,782	11.3	14
Hapoel Hamizrahi . . .	46,347	6.75	8	52,982	12.0	16*
Aguda Israel . . .	13,799	2.0	3			
Poalei Aguda Israel . . .	11,194	1.6	2			
Mizrahi . . .	10,383	1.5	2			
General Zionists . . .	111,394	16.1	20	22,661	5.2	7
Progressives (Liberals) . . .	22,171	3.2	4	17,786	4.0	5
Sephardi group . . .	12,002	1.8	2	15,287	3.5	4
MAPAI . . .	256,456	37.3	45	155,274	35.3	46
MAPAM . . .	86,095	12.5	15	64,018	14.5	19
Communists . . .	27,334	4.0	5	15,148	3.4	4
Arab Democrats . . .	16,370	2.4	3	7,387	1.7	2
Others . . .	28,296	4.2	3	39,770†	9.1	3
Totals . . .	687,492		120	440,095		120

* United Religious Front.

† This includes 24,835 votes dissipated among nine splinter parties.

The party list method was used with proportional representation and women's suffrage. (K. Sm.)

ELECTRICAL INDUSTRIES. Generating Plant.

The demand for generating plant, both for home use and for export, remained insistent. Despite the assistance rendered by heavy engineering manufacturers who did not formerly make boiler-house plant for thermal power stations, shortages of labour and raw materials, occasioned partly by the rearmament drive, created difficulties. Nevertheless, the supply position showed some improvement in 1951. That the effect of the installation of new high-efficiency plant was beginning to be felt was demonstrated by the increasing overall thermal efficiency of the British Electricity authority power stations. Figures published for 1950 showed that the best station (Battersea "B") had an efficiency of 29.31%, and nine other stations had efficiencies between 26% and 28%. These stations generated over 17% of the total energy in the year ended March 31, 1951.

Manufacturing developments made it possible for the B.E.A. to place orders for 100-Mw. turbo-alternator sets, each with one boiler, instead of the previously standardized arrangement of 60-Mw. sets, each with two boilers supplying 360,000 lb.hr. Early in 1951, it was announced that the B.E.A. had placed orders for £21.5 million worth of generating plant comprising 57 turbo-alternator sets with an aggregate capacity of about 2,500 Mw. Hydrogen cooling for large turbo-alternators was being increasingly employed and among the hydrogen-cooled sets under construction were several of 60 Mw. capacity. A 70,588-kva. hydrogen-cooled alternator exported to Canada had a stator weighing almost 120

Margaret Patricia Hornsby-Smith canvassing in her constituency of Chislehurst, Kent. In the Conservative government she became parliamentary secretary to the Ministry of Health.

tons. The manufacture of water-turbine sets was also very active and a vertical reaction turbine supplied to Portugal by a British manufacturer was of 63,000 b.h.p. Difficult problems in the development of gas-turbine installations were being solved and it was expected that two 15-Mw. sets and one 12.5 Mw. would be in operation by 1951. Work on generation by atomic power showed that there was a reasonable prospect of its large scale development but the cost of energy would probably not differ widely from that generated by coal.

Transmission and Distribution Equipment. The increasing need for bulk transmission of power over long distances in several European countries was reflected in plans for stepping up transmission voltages and in the development of larger sizes of circuit breakers and other control equipment. In Sweden, France and Western Germany 225-kv. systems had been in operation for some years, but to facilitate later interconnection of national systems agreement was reached upon unification of new voltage levels. Two values had been adopted, 275/300 kv. and 380/400 kv. The plans for the B.E.A. super grid were a first step up to 275 kv. from the 132 kv. of the existing grid, but provision was being made in tower designs for subsequent conversion to 380 kv. if this should prove economically desirable. The next step in countries already having 225-kv. systems was an increase to 380 kv.

For the main transmission in the B.E.A. 275-kv. grid, the conductors chosen were twin 0.4 sq.in. per phase, having a thermal rating of 570 Mva. per circuit. The ratings of transformers for this system were limited by transport problems and those proposed were 120-Mva. 3 phase and 60 or 80-Mva. single phase, incorporating a tap-change range of $\pm 15\%$.

For the first time on the British 132-kv. grid, wooden poles were used on a 30 mi. section in south Wales, carrying a 90-Mva. circuit. The reasons for this were shortage of steel for towers and economy in construction.

Short-circuit powers on very high voltage systems may attain values of 5,000 Mva. or more and circuit breakers having adequate breaking capacities were being developed in 1951. The largest oil-break circuit breaker ever built in Great Britain was on show at the Festival of Britain site on the South Bank. It was for 275/300 kv. and had a rated breaking capacity of 7,500 Mva. (British) or 9,400 Mva. (U.S.). The increasing use, in the United States, of microwave equipment for the transmission of control information in power systems, led to a decision to make experiments with the method in Great Britain. For distribution in the development of dockland boroughs of London, the distributed transformer system was being used. Primary distribution was at 6.6 or 11 kv. with numerous transformer chambers of 500-kva. capacity connected to it. These fed an interconnected low-voltage network. The high-voltage system took the form of radial mains and was capable of interconnection.

Utilization. One of the most interesting developments was the Pimlico, London, district-heating scheme which was formally inaugurated in July. From two 1,350-kw. back-pressure turbo-alternators, installed in Battersea power station for auxiliary power supply, heat was provided for a 30-ac. housing estate and for blocks of flats, both located on the opposite side of the river from the power station. Pipes carrying hot water were run under the river through an existing tunnel. Space heating and hot water was to be given eventually to 2,900 dwellings and some communal buildings, thus serving some 10,000 people. This heat-electric generation was adopted because of its high economy and fuel saving. A large-capacity hot water accumulator facilitated co-ordination of heat and electric loads, giving a high annual

load factor for the system. The estimated annual saving of coal was 10,000 tons.

Interest in railway electrification was aroused by the publication of the report of a technical committee, which had reviewed the general problem. This committee recommended a 1,500-v. D.C. system with overhead line as the best for Great Britain. French experiments with a 20-kv. 50-c/s single phase system, using overhead distribution and transformers on the locomotives, on the newly electrified Aix-Annecy-La Roche line attracted world-wide attention. Previously experience in France had been with 1,500-v. D.C. traction, but the new system was designed to lower installation costs and reduce the number of sub-stations. An international congress on electric traction was held at Annecy in October. (See ELECTRIC TRANSPORT.)

An international conference on illumination was held in Stockholm. There was much interest in British research on high-speed flash photography using a xenon-filled tube with a hydrogen-filled thyatron for pulse control. There was interest also in luminescence and particularly in the luminous capacitors being developed in the United States. These provided a low-intensity light source based on the electro-luminescence of a phosphor under the influence of a rapidly changing electric field. For the artificial illumination of growing plants an irradiator, using a horizontal mercury vapour lamp, was developed. Electric welding was rapidly advancing in 1951 and an international congress on welding was held in London, in July.

Progress in the electrification of agriculture continued. Published figures on the use of electric motors on British farms showed that the number had increased from some 3,500 in 1931 to 91,750 in 1950. The use of electricity in mining increased and resulted in a greater output per manshift.

Research and New Developments. Both through technical papers and "open days" at several industrial research laboratories, electrical research attracted considerable attention. The researches reflected contemporary pre-occupation with generating-plant developments and with high-voltage transmission. They included investigations on metals for gas and steam turbines, on magnetic materials, using both optical and X-ray diffraction methods for determining crystal orientation, on the performance of transformers and other high-voltage equipment under impulse tests with voltages of 2 million or more and on the connections between the structure and dielectric properties of materials. High-tension switchgear and cables, mercury-arc rectifiers, high-voltage direct-current transmission, radio interference from power circuits, and wind power were other subjects of research. A plan was formulated for a group of Scottish firms to undertake electronics research.

The professorship of electrical engineering at Cambridge university, originally endowed by the Institution of Electrical Engineers in 1945, was permanently endowed by the British Electrical and Allied Manufacturers' association. In connection with the Festival of Britain, a joint engineering conference was held in London to record British contributions to engineering and science during 1851-1951. Cable for 275 kv. was being made and tested by a British manufacturer. It was of the impregnated pressure type for operation under a nitrogen gas pressure of 200 lb./sq.in.

Among other interesting new developments were the construction of a new plant for the production in Great Britain of polystyrene, the use of geranium triodes to replace thermionic valves for radio work, the construction of a resistor, of 2,000-kw. rating, for use in machine testing, a new non-metallic, high-permeability low-loss core material and a paramagnetic continuous oxygen recorder for use in industrial processes. The construction of a 400-Mev. synchro-cyclotron—the largest in Europe—for Liverpool university

was well advanced. A very versatile digital computer was built and installed at Manchester university.

Trade. The value of all electrical goods and machinery exported from Great Britain in Sept. 1951 was £12,919,529, as compared with £10,111,528 for Sept. 1950. In August and July 1951 the totals of £14,162,700 and £13,974,738 respectively were both records for any month.

Among export orders received by British firms were those for £1,600,000 of generating plant for oil fields in Indonesia, Venezuela, Colombia and British Borneo, trolley buses for Hobart, Tasmania, 14 diesel-electric locomotives for Australia and 300-kv. and 275-kv. transformers, having an aggregate capacity of 400,000 kva., for Canada. Eight 625-h.p. diesel-electric locomotives were built for Ceylon Government railways.

Refrigerator production was rising and, for the first six months of 1951, was valued at £15,752,064, of which £6,719,135 worth was exported. These values compare with a total production of £24,660,904 for the whole of 1950 when £10,102,342 worth was exported. (E. W. G.)

United States. During 1951 the indices for manufacturing activity were revised on the basis of 1947-49=100. The federal reserve board estimated the 1951 index of industrial production at 119, 11 points above 1950 and 15 points above 1948. For electrical manufacturing the index rose to 149·5, or 13·4 points above 1950 and 51·1 points above 1949. The index for electrical appliances for domestic use dropped to 137·9 in 1951 from 161·5 for 1950, but was still 37·7 points above 1949 and 29·5 points above 1948. The industrial apparatus index continued to mount by going to 176·6, 62·5 points above 1950 and 91·5 points above 1949. (See also BROADCASTING; RADIO, SCIENTIFIC DEVELOPMENTS IN; TELEVISION.) (F. J. K.)

ELECTRIC POWER. The electricity supply industry faced increasing difficulties. Limited resources in labour and materials had to be shared between the constructors of generating and distribution equipment and industries fully occupied with rearmament. Great efforts were made to reduce the deficiency in generating capacity which, however, tended to increase because of higher power demands from the engineering industries and agriculture.

The development of plans to utilize new sources of energy, such as atomic and geo-thermal energy, peat and wind, and to improve supplies by super-tension international grids continued, but perhaps the most interesting progress was in rural electrification schemes in such widely separated parts of the world as Manitoba, Madras, Northern Ireland and the Republic of Ireland, South Africa, the U.S.S.R. and Australia. The economic value of rural electrification in the sparsely populated areas being developed was doubtful when considered solely from the point of view of the revenue immediately obtained, but the advantage of a well-mechanized agriculture as a national asset was unquestioned.

Great Britain. The power position was rendered more difficult in Great Britain by a threatened shortage of coal. Power cuts were rather less severe in the early part of the year but warnings were given that they would become more frequent and extensive in the winter unless load-spreading by industrial consumers increased. During a cold spell a plant shortage of 2,400 Mw. might occur. To ease the position a reduction of 600 Mw. in the national simultaneous maximum demand was called for and the installation of auxiliary generating plant by industrial consumers was encouraged. The need for some form of load-controlling device for domestic consumers was recognized and experiments were made to determine its most appropriate form.

The rate of installation of new generating plant by the British Electricity authority, which was 965 Mw. in 1950,

was expected to rise to between 1,600 and 1,800 Mw. a year. The capital invested in the British supply industry was over £1,000 million, being increased by some £127 million during 1951. The industry employed 176,000 people and used over 16% of the home-consumed coal.

The importance of new generating plant in coal-saving was emphasized by the fact that, whereas the average thermal efficiency for the whole country was 21·5%, that for the 50 best stations was 25%, rising to between 28% and 29% for the best individual stations.

The B.E.A.'s third annual report to March 31, 1951, showed that 46,580 million units were sold out of more than 53,000 million generated. The number of consumers rose to 13,079,473 and the average revenue a unit sold was 1·181d. Electricity consumption in agriculture showed the greatest rate of increase, 28·3%, as compared with the previous year; it was still, however, only about 1% of total consumption. The percentage increases for commerce and industry were 16·7 and 11·8 respectively. A provisional 10-yr. programme for the B.E.A. 275/300-kv. super grid was adopted. Certain sections were being designed for possible operation eventually at 380-400 kv. Construction of the first 275-kv. line from Staythorpe to Sheffield made good progress and contracts were being placed for further sections to be in commission by 1955. In nine months to Sept. 30, 1951, the total energy sent out by generating authorities in Great Britain was 40,924 million units, an increase of 11·6% on the corresponding period of 1950. The installed capacity of B.E.A. generating plant was 14,987 Mw. at Sept. 30.

At the beginning of the year the North of Scotland Hydro-Electric board had 199·7 Mw. of generating plant in operation, with 229·3 Mw. under construction, schemes for 206·3 Mw. promoted and surveys being made for schemes to provide a further 278·5 Mw. The number of consumers was 244,314 representing 855,000 people. In 1950 the units sold totalled 722,514,458 at an average rate of 1·2704d. a unit. The largest hydro station in operation was Loch Sloy (130·45 Mw.) and the second largest was Cluanie (61·2 Mw.). The board estimated that by 1958 the total capacity of their water power plant would be almost 1,000 Mw., giving an annual output of 3,000 million units. The Affric station was almost complete in 1951 and the first of its three 22-Mw. sets was running.

In 1950 the board sold 136 million units to B.E.A. and it was expected that in the winter of 1951-52 the load which could be provided, on demand, to B.E.A. would be 185 Mw. Electricity supply to the remote parts of northern Scotland was uneconomic. The average cost of connecting a rural consumer was about £300, three times the prewar cost. Consumers were asked for annual guarantees but, under the Hill Farming act, 1946, grants could be obtained towards the cost of improvements to farms, including electricity supply. In May the board's new diesel generating station at Kirkwall, Orkney, was opened. This was the largest diesel station for public supply in Britain having an initial capacity of 3·75 Mw. with an ultimate capacity of 7 Mw.

Commonwealth. *Canada.* A review of Canada's water power resources showed that it would be feasible to install turbines up to a total capacity of 55 million h.p. At the end of 1950 the total installed was 12,562,750 h.p. Hydro-electric construction was very active and new projects were in hand during 1951 in Quebec (50,000 h.p. at No. 2 rapids on the Upper Ottawa river and 35,000 h.p. on the Megiscane river), British Columbia (56,000 h.p. on the Campbell river) and Manitoba (38,000 h.p. at Pine falls). In Manitoba progress was made in rural electrification, the aim being to connect 5,000 farms a year. In Alberta about 3,500 farms were connected during the year, bringing the total to 15,700.

The Brighton "B" generating station (in foreground) under construction at Shoreham harbour, Sussex. The first half of the station was due to be completed in 1953. In the background is the existing Brighton generating station.

Australia. Good progress was made on the Snowy mountain hydro-electric scheme and an order was placed for two 30-Mw. turbo-alternators for the first pilot station at Guthega at an altitude of 4,000 ft. Two vertical Francis water turbines, each of 82,000 h.p., were ordered for Eildon power station on the Goulburn river in Victoria. The purchase of a floating barge power station of 20 Mw. capacity was under consideration by the New South Wales Electricity commission. Rural electrification progressed in New South Wales and in Victoria where 127,000 rural consumers, including 16,000 farms, were being served. In Tasmania rationing of power became necessary, although the position was to be improved when several hydro-electric schemes were completed in 1954.

New Zealand. Shortage of power in New Zealand caused load restrictions. Experimental geo-thermal bores gave good results and encouraged development. Work progressed on the 220-kv. grid to connect hydro-electric stations under construction.

South Africa. Difficulty was experienced in obtaining plant for power station extensions. For the Rand undertaking alone 215 Mw. of new plant was needed for existing stations and 570 Mw. for new stations. The total installed capacity was 1,514 Mw. but plant on order was to increase this to 2,488 Mw.

Central and West Africa. A report on the Kariba gorge scheme on the Zambesi was published recommending that the first part, to produce 385 Mw. and to cost £43·5 million, should be put in hand immediately. In Uganda progress on the Owen falls hydro-electric scheme was maintained and was well up to schedule. A report was being prepared for the Gold Coast government on the Volta river scheme (750 Mw) which would provide power for aluminium production.

India. In India's first five-year development plan provision was made for spending £338 million on irrigation and power. Power projects would increase generating capacity by

1,100 Mw. (70% of existing capacity). The Madras government proposed to spend over Rs. 10 million during the year for electricity supply to rural areas.

Pakistan. The total generating capacity was estimated at 69,074 kw. Plans were made to utilize the country's extensive water power resources and to erect a grid system.

Europe. Although Europe has considerable power resources in hard and soft coal, peat, oil and water these were not uniformly distributed and the need for development of all such sources, with an international grid network for the interchange of power, remained. Of the countries possessing large water power resources Norway and Austria were most likely to be able to export power. Large-scale transmission from Norway to Britain and the continental mainland would have to await the development of h.t.d.c. transmission. Some of the most easily developed Austrian water power sources had a potential capacity of more than 4,000 Mw. of which over 60% would be available in winter. The corresponding annual energy production would be some 17,000 million units. In Norway an underground 50-Mw. power station was undergoing final tests.

In Switzerland the annual generation of electrical energy exceeded 12,000 million units.

Electricity consumption in France in 1950 was 33,000 million units and the first few months of 1951 showed an increase of more than 15% on the comparable period in 1950. In September the fifth 65-Mw. generator was put into commission at Génissiat, on the Rhône, bringing the total capacity of the station up to 325 Mw.

The first of three 32,000-kva. generators was commissioned in June at a new hydro-electric station at Vila Nova, Portugal. A total increase of generating capacity of 180 Mw. in southern Holland was planned to supply increasing industrial demands. Hydro-electric projects had been planned in Luxembourg for the rivers Sûre and Our. Most of the energy generated would be available for export. New Soviet power plants under construction at Kuibyshev, Stalingrad, Kakhovka and

along the main Turkmenian canal would supply 22,000 million units a year mainly for agricultural purposes and irrigation. In the Republic of Ireland, during 1950-51, 32,737 new consumers were connected and the total annual output was 969 million units. A third turf-burning power station, at Firbane, was planned. The Rumanian government published a 10-yr. plan for electric power development increasing the installed power from 740 Mw. to 2,600 Mw. (E. W. G.)

United States. Power production rose to record heights in 1951. Weeks in which output was 7,000 million kwh., were eclipsed by the week before Christmas when output reached 7,800 million kwh. The Federal Power commission reported that in the 12 months ending Nov. 30, 1951, electric utility plants produced 367,852 million kwh., a gain of 13.9% over 1950. Generating capacity rose to 75.2 million kwh., as against 67.9 million kwh. in service 12 months before. Industries and railways generating energy for their own use had 14.2 million kwh. installed. Continuing its expansion programme, the electrical industry spent vast sums to increase generating capacity, principally in steam plants.

Large hydro-electric projects authorized by the Federal Power commission included the Roanoke Rapids dam, licensed to the Virginia Electric and Power company, which was appealed to the courts by the secretary of the interior and Rural Electrification administration co-operatives; the Kings river projects of the Pacific Gas and Electric company in California; the Pelton project of the Portland General Electric company on the Deschutes river in Oregon; and the city of Tacoma's \$143 million project on the Cowlitz river. Installed capacity involved in hydro-electric projects under commission licence rose to more than 7 million h.p. Ultimate proposed installation of all licensed projects advanced during the fiscal year from 8,678,000 to 9,932,000 h.p. and the total cost of all major projects under licence rose from \$958 million to \$1,134 million. In its studies of river basin development and hydro-electric possibilities of flood-control projects the commission staff participated in 101 co-operative investigations with the corps of engineers and 50 basin surveys or project investigations with the bureau of reclamation. Six power market surveys were completed. (J. W. J.)

ELECTRIC TRANSPORT. The most important event of 1951 was the conference organized by the French national railways in October at Annecy to demonstrate the progress made in electric traction at 50 cycles. Experiments with a 50-v. 20-kv. overhead contact wire on the Hollental line in Baden had been initiated by the German federal railways in 1933 and were continued there after World War II by the French railways and afterwards on the Annecy line. The success of these tests indicated that the system was practicable for complete electrification. It was claimed that the overall economy in capital cost of the 50-cycle system over 1,500 v. d.c. for an average French line was about 38%.

The economic case would vary for each particular scheme as the saving on substation feeders and track equipment had to be balanced against the increased cost of obtaining physical clearances for high-voltage track conductors. It was stated that the increased cost of rolling stock equipment would be very small and also that, in France, the cost of overcoming telecommunication interference and of altering signalling installations would be little different from the cost at 1,500 v.

Electric traction loads on industrial networks had an important bearing on national economy and a paper on the subject was read at the World Power conference at Delhi early in 1951. The displacement of the rotary converter removed the necessity for a low frequency supply for d.c. railways. This development eliminated the need for low frequency generators or converters on a.c. lines and also the

necessity for a railway-owned high-voltage distribution system.

Great Britain. The report of the committee appointed by the British Transport commission was published early in the year. It gave a detailed account of technical progress in electrification in the intervening period. The committee recommended the adoption, as standard, of the 1,500-v. d.c. overhead system for future electrification, except for an area to be allocated for the third-rail system of the southern region. The retention of the fourth rail on the existing London Transport railways and its use on any extensions was recommended. The committee did not rule out the possibility of 3,000 v. d.c. or single-phase 50-cycle a.c. for light secondary lines.

In November, British Railways decided to make a trial of the single-phase 50-cycle system on the Lancaster-Morecambe-Heysam line operated from 1908 at 6.6 kv. 25-cycle single-phase, the equipment of which was life-expired. A committee appointed to investigate transport facilities in Glasgow and the Clyde valley submitted, to the British Transport commission, an electrification scheme estimated to cost £10 million and to save 70,000 tons of coal a year.

Erratum. In the *Britannica Book of the Year 1951*, page 225a, it should have been stated that Great Britain in 1927 possessed 15,000 tramcars, not 15,000 modern tramcars, etc.

Austria. Electrification expenditure for 1951 was estimated at £8 million. Work continued on two railway-owned power stations, one near Uttendorf in the Tauern area and the second near Braz on the Arlberg main line. In July, electrification was extended eastwards from Linz to Amstetten (40 mi.) and conversion work was continued between Amstetten and Vienna (79 mi.), the only remaining steam-worked section of the great trunk route Vienna-Bregenz (478 mi.). In Carinthia, work was begun on the Villach-Tarvisio line (17 mi.), the last link of the electrified route from Salzburg connecting at Tarvisio with the Italian state railways' electrified main line to Udine.

Denmark. At the request of the Danish state railways, a traction committee was appointed by the Danish Academy for Technical Schemes to investigate the technical and economic problems involved in a change of railway motive power. It was independently estimated that about £2 million could be saved annually, mainly on the cost of fuel, by the electrification of the main lines.

France. Electric working between Paris and Dijon had led to a considerable cut in timing and work was well advanced on the Dijon-Lyons section of the Paris-Lyons electrification. There were 2,380 mi. of main line and 125 mi. of suburban route electrified by 1951. This represented 10% of the whole French national system and carried about 24% of the total traffic.

In May, the 50-cycle single-phase electrification from Aix-les-Bains to Annecy was extended to La Roche-sur-Foron and future extensions were planned from La Roche-sur-Foron to Annemasse and to St.-Gervais. The electrification of the Dunkirk-Lille-Mézières-Thionville line in the northern and eastern regions was being considered on this system. The scheme, in which the German federal railways were interested, also envisaged the inclusion of the line from Thionville to Trier and Koblenz in Western Germany.

A number of experimental locomotives and motor coaches had been built or adapted for trial on the single-phase 50-cycle Annecy line. Two C₀-C₀ locomotives were dual-purpose machines, one Oerlikon-built and the other by Alsthom. Each locomotive worked normally from a 20-kv. 50-cycle overhead line but could operate at reduced power by means of a motor-alternator set when working on a 1,500-v. d.c. line. The third 80-ton B₀-B₀ Alsthom-built locomotive was for operation solely on 20-kv. 50-cycle lines. It was equipped with two pumpless air-cooled rectifiers and had a continuous rating of 2,660 h.p. at 37 m.p.h. Two railcar sets were

equipped with traction motors working direct from a 50-cycle supply. In addition, an ignitron equipment manufactured by the Westinghouse company was installed for trial in a motor coach. Complete renewal of the Paris Metropolitan rolling stock was planned and the first order was for 200 3-car articulated units valued at £9 million.

Italy. The first electrified section of the Italian state railways in Sicily was opened between Messina and Barcelona-Castroreale (28 mi.). Work was also in hand on the next stage to Sta. Agata di Militello (38 mi.). These sections formed part of the Messina-Palermo (144-mi.) single-track main line of which the line between Palermo and Fiumetorto (27 mi.) was being doubled. Power for this electrification was supplied from a new thermal station at Messina. The building of a similar thermal plant at Palermo and a hydro-electric station on the River Troina was in hand. In addition aerial power cables bridging the Straits of Messina to link the Sicilian supply with the mainland grid were under construction.

Two of the earliest electrified lines were converted to 3,000 v. D.C.: the 750-v. third-rail service between Milan and Porto Ceresio, opened in 1901-02, and also the Monza-Lecco section of the Milan-Sondrio line, formerly part of the three-phase 16 $\frac{2}{3}$ -cycle 3,700-v. system. The overall time between Lecco and Bergamo was cut by the elimination of the change-over at Monza and by higher running speeds. On the privately owned Nord-Milano railway, the line Saronno-Laveno (31 $\frac{1}{2}$ mi.) via Varese Nord was electrified.

Netherlands. The preference of the Netherlands railways for the 1,500-v. D.C. system was due to the close spacing of points at which power was available and also to the widespread use of multiple-unit stock. But since 1947, when the British Railways' locomotive had been lent for tests, proposals were made for the use of electric locomotives. In 1948, the first of ten 1A-B₀-A1 locomotives with a high-power rating and a maximum speed of 100 m.p.h. was introduced. But owing to the difficulty of maintaining the permanent way for high speeds the next order for 50 B₀+B₀ locomotives built by Alstom for mixed traffic work had a maximum speed of 75 m.p.h. and a lower power rating. Delivery of these locomotives continued during 1951. To meet new demands for heavy freight trains 10 C₀-C₀ locomotives were ordered from Alstom and 25 C₀-C₀ commissioned in the Netherlands under licence from Baldwin-Westinghouse. Pre-stressed concrete portals were being used in the equipment of lines in the north and the east. These were similar to the French Weinberg system used on the Paris-Dijon electrification, but with diagonal bracing. The total amount of steel needed was only 16% of that for a steel portal. There were 659 route mi. electrified, and 148 route mi. under conversion in 1951.

Norway. Electric traction was introduced on the Lillestrom-Charlottenberg (71-mi.) line via Kongsvinger in June. The conversion, on the 1,500-v. 16 $\frac{2}{3}$ -cycle single-phase system, began in 1948, cost about £1,253,000 and enabled trains to be worked electrically between Oslo and Stockholm with a saving in journey time of about one hour. Nearly half the total traffic in Norway was carried on 640 mi. of electrified track representing about 23% of the whole mileage. Other lines planned or under conversion were Bergen-Voss, Millestrom-Hamar (Trondheim line) and Egersund-Stavanger (Sorland line).

Poland. The electrification of the Katowice-Warsaw line via Czestochowa, and the Katowice-Wejherowo-Pruszcz lines was planned in a six-year economic project. Meanwhile, preliminary work on the Warsaw underground railway made progress and shafts were sunk in the centre of Warsaw and in the suburb of Praga. Motor coach equipment for the Warsaw electrified lines, to replace wartime losses, was delivered.

Spain. Early in 1951, the Spanish government published its "Development of the General Reconstruction Plan"

covering the railway modernization and electrification programme previously approved and more recent developments. On the Torre Branuelas section of the Leon Ponferrada mountain line with a heavy coal traffic, the capacity had been tripled with important economy in operation. The national railway administration planned to electrify, at 3,000 v. D.C., the trunk line from Hendaye on the French border to Algeciras (820 mi.) and sought foreign credit for the work.

Switzerland. In October, the Winterthur-Bauma-Wald standard gauge line (25 mi.) was converted to electric traction. Station buildings were modernized, bridges reconstructed and passing loops lengthened. Power-operated points and colour light signalling were installed.

The Swiss government agreed to the construction of a new railway from Sembrancher to Le Chable in the Valais. The line would facilitate tourist access to Verbier and the transport of materials for building the Mauvoisin dam.

The federal railways took delivery of six new lightweight steel restaurant cars, seating 52. Each car weighed 31.5 tons fully equipped. Electricity at 220 v. for the all-electric kitchen, maximum load 39 kw., was taken from a transformer in the 1,000-v. train heating circuit when the train was running at a speed above 25 m.p.h. When stationary, or running below this speed, current was taken from a pantograph mounted on the car itself which was automatically lowered if the speed exceeded 25 m.p.h. or the line supply failed.

Australia. In February, approval was given to the plan for the electrification of seven sections of line in the Brisbane suburban area involving 225 single-track miles. The total cost, with ancillary works, was estimated at nearly £9 million, to be spread over a period of about nine years. A contract valued at £3 million was placed for 1,500-v. overhead track equipment for the extension of the Sydney suburban system. The line from Paramatta to Lithgow, in the western coalfield of New South Wales, was to be electrified and heavy coal trains hauled over the arduous route in the Blue Mountains area. There were 236 single-track miles to be equipped, including four tracks between Paramatta and Doonside and two tracks from Doonside to Lithgow.

The Victorian government railways decided to extend the 1,500-v. D.C. system beyond Frankston, but the existing route from Frankston to Mornington was to be abandoned and an electrified coastal route built 4 $\frac{1}{2}$ mi. shorter. The line (8 $\frac{1}{2}$ mi.) would be single-tracked. A new line from Moe to the Yallourn coalfield (5 mi.) was under construction and would be electrified.

India. Twenty-eight four-car multiple units, each with two 1,500-v. 700-h.p. motor-coaches with two intermediate trailer coaches were supplied for the Bombay suburban services of the Bombay, Baroda and Central India and Great Indian Peninsula railways. Built in Great Britain, the coaches were nearly 26% lighter than the conventional types in use. They were subjected to a comprehensive series of practical tests at the makers' works in a specially designed test rig, capable of applying buffing loads up to 150 tons.

New Zealand. Labour difficulties slowed down progress on the electrification of the Wellington-Hutt Valley line and also delayed completion of the Maraetai hydro-electric scheme. Despite existing 1,500-v. D.C. systems, it was decided all future electrification would be single-phase A.C. (J. W. GE.)

United States. Continued expansion of trolley coach operation was the most notable development of 1951. At the beginning of the year a total of 6,500 electric trolley coaches were being operated on 42 transit systems. This was more than double the number of vehicles in operation ten years earlier. During this period the mileage of trolley coach routes had increased by 80%. In 1951 about 636 additional coaches were placed in operation bringing the total at the end of the year to more than 7,100.

Delivery was started on the largest single order for trolley coaches ever placed in the United States, 349 units for Chicago. A notable instance of trolley coach expansion during the year was the inauguration of service on the heavily travelled Grand river route at Detroit. A total of 80 new trolley coaches replaced street cars on this route. Another significant development was the completion of the conversion from steel-wheeled to rubber-tyred vehicles at Des Moines, Iowa.

In late years the operation of surface electric railway cars had been concentrated more and more on the heavily travelled lines in large urban centres. At the beginning of 1951 a total of 13,800 electric surface cars were in operation on 84 electric transit systems. Rolling stock added during the year included 25 cars of the so-called president's conference committee type for San Francisco and 50 of these cars for Boston. These brought the total of the modern vehicles in operation to 4,354.

In the cities of more than 1 million population, rapid transit lines carried more passengers than any other type of public transportation service, and many improvements were being made in rapid transit facilities. All of the new construction begun or proposed during the past few years was in subway or open cut. Elevated railways were being gradually eliminated. The same number of passengers were being carried in 1951 over the same mileage of track by about 10% fewer cars than were in use ten years before. The most notable of the developments in the rapid transit field during 1951 was the inauguration of service on the new Milwaukee-Dearborn-Congress subway route in Chicago. This was the second and final step of the initial phase of that city's subway building programme.

Delivery was made during the year of the remainder of a New York Central order for 100 multiple-unit cars of 600-v. D.C. operation in the Grand Central terminal zone. This resulted in a substantial improvement in service in the New York suburban area. Delivery was also made on most of a Pennsylvania railroad order for 100 multiple-unit cars for operation on 11,000-v., 3-phase, 25-cycle A.C. Eight straight electric locomotive units were delivered during the year for freight service on the Pennsylvania railroad. They were designed for operation on 11,000-v., single-phase, 25-cycle A.C. Four of these units, rated 3,000 h.p. each, were equipped with rectifiers and D.C. traction motors. Four, rated 2,500 h.p. each, were powered by single-phase A.C. traction motors, and as many as four units could be operated in multiple. (See also RAILWAYS.)

(J. A. Mt.)

ELECTRONICS. The technique of electronics had permeated, by 1951, throughout the fields of pure and applied science, and devices such as thermionic valves, gas-discharge tubes and photo-electric cells were used for a wide variety of operational, control and measurement purposes. The year 1951 saw not so much the spectacular invention of a new device as a steady improvement in, and extension of, the application of existing instruments and components. This improvement included the developing of measuring instruments of many types, so that various phenomena involved in electronics might be subject to increasingly accurate quantitative assessment. The impact of atomic research on the electronics industry was made very evident by publications and by the large range of instruments shown at exhibitions. The wide use being made of radio-active materials and machines for producing ionizing radiations created a demand for various types of nuclear particle and radiation detectors.

Among many different types of detector used in nuclear physical work, two were dependent on gas-ionization and photo-conversion respectively. In the former type, the ionization produced by the active radiation between two

electrodes in a gas was measured as in the original form of Geiger-Muller counting tube. A multiple counter was made available during 1951, in which ten counting tubes with samples could be automatically selected in time-sequence, the resulting counts being registered by a pen-recorder. The use of this instrument not only saved time, but avoided the difficulties due to contamination when the same Geiger-Muller tube was used for different samples in turn.

In the photo-conversion type, or scintillation counter, the particles from the radio-active specimen are absorbed by a phosphor, the scintillations from which are converted into pulses by a photo-electric multiplier tube and then registered electronically in the usual way. In one type of instrument developed for counting alpha-particles, a light-tight slide was used to present a sample accurately below a multi-crystalline deposit of activated zinc sulphide. Alpha-particles striking this deposit produced minute flashes of light, which were reflected on to the photocathode of a multiplier photocell. Such scintillations produced output pulses of several volts, and these were passed through a discriminator to reduce or reject the noise background signals from the multiplier tube. One type of alpha-particle counter developed on these lines had a useful range of from ten counts per hr. to 100,000 counts per min., with a background rate of less than four counts per hr.

Another application of electronics technique was in the field of meteorology. An instrument for measuring meteorological conditions on the ground, rather than in the air (see RADIO), was the photo-electric hygrometer, which automatically measured the frost-point of the air. Light scattered from a deposit of natural frost on a cooled metal thimble was collected by photo-electric cells, the output of which was made to control the current in a heater coil inside the thimble so that the frost deposit was kept constant. Another resistance coil then measured the temperature of the air.

Apart from the specific examples described above, electronic tubes and apparatus were applied to the very large field of servo-mechanisms. In this application, a combination of electronic and mechanical equipment was used for automatic regulation and control purposes in many industrial processes. Examples of these were the control of speed of rolling mills, wire-drawing machines and printing presses, where departure from the desired speed was detected electrically, the response amplified and the output used to control the driving mechanism. For such purposes the electronic device, with its rapid response and suitability for amplification to any desired extent, was almost ideal; and research and development showed that this was being found a most useful and reliable aid in the factories of industry as well as in the laboratories of research scientists.

(R. L. S.-R.)

United States. An electronic development of biological interest, reported at the Cleveland meeting of the American Association for the Advancement of Science, was a miniature radio station that was carried by an experimental subject and broadcast his brain waves or other signals, such as those indicating electrical activity associated with heart beats; a receiver picked up the signals and presented them on a television-type screen. The apparatus was described by N. J. Holter, of the Holter Research foundation, Helena, Montana, and J. A. Gengerelli, of the University of California, Los Angeles.

In a paper presented at the 1951 National Electronics conference, held in Chicago in October, James L. Murphy and Hilary W. Pavela, of the Armour Research foundation, announced a method for magnetically recording on tape the minute electrical impulses originating in the muscles of the body. The device was developed for the University of Illinois, and at the end of the year was in use in the university hospital.

A method of using television techniques to extend the range, power and adaptability of the light microscope was announced by A. K. Parpart, chairman of the department of biology at Princeton university. It was developed with the co-operation of L. E. Flory and J. M. Morgan, of the laboratories division of the Radio Corporation of America. The experimental installation was used primarily by Parpart at the Marine Biological laboratory, Woods Hole, Massachusetts, in studying a wide variety of marine life. It consisted of a laboratory microscope mounted beneath an R.C.A. industrial television camera, about the size of a small 16-mm. motion picture camera, from which the picture was transmitted by cable to a standard receiver. The camera pickup tube, called a Vidicon could be made sensitive only to a particular narrow band of colour. A red-sensitive and a violet-sensitive tube were used by Parpart. In some cases he employed a binocular microscope with a camera above each of the two eyepieces, and connected to two receivers. Thus red and violet images could be examined side by side.

Using a single narrow band of colour, it was explained, it is possible to study in a living cell a particular material whose light absorption lies in that band, giving a degree of contrast between various chemical components of the cell that is superior to methods formerly used.

The velocity of light (C) is one of the most important physical constants, and a Stanford university physicist, Edward Ginzton, announced that electronic means had been used to determine its value with what was believed to be 10 to 20 times the precision of former methods. The speed was given as 186,280 mi. per sec., compared with 186,272 mi. per sec., considered the best previous value. The new determination was estimated to be accurate to within 0.0002%. Instead of visible light, radio microwaves a few inches long were used. These, like light and all forms of electromagnetic radiation, are known to travel at the same speed. Just as sound from a tuning fork is greatly reinforced when it is held over a tube of such a length that the natural pitch of the tube corresponds to that of the fork, so a resonant cavity for radio waves can be constructed. The wave length multiplied by the resonant frequency gives the speed of light. The cavity used in the new experiments was a cylinder 4.5 in. high and 9.8 in. in diameter. William W. Hansen, former professor of physics at Stanford, was credited with originating this technique, and most of the research was performed by Kees Bol and William J. Barclay. It was sponsored by the Sperry Gyroscope company.

The year 1951 saw the inauguration of a new and extremely precise master timekeeper in the Bell Telephone laboratories at Murray Hill, New Jersey. This was expected to vary less than a ten-thousandth of a second a day, which corresponds to a precision of a second in 30 years. The timekeeper was known as the Bell System Primary Standard of Frequency. At the heart of the standard were four quartz crystals excited electrically to vibrate at 100,000 cycles per second. These vibrations, through circuits containing 600 electron tubes, controlled the frequency of a special alternating electrical current with a precision of one part in 1,000 million. The entire equipment was housed in air-conditioned rooms where the temperature never varied more than two degrees. The new frequency standard was said to be about ten times as precise as its predecessor, which operated similarly and had been in use since 1937 at the New York headquarters of the Bell laboratories.

In October the General Electric company announced completion for the U.S. air force of the largest and most complex radar systems yet produced. A number of these had been installed by the air force as major units of the radar "fence" protecting the U.S. and Canada against unexpected enemy air attack. Installations in the arctic regions were

housed in rubberized fabric balloons, 54 ft. in diameter and 36 ft. high supported entirely by air pressure and capable of withstanding winds of 125 m.p.h.

Minute cracks in gun barrels, or other iron or steel tubes, could be quickly detected and plotted with a device developed by R. D. Kodis, formerly of the Watertown arsenal, Massachusetts, and R. Shaw, of the Graydon Smith Products company. An electric current passed through the barrel magnetized it; cracks and other defects caused a distortion of the magnetic field. On a "crawler," pulled through the barrel by a chain at a speed of as much as six feet per minute, was a pickup coil that spun round close to the bore of the gun, at a speed of up to 1,800 r.p.m. This detected the irregularities of the magnetic field and a visible record was made on a strip of paper. When complete the record showed the defects as dark markings, as if the inside surface of the barrel were laid out flat.

A new amplifying device, called the junction transistor, was announced by the Bell Telephone laboratories, who credited William Shockley with its development. It had the form of a plastic bead about $\frac{3}{16}$ in. in diameter with three wires extending from it and was capable of amplifying a weak electrical signal about 100,000 times. The smallest electron tube of the usual type that would perform the same job was about 400 times as big. In addition, even though the original signal might have a power of as little as a millionth of a watt, a full watt of power was ordinarily required to amplify it in a conventional tube. The junction transistor, it was stated, would itself operate on about a millionth of a watt. The heart of the junction transistor was a tiny rod of germanium, an element belonging to the class of materials known as semi-conductors. The rod was treated so that both ends were electrically negative, with a thin positive layer sandwiched between them. The two "junctions" between the middle layer and the ends gave the device its name.

An electron tube of ceramic material instead of the usual glass, capable of producing radio waves about a foot in length and with power of one kilowatt, was announced by the General Electric company's electronics department. The first ceramic tube of its kind to operate at such power, it was intended for use in television transmitters in the ultra-high-frequency range. (J. STO.)

ELIZABETH ALEXANDRA MARY, PRINCESS, Duchess of Edinburgh, the heiress-presumptive to the British throne (b. 17 Bruton street, London, April 21, 1926). For earlier career see *Britannica Book of the Year 1951*. In the latter part of 1950 Princess Elizabeth had been staying in Malta where the Duke of Edinburgh was stationed. She came to London on Feb. 12, 1951, and returned to Malta on March 19; there she presented a new king's colour to the Mediterranean station, Royal Navy, on April 5. On April 11 she and the duke went to Rome for a two-week private visit during which they lunched with the Italian president and Donna Ida Einaudi, were received by Pope Pius XII, saw the Villa d'Este, St. Peter's and the Anzio war cemetery and, with Signora De Gasperi, wife of the prime minister, visited a number of social welfare organizations. On a visit to Florence for two days they stayed with the duke's aunt, ex-Queen Helen of Rumania. The princess returned to England on April 24. She re-opened Windsor guildhall on May 16 after its reconstruction and, May 18-20, made a tour of Sussex. During an illness of George VI she deputized for

Princess Elizabeth, in a uniform based on that of a colonel of the Grenadier guards, returning to Buckingham palace, after deputizing for the king at the trooping the colour ceremony at Horse Guard's Parade, London, June 7, 1951.

him on a number of occasions: she presented new colours to the third battalion, Grenadier Guards, May 25; read the king's speech at a state dinner at Buckingham palace to welcome King Haakon of Norway, June 5; and took the salute at the trooping the colour on the king's official birthday, June 7. On July 5 she was elected president of the English Speaking union.

Princess Elizabeth and the Duke of Edinburgh were to have left Great Britain by sea on Sept. 25 for a tour of Canada, but because of the king's lung operation the tour was postponed and they left by air on Oct. 8, arriving at Montreal the same day (see CANADA). They arrived back on Nov. 17 and drove through the streets of London by an extended route to Buckingham palace. Two days later the princess and the duke drove in state to Guildhall, where the lord mayor of London, Sir Leslie Boyce, gave a lunch to welcome them home. On Sept. 29 Princess Elizabeth had been made a member of the Council of State which was to relieve the king of many of his formal duties after his operation and, on Oct. 9, it was announced that she and the Duke of Edinburgh would carry out the tour of Australia and New Zealand the king had hoped to undertake in 1952.

ELIZABETH, QUEEN, consort of George VI (b. St. Paul's, Waldenbury, Hertfordshire, Aug. 4, 1900, as Lady Elizabeth Angela Marguerite Bowes-Lyon, daughter of the Earl of Strathmore and Kinghorne), was betrothed to the Duke of York, Jan. 15, 1923, and married, April 4, 1923. The duke and duchess made a long series of tours and visits abroad—Belgrade, Oct. 1923; Northern Ireland, July 1924; Africa, Dec. 1924-April 1925; world tour, Jan.-June 1927; Berlin and Oslo, 1929; colonial exhibition, Paris, 1931; and the international exhibition, Brussels, 1935 (her first flight). Her daughters, Princess Elizabeth and Princess Margaret (qq.v.), were born on April 21, 1926, and Aug. 21, 1930.

She became queen on Dec. 11, 1936, on the Duke of York's accession after the abdication of his brother, Edward VIII. The coronation was at Westminster abbey on April 12, 1937. Queen Elizabeth thereafter shared fully in the arduous duties of the king and accompanied him on his tours abroad (except in wartime) and at most public engagements (see GEORGE VI). A counsellor of state in the king's absence in North Africa in June 1943, she held an investiture, the first held by a queen in Great Britain since the reign of Victoria. Again a counsellor of state in 1944 when the king went to Italy, she signed a commission giving assent to new statutes. She was appointed a master of Middle Temple, 1944; colonel-in-chief, Queen's Own Hussars, 1947; and a doctor of law of Cambridge university, the first woman admitted to full membership of the university, Oct. 1948. She was treasurer of Middle Temple in 1949 and dined in hall in that and later years; on Feb. 2, 1951, she attended, in hall, a performance of *Twelfth Night*. On April 17, she opened the University College of North Staffordshire at Keele near Stoke-on-Trent.

As the king was suffering from the after-effects of influenza Queen Elizabeth, accompanied by Princess Margaret, carried out his engagements in Northern Ireland on June 1-3, presenting a charter to the city of Belfast on June 1. On July 13, in London, she laid the foundation of the National theatre which was to be erected on a site between the Royal Festival hall and Waterloo bridge. She again became a counsellor of state on Sept. 27 after the king's lung operation. On Nov. 22 she was present at the Royal concert at the Royal Festival hall, London, in aid of the Musicians' Benevolent fund. When she presented prizes at St. Mary's hospital, Paddington, on Dec. 5 she paid tribute to the nursing profession: "Of late I have seen much of their skill and care and I speak from my heart of what I know."

EL SALVADOR: see SALVADOR, EL.

EMPLOYMENT. During 1951 the demand for labour in western Europe continued to rise, under the influence of rearmament programmes and further industrial recovery. The rise was particularly great in Western Germany, where the level of employment outside agriculture had risen by the middle of 1951 to 14.4% more than that of 1948 and by 7% more than that of 1950. In some countries, e.g. Great Britain, there was not much scope for a further increase; and in Nov. 1951 there were 400,000 unfilled vacancies notified to the employment exchanges, while the aircraft industries were estimated to need an additional 175,000 in the near future to meet the demands of rearmament. The coal mines, the railways, and the textile industries, as well as the metalworking industries, were all short of manpower. There remained, however, considerable numbers unemployed in certain countries of western Europe, notably Italy and Western Germany and, on a smaller scale, Belgium. Attempts to import Italian labour to the British coal mines made very slow progress. Industrial employment increased in the Scandinavian countries and in France and Switzerland. There were also increases in the British dominions—Canada, Australia, New Zealand and South Africa.

In examining Table I it must be borne in mind that the statistics are by no means on a uniform basis and that some of them have only a narrow coverage. They should be taken as indications of trends rather than as absolute measurements. These considerations apply even more to Table II. It should also be borne in mind that seasonal fluctuations were very much greater in some countries, such as Austria, Canada and Scandinavia, than in others, such as Great Britain. The figures for January to June were affected in such cases by having temporary unemployment in the first quarter of the year.

TABLE I. EMPLOYMENT IN WESTERN EUROPE AND THE BRITISH DOMINIONS (Index numbers)

General	Base Date	1948	1949	1950	1951 (latest month)

* Excluding agriculture. † Industry and transport only.

During 1950 and the first half of 1951 considerable progress was made towards the further liberalization of inter-European trade, with beneficial effects on employment in western continental Europe. European rearmament programmes called for considerably increased manpower in the engineering, aircraft and vehicle-building industries; but up to nearly the end of the year the rearmament programmes of the continental countries had not in fact made much progress. Employment in the steel industry, especially in Great Britain, was adversely affected by the acute shortage of scrap, of which only reduced quantities could be got from Germany in view of the rising internal demand.

In Great Britain, the working population increased from 22,962,000 at the end of 1949 to 23,180,000 a year later, and 23,449,000 in Aug. 1951. The numbers in the armed forces at the same dates were 725,000 (1949), 752,000 (1950), and 835,000 (1951), the increases being due to rearmament. The numbers unemployed or on release leave at the same three dates were 371,000; 328,000; and 212,000. This left the following in civil employment:

	Males	Females (thousands)	Total
1949 (Dec.)	14,835	7,031	21,866
1950 (Dec.)	14,934	7,166	22,100
1951 (Aug.)	15,062	7,342	22,404

Relative shifts between the main industrial groups were small. During the year ending in June 1951, agriculture lost 20,000 workers, transport and communications also 20,000, and professional, financial and other services 6,000. Manufacturing industries gained 205,000, the distributive trades 31,000, and public utilities 9,000. Other changes were small: mining and quarrying were up by 3,000, but were losing in the second half of the year; building and contracting were up by 4,000, and local government services by 7,000. Among manufacturing industries the engineering, shipbuilding and electrical group—by far the biggest—increased from 1,819,000 to 1,886,000, and the vehicle-making group, including aircraft, from 935,000 to 963,000. The textile group, the second largest, rose only from 1,009,000 to 1,025,000. The food, drink and tobacco group was up from 762,000 to 780,000, and rose further after the middle of the year. Coal-mining showed a net increase of 14,000 during the first quarter of

1951, following the concession of improved conditions; but deaths and retirements again exceeded intake of new workers in the second and third quarters, leaving only a small net gain.

The question of unemployment played some part in the British general election of Oct. 1951 but was overshadowed by other issues. The *Economist* and some other journals had been pressing for a measure of deflation, or disinflation, designed to reduce the total demand for labour to rather less than the available total of workers. The Conservatives, on taking power, put into operation a small rise in bank rate designed to discourage lending, but the *Economist* dismissed this as inadequate to make the rate effective. In view of the increased claims of rearmament it would probably require a fairly drastic deflation to produce a labour surplus. Indeed, the danger of unemployment in Great Britain seemed more likely to rise from shortages of materials for certain industries, which might cause pockets of unemployed labour to arise side by side with a general shortage.

The United Nations experts' report on *National and International Measures for Full Employment*, published at the end of 1949, was followed by a series of reports from various

UNEMPLOYMENT AS PERCENTAGE OF WORKING POPULATION

† first six months.

countries on the steps taken to maintain full employment; and the matter was also debated at the Economic and Social Council. But in view of the rising trend of employment resulting from rearmament, most countries did not regard the question as urgent. More stress was laid on the need to increase migration from countries with an excess of manpower—especially Italy—but with disappointing results. (See also BUSINESS REVIEW.) (G. D. H. C.)

Canada. The civilian labour force increased from 4,933,000 in July 1950 to 5,332,000 in July 1951, while for the same dates unemployment changed from 140,000 to 85,000. The general employment index (1939 = 100) rose to 183.4 as at July 1, 1951, as compared with 170.8 for July 1, 1950. The Canadian index value for employment in manufacturing (1939 = 100) was 177.5 in 1950 and averaged 189 for the first eight months of 1951.

United States. The civilian labour force (persons not in the armed forces and available for employment) numbered 64,208,000 in Aug. 1951, a decline of 659,000 from Aug. 1950. Unemployment also declined, the Aug. 1951 total of 1,578,000 being 922,000 less than the Aug. 1950 total.

TABLE III. NUMBER OF EMPLOYEES IN NON-AGRICULTURAL ESTABLISHMENTS, BY INDUSTRY DIVISION, UNITED STATES* (in thousands)

Industry division	Aug. 1950	June 1951	July 1951	Aug. 1951
Total est. employment	45,080	46,559	46,436	46,670
Mining	950	925	907	926
Contract construction	2,629	2,687	2,749	2,796
Manufacturing	15,450	15,950	15,829	15,970
Transportation and public utilities	4,120	4,159	4,180	4,195
Trade	9,474	9,733	9,657	9,627

Service	4,827	4,835	4,851	4,842
Government	5,793	6,377	6,356	6,400

* Proprietors, self-employed persons, domestic servants and armed forces excluded.

SOURCE: United States Bureau of Labour Statistics, *Monthly Labour Review*.

Between Aug. 1951 and Aug. 1950 every division of non-agricultural employment showed an increase with the exception of mining, in which the number of employees declined by 24,000; the largest decline within mining itself was 35,000 in bituminous coal. The greatest changes occurred in manufacturing, contract construction and trade, where the increases numbered 520,000, 167,000 and 153,000, respectively. These increases were a continuation of the 1950 trend, although the rate of increase had declined in 1951 as full employment was approached.

Most of the increase in employment in manufacturing occurred in the durable goods industries, the increase being greatest in the machinery, transportation equipment and primary metal industries. In the same period employment in the non-durable goods industries declined by 86,000. The increase in employment in some non-durable goods industries, particularly in the chemical industry, was more than offset by the drop in employment in the textile, food and leather industries.

TABLE IV. INDICES OF WORKER EMPLOYMENT AND WEEKLY PAY ROLLS IN MANUFACTURING INDUSTRIES (1939 average = 100)

Period	Employment	Weekly pay roll
1945 (average)	157.0	293.5
1946	147.8	271.7
1947	156.2	326.9
1948	155.2	351.4
1949	141.6	325.3
1950	149.7	371.7
1951	159.4 (8 mo.)	430.2 (7 mo.)

SOURCE: United States Bureau of Labour Statistics, *Monthly Labour Review*.

The employment index for manufacturing industries increased from 149.7 in 1950 to 159.4 for the first eight months of 1951. For the same industries the weekly pay roll

TABLE V. EMPLOYEES IN MANUFACTURING, BY MAJOR INDUSTRY GROUPS, UNITED STATES (in thousands)

Industry group	Aug. 1949	Aug. 1950	Aug. 1951	Net Change Aug. 1950 to Aug. 1951
All manufacturing	14,114	15,450	15,970	+520

index for the first seven months of 1951 was 430.2 as compared with the 1950 value of 371.7. The expanded rearmament programme continued to be the major factor affecting employment and wage structures.

In Jan. 1951 a national manpower mobilization policy was promulgated by the president. Following this, the Wage Stabilization board ordered a general ceiling on wage increases, later followed by a series of orders relaxing the "freeze" for various groups of wage earners. A new wage policy was formulated by the board in Aug. 1951 whereby all workers, both organized and unorganized, might receive wage adjustments related to changes in the cost of living. (See also BUSINESS REVIEW.) (P. TA.)

ENDOCRINOLOGY. The adrenal cortex was again the centre of interest in endocrinology during 1951. Research in this field during the year contributed to a better understanding of the chemical steps by which adrenal steroids are produced in the body, indicated some of the mechanisms by which the gland is stimulated to oversecretion, and partially explained the manner in which the active steroids such as cortisone and compound F (17-hydroxy-corticosterone) influence the inflammatory expressions of many diseases.

Perfusion of the isolated, surviving beef adrenal gland (O. Hechter) revealed the following facts about the biological synthesis of the adrenal hormones. The parent substance is cholesterol, which the gland can synthesize from acetic acid. Under the stimulus of ACTH (adrenocorticotrophic hormone) the adrenal cell changes cholesterol to pregnenolone. The latter steroid is then transformed through successive steps to the biological end products, which are compound F and compound B (corticosterone). Both of these steroids are active in restoring to normal the metabolism of foodstuffs and of

electrolytes in the adrenal-deficient animal. The perfused glands have a high capacity for steroid manufacture, which is in agreement with previous observations that under stress the adrenal delivers comparatively huge amounts of active steroids to the tissues.

The means by which the anterior pituitary gland is signalled to increase its output of ACTH during stress had not been completely elucidated. The work of the year made it appear likely that more than one type of signal is used (G. Sayers). There seemed no doubt that whenever the circulating level of adrenal cortical hormones falls ACTH is liberated and by its action on the adrenal serves to bring back the level to a normal value. This type of homeostatic mechanism accounts for many of the adjustments observed, but not for all. Evidence had accumulated to show that adrenaline can evoke ACTH secretion by a direct effect on the pituitary gland and that stimulation of the central nervous system (even in the absence of the adrenal medulla) leads to increased adrenal cortical secretion.

During the past few years the great number of experimental and clinical studies dealing with the effects of ACTH and cortisone upon inflammatory phenomena under various conditions inevitably led to some initial confusion and contradiction in interpretation. However, during 1951, a large number of observations were correlated and it became possible to establish a more unified concept of the mode of action of these hormones. The anti-inflammatory effect seems to be non-specific; *i.e.*, equally exerted whether the inflammatory agent be a living bacterium, a non-living protein antibody or a simple chemical irritant. The tissue elements which are acted upon are the small blood vessels (capillaries, arterioles and venules), the fibroblast cells and the materials produced by them (ground substance and fibres). The C₁₁-oxysteroids, *e.g.*, cortisone, modify the response of the small blood vessels to drugs and prevent damage to the endothelial cells lining such blood vessels. The proliferation of fibroblasts which follows tissue irritation is sharply reduced, as is also the outgrowth of new capillaries. These actions were shown to be exerted locally upon the lesion and not through the mediation of a special organ or of some general bodily response. Most workers in the field agreed that cortisone does not interfere with the formation of antibodies or with their fixation to a sensitized group of cells. It does inhibit the usual inflammatory reaction of the connective tissue elements to the fixed antibody.

Anterior Pituitary. Diabetes insipidus is a disorder of water excretion caused by a deficiency of antidiuretic hormone (A.D.H.), secreted by the posterior pituitary gland. The kidney becomes unable to hold back water efficiently, and the result is a urinary volume which may reach 15-20 litres per day. It had been known for many years that an activity of the anterior pituitary was also involved in this disorder, because damage to both parts of the pituitary gland did not result in diabetes insipidus. During 1951 it was shown that the growth hormone or a factor associated with it acts in an opposite fashion to A.D.H. It promotes the excretion of water. It became evident that the regulation of body water is complex and that at least three hormonal factors are involved: A.D.H., growth hormone and the adrenal cortical steroids.

Thyroid. Many years before the observation had been made that the cells of a small area of the mid-brain seemed to concentrate iodine. No explanation for this phenomenon was forthcoming. During 1951 D. E. Clark and his co-workers studied the problem with the use of isotopic iodine (¹³¹I). They found that there was no particular concentrating capacity for inorganic iodine in any part of the brain. However, thyroxine (possessing isotopic iodine) accumulated in certain areas of the mid-brain. This work served to stimulate interest in two aspects of thyroid physiology: the well-known

effects of thyroxine on the autonomic aspects of brain function, and the equally well-established effects of central nervous stimulation on the rate of thyroid function. It began to appear that both of these aspects might have their seat of action in the mid-brain. (RA. L.; S. So.)

ENGLISH LITERATURE. In English writing in 1951, intelligence, industry and ability were applied in good measure, but that extra *élan* needed to lift the writer's prose above the level of mediocrity was too seldom evident. The predicaments of the times were much in writers' minds. E. M. Forster's occasional pieces had long stimulated a desire for a new large-scale work from his pen. This, alas, did not seem to be forthcoming, but some consolation was to be derived from *Two Cheers for Democracy*, a stimulating collection of essays, lectures and broadcasts on political and aesthetic themes. So far as the political writings were concerned the conclusion suggested was that "though we cannot expect to love one another, we must learn to put up with one another"; the papers on the arts were informed, cogent and persuasive, and the whole volume reflected an alive, creative intellect.

While E. M. Forster advocated tolerance, Bertrand Russell, in his *New Hopes for a Changing World*, made a plea for courage to overcome and discard obsolete fears and hatreds which had involved man in conflicts with Nature, with other men and with himself, and which had brought oppressive gloom instead of the happiness that modern knowledge and skill rendered possible.

From the time of *The Great Illusion* (1910) onwards Sir Norman Angell had campaigned for sane political thinking, and this appeal to reason was reiterated in his autobiography, *After All*, which gave, too, a full account of the vicissitudes of a life spent largely in the cause of peace and service of others. The dangers which Charles Morgan believed threatened the mind and spirit of man were examined in *Liberties of the Mind*, a collection of essays designed to assist recognition of the attack upon those mental and spiritual freedoms which are "the breath of reason and faith"; while *The Estate of Man*, the last work of Michael Roberts, poet, philosopher and teacher, was an inquiry into "the limits of man's capacity to adapt himself to the conditions which he had helped to create."

Something of Stephen Spender's efforts to adapt himself to his times, his private and public life, and his political preoccupations and personal friendships were described in *World Within World*; and the second part of Freya Stark's autobiography, *Beyond Euphrates*, concerned with the years 1928-33, illuminated the author's thoughts and beliefs, as well as her life in Baghdad and travels in Persia and other lands.

A group of royal portraits ranged from the Duke of Windsor's memoirs, *A King's Story*, and the late Lord Sysonby's impressions of court life with Queen Victoria, King Edward VII and King George V, *Recollections of Three Reigns*, to Miss Dorothy Margaret Stuart's study of Princess Charlotte of Wales and her family, *Daughter of England*, and Professor A. Aspinall's edition of the unpublished correspondence of Mrs. Jordan and the Duke of Clarence, later King William IV—*Mrs. Jordan and Her Family*.

Steven Runciman, having declared his belief that the supreme duty of the historian was "to attempt to record in one sweeping sequence the greater events and movements that have swayed the destinies of men," presented, in the opening volume of *A History of the Crusades*, a political and military narrative of the first crusade. Austin Lane Poole's *From Domesday Book to Magna Carta*, a scholarly volume in the "Oxford History of England," concentrated on documentation and facts, and if in so doing it sacrificed, to some extent, the interest of the general reader, it was a valuable contribution to the study of one of the most remarkable passages in English history. David Mathew's *The Age of Charles I* surveyed the social life of the period; B. H. G. Wormald's *Clarendon* reassessed the great 17th-century statesman's career and offered some conclusions about his beliefs and policies before the Restoration; and Professor Andrew Browning completed a definitive life and letters of *Thomas Osborne, Earl of Danby and Duke of Leeds*, who helped to bring about Clarendon's fall.

The changes brought about in Great Britain's international position between 1830 and 1841 were surveyed in Sir Charles Webster's two volumes on *The Foreign Policy of Palmerston* and rewarding studies of more recent statesmen and politicians included the fourth volume of *The Life of Joseph Chamberlain* (1901-03), written by Julian Amery, who undertook completion of the task after the death of J. L. Garvin; Thomas Jones's satisfying "interim, unofficial" portrait, *Lloyd George*, based on his own intimate acquaintance with affairs and with the former prime minister; *The Life of George Lansbury*, by Raymond Postgate, who sometimes allowed his own political philosophy to get between his subject and the reader; and *The Last of the Radicals*, Miss C. V. Wedgwood's biography of her uncle, that staunch individualist Josiah Wedgwood.

While Winston Churchill was continuing his story of World War II—the fourth volume, *The Hinge of Fate*, was devoted to Jan. 1942-June 1943, when, for the first six months "all went ill; for the last six months everything went well"—biographies of two kindred spirits, fighting admirals of World War I, whose talents Churchill recognized when first lord of the Admiralty, were being completed. *The Life and Letters of David, Earl Beatty* was authoritatively written by Rear-Admiral W. S. Chalmers; the career of Roger Keyes was ably and affectionately recorded by General Aspinall-Oglander in *Roger Keyes*.

Roy Harrod offered a well-proportioned *Life of John Maynard Keynes*, which did not neglect Keynes's interests outside economics. Noel Annan's book, *Leslie Stephen*, on the man of letters, mountaineer, editor of the *Dictionary of National Biography* and father of Virginia Woolf, was largely concerned, with Stephen's thought and character, his participation in the main intellectual movements of his

time and the contribution he made to Victorian ethics. A study of the Victorian theatre and the relationship then existing between stage and society formed part of Laurence Irving's comprehensive life of his famous grandfather, *Sir Henry Irving: the Actor and his World*.

William Cowper, John Clare, S. T. Coleridge, James Thomson, Jefferson Hogg, William Hayley and Wilkie Collins were among the familiar literary figures of the past reassessed and re-examined and, if the re-siftings of evidence yielded little to revolutionize accepted judgments, they at least contributed something towards fuller understanding of the writers' lives and backgrounds. Two important works on literary and linguistic criticism respectively were J. W. H. Atkins's *English Literary Criticism: the 17th and 18th Centuries* and William Empson's brilliant *The Structure of Complex Words*, which was a worthy successor to his *Seven Types of Ambiguity* (1947).

Lastly, there was Mr. and Mrs. Peter Opie's fascinating and scholarly *Oxford Dictionary of Nursery Rhymes*, which brought together more than 500 traditional rhymes and songs, and offered some interesting theories about their origins and functions. (A. Ck.)

Fiction. During 1951, most of the leading novelists produced work of some kind, if not, in some cases, their best. Foremost among them was I. Compton-Burnett whose characters in her new novel *Darkness and Day*, from rebellious boot-boy to tragi-pathetic children, were ruthlessly and super-humanly articulate as ever and haunted, as in all her books, by the menacing but always mentionable sins of the fathers. The mood of the book seemed mellower than in Miss Compton-Burnett's earlier novels but the reader still felt the impact of a wise and cultured mind, and the wit was keen and sure.

Graham Greene's preoccupation with sin and sex was dispiriting, if cathartic, in *The End of the Affair*; physical passion was brilliantly conveyed in a guilt-ridden tale of adultery that ended with minor miracles. It could be objected that the submergence of personality through lust, though convincing, made of its hero something less than a man. (The same was true of Julia Strachey's pretentious novel *The Man on the Pier*.) Greene's description of Roman Catholicism as an infection had doubtless, in a Protestant country, provocative appeal.

The Masters by C. P. Snow was an erudite and tense tale of college politics and Machiavellian dons, although Snow's avowed aim to follow his hero through the differing strata of English life was perhaps more sociological than literary. Beside Robert Liddell—with whom he invited comparison—he seemed somewhat humourless; a lightweight novelist. A sense of culture informed every page of Charles Morgan's *A Breeze of Morning*, a tale of subtly differentiated shades of love and longing told urbanely, at times poetically, against the background of a classical education. Through it ran the flashing stream of Morgan's immaculate prose. In the same tradition was Anthony Powell's slight but civilized autobiographical novel *A Question of Upbringing*. In *A Way through the Wood*, Nigel Balchin's treatment of the theme of adultery was somewhat similar to Graham Greene's, with, characteristically, more stress on psychology than religion. He communicated with understanding the feelings of an analytically minded husband for the irresponsible and faithless wife he still loved. William Sansom, in *The Face of Innocence*, gave, less convincingly, the case history of a tiresome female psychopath. Francis King's *The Dividing Stream* saw the return of the unspoilt child of nature. *My Fellow Devils*, a new work by L. P. Hartley, and V. S. Pritchett's *Mr. Beluncle* were published towards the end of the year.

Among historical novels, Lord Belhaven's *The Eagle and the Sun*, an inspiring account of the march of the Tenth

Legion into Arabia in the time of Augustus, was well-documented and written in soldierly, if sometimes over-disciplined prose. John Cowper Powys' *Porius* was a vast, shrouded chronicle of the time of King Arthur. It was strenuous work to follow Powys through his shadowy, glamorous world of magic and legend. Of the semi-documentary novels of contemporary history, Robert Harling's *The Paper Palace* and, in the thriller class, Eric Ambler's *Judgement on Deltchev* were outstanding. Ambler brilliantly evoked the atmosphere of subterfuge and tortuous plot and counterplot in a régime behind the iron curtain. Harling dealt with the shady chapter in a press baron's success story. It was an accomplished first novel, slick and journalistic, yet illuminating the social scene. Of the war novels, the greatest demand was for Nicholas Monsarrat's *The Cruel Sea*, which became a best-seller on both sides of the Atlantic. Robin Maugham showed signs of family talent in *The Rough and the Smooth*, a well-planned if somewhat uneven story of a tawdry *femme fatale*. Anthony West, in *Another Kind*, proved himself to be a more mature and sophisticated writer, but this, his second novel, was over-ambitious. The first part, which dealt with the infatuation of a mediocre architect for a superior harlot, was at times impressive. His idea of civil war in Great Britain was less convincing and the two strands of his novel failed to cohere.

In 1951, few collections of short stories called for special comment. The most noted event was probably the publication, in three volumes, of W. Somerset Maugham's collected tales. H. E. Bates's stories in *Colonel Julian* seemed at times mechanical. Compassion for the underdog was vitiated, in some of them, by a stultifying bitterness. Noel Coward's *contes* in *Star Quality* were typical—rather dated, a little like nostalgic gramophone records. The theme throughout Denton Welch's posthumous *A Last Sheaf* was the plight of the sensitive, even soft, individual in a hard world. In novels and short stories alike there was less satire than in the previous year. Preoccupation with sex could be seen as an escape through the senses from a world that was viewed, sometimes with perplexity, sometimes with compassion, often with despair. Apathy rather than Stoicism set the literary mood. Heroes were notably unheroic. Helen, not Penelope, was the Woman of the Year. (L. PA.)

Poetry. The year 1951 was not outstanding in English poetry. The Arts Council of Great Britain instituted a poetry competition for narrative and lyric poems, to be judged by a panel of university dons and, perhaps for this reason, few established poets competed. The winning entries did not discover any remarkable new young talent, unless it was that of Robert Conquest, one of the lyric winners. These poems were published by Penguin Books.

In general the publication of poetry became even more difficult, owing to rising costs, but several small productions on the lines of the old broadsheets gave new hope to young poets seeking a hearing. In particular, the Hand and Flower Press and the Latin Press produced works of taste and promise by poets whose names were unfamiliar to the public; e.g., Thomas Caddick and Guido Morris.

Of the older, established, poets, Walter de la Mare published a long poem, *Winged Chariot*, on the subject of time, full of the felicities of his unique talent; Robert Graves, in his *Poems and Satires 1951*, did not add greatly to his reputation. Perhaps the most remarkable publication of the year was *The Collected Poems of Keith Douglas*, a young writer of very great promise killed in Normandy in 1945. The *Selected Poems* of the American poet Richard Eberhart gave English readers a new insight into one of the most original poets writing, and the *Collected Poems* of Marianne Moore emphasized the preciosity of much that had been labelled "modern" in the previous 25 years. *Poems 1938-49*

introduced to English readers another young American poet of promise, Robert Lowell. *The Poems of C. P. Cavafy*, the Greek poet, translated by John Mavrogordato, were compared with those of W. B. Yeats as being some of the most beautiful of the 20th century had produced.

Among books by women writers, *One is One*, a new collection by Mrs. P. D. Cummins, was a book noteworthy for its expression of the pain and grief of existence. In *The Golden Bird*, Anne Ridler forsook her domestic variations for fairy-tale, not entirely unsuccessfully. In her heroic poem, *Gods with Stainless Ears*, Lynette Roberts produced a work of eccentric brilliance.

The activities of those bodies concerned with presenting poetry to the public orally were continued. The British Broadcasting corporation produced a new translation, by C. Day Lewis, of Virgil's *Aeneid*. Many lesser readings were given by the P.E.N., the National Book League, and the Apollo society. The British Council, in collaboration with the Gramophone company, continued to present its issues of recorded classics. (P. DN.)

ENGRAVING: see DRAWING AND ENGRAVING.

ENTOMOLOGY. The Ninth International Congress of Entomology was held in Amsterdam during Aug. 17-24, 1951, and was attended by over 700 entomologists from 38 countries. Nearly 300 papers were read at the meetings of the 14 sub-sections. Two topics of special interest to the host country—the role of entomology in temperate and tropical agriculture—attracted many experts in these fields.

The Insect Egg-Shell. Insect eggs are small and would rapidly dry up unless adequately "waterproofed." This is one function of the egg-shell. A second is the mechanical support of the embryo. But those properties which confer rigidity and impermeability also render the shell impermeable to oxygen. Although the microscopist Karl Leuckart in the last century described certain minute channels in the egg-shell, little was previously known of their function and anatomical complexity. By employing a new method for injecting the air spaces with a black precipitate of cobalt sulphide, V. B. Wigglesworth and J. W. L. Beament were able for the first time to trace their distribution accurately. Leuckart's canals were shown to have a respiratory function, permitting oxygen to diffuse into the embryo. An unexpected discovery was that the canals did not contain a continuous air column, but instead were filled with a spongy air-filled protein matrix; further, they communicated internally with an air-filled protein layer which, forming part of the shell, entirely enveloped the embryo. Although Leuckart's canals are usually sited at one pole of the egg, the oxygen diffusing through this porous "pneumatic" layer is sufficient to supply the requirements of the posterior regions of the embryo.

Researches on the structure and physical properties of the egg-shell have more than an academic interest. In combating orchard pests the aim is often to control the insect in the egg stage. It is now known that the shell material of many eggs is virtually impermeable to all ovicidal substances. In order to reach the living oöcyte the ovicide must penetrate Leuckart's canals and the pneumatic layer and also pass through the inner wax layer which waterproofs the egg.

J. J. Matthée's description of the egg of the South African brown locust, *Locustana pardalina*, was also an interesting contribution in this field in 1951. In the eggs of this insect, the absorption of water is a necessary preliminary to development. The evaporation or uptake of water can only occur through a specialized area of the chorion, the hydropyle. The deposition of a protein-like substance over the hydropyle surface plays an important role in preventing evaporation

in dry atmospheres while offering no resistance to absorption if water is present in a liquid state.

Matthée's observations on the water relations of the egg explained a puzzling feature of the ecology of this locust, namely the sudden appearance of hopper bands in localities where swarming adults had been absent for years. Eggs laid in the very dry soil of the natural habitat (the Karoo) probably survive by absorbing a little moisture during light rain showers. However, the full complement of water needed for development and hatching only becomes available after the rare periods of heavy rainfall.

Other Adaptations to Arid Environments. H. E. Hinton (Bristol) described a most unusual adaptation. Although most insects are protected against rapid evaporation by a waxy waterproofing layer at the surface of the cuticle, they are normally unable to survive excessive loss of water. The larva of the chironomid *Polypedilum vanderplanki* is exceptional and can tolerate almost complete dehydration for over 18 months. The insect has been found in small unshaded pools on granite rock masses in Nigeria. As the pools dry up completely from time to time, the free-swimming larvae are repeatedly subjected to severe desiccation and to high temperatures. It is interesting that the larvae, when brittle and desiccated, can withstand much higher temperatures (68°C.) than the active larvae (42°C.).

A further example of tolerance of extreme dehydration was given by K. R. Norris who worked on the biology of the red-legged earth mite, *Halotydeus destructor*, an important pasture pest in Western Australia. The "aestivating" eggs of this mite are usually retained in the dead body of the female, and can survive soil temperatures of 60°C. or more, sometimes remaining viable for over four years. When moistened by winter rains water is absorbed and hatching occurs. But the eggs fail to hatch unless the temperature is sufficiently low—a probable safeguard against premature hatching during occasional heavy summer rains.

The Ecology of Salt-Marsh Beetles. Several species of the staphylinid genus *Bledius* occur along the Jutland coast, where the insects may be found tunnelling in sandy soil between or above the tidemarks. Among the many aspects of their biology studied by Ellinor Bro Larsen (Copenhagen) may be mentioned their adaptations to the high salt content of the environment and their sub-social behaviour. The beetles feed on algae. Although some species avoid too high a concentration of salt in their diet by collecting the algae after rain, one species, *B. Spectrabilis*, cannot do so as its burrows are covered daily by the tide. However, the insect is physiologically adapted to this situation and is able to maintain the normal osmotic pressure of the blood by withdrawing water from the gut against a steep concentration gradient. Although in this respect a salt-laden medium is apparently unfavourable, *Bledius* chooses it in preference to a fresh one. In nature, this choice may possibly confer some degree of protection against parasitic wasps and fungi. The galleries of *Bledius* are partially ventilated by the tide movements. But the egg-chambers, which require extra oxygenation, are kept ventilated by the digging activities of the females—an interesting example of maternal care.

Host Plant Selection by Aphids. The selection of hosts by phytophagous insects was often thought to be dictated by their botanical affinities. This argument was based on the assumption that the significant "token" substances in the plant, perceived by the insect's sense of taste or smell, are more likely to occur in allied than in unrelated species. When applied to the aphids, however, this line of reasoning broke down, for in those species with alternate hosts, the winter and summer hosts are always quite unrelated botanically. Investigations of the black bean aphid, *Aphis fabae*, by J. S. Kennedy showed that a second factor, the physio-

logical leaf age, was of great importance. On both the primary host, the spindle tree *Euonymus*, and on a secondary herbaceous host, such as sugar beet, aphids were found to prefer growing or senescing leaves to mature leaves. The summer migration to secondary hosts may indeed be provoked by the maturity of the spindle foliage which is unattractive in comparison with the complete range of leaf conditions to be found at this time on the secondary host. Under other conditions, however, token stimuli unconnected with the nutritional requirements of the insect may play a leading role in host selection. This "dual discrimination" theory, proposed by Kennedy, suggested that selection depends on the interplay of these two classes of stimuli.

A Rare Australian Aphid. E. O. Essig of Berkeley, California, published a short account of *Anomalaphis comperei*, which had again been found at the original locality of Albany, Western Australia. It was last collected in 1904. The aphid, which has many peculiar features, is interesting as being the only endemic species of Australian aphid. Its nearest ally was considered to be a newly discovered Chinese species taken from the "living fossil" *Metasequoia*.

Insect Fauna of Northern Europe and the Pleistocene Glaciation. Geological evidence has often been used in tracing the probable effects of past climatic changes on insect distribution. In contrast, studies by C. H. Lindroth of Djursholm, Sweden, on the distribution of ground beetles (*Carabidae*) led to some revision in the geological interpretation of the extent of the Pleistocene glaciation in Scandinavia. Certain carabid species, for example *Bembidion grapei*, exhibit a striking wing dimorphism, the short-winged character being a simple Mendelian dominant. In expanding populations of these insects the homozygous long-winged beetles spread in front of the short-winged forms. By mapping their distribution Lindroth was able to show (in agreement with the botanical evidence) that Scandinavia was not uniformly glaciated, as was once supposed, but contained warmer "refuges" on the Norwegian coastline from where the surviving relict populations radiated in post-Pleistocene times.

Insect Polyhedral Diseases. The researches of E. A. Steinhilber and his co-workers at Berkeley, California, demonstrated the possibilities of utilizing a naturally occurring virus disease as a practical means of controlling an insect pest—in this case the alfalfa caterpillar *Colias philodice*. The polyhedral bodies were extracted from diseased caterpillars and after suitable dilution were used as a spray material. Under natural conditions these "wilt" diseases often affect the insect too late in larval life to prevent damage to the crop. In field tests it was found possible both to infect young larvae and to initiate an epidemic in the population.

The nature of the polyhedral bodies, which in Lepidoptera develop in the cell nuclei of infected tissues, has not been fully understood. G. Bergold demonstrated in Canada that, although the polyhedra were not the virus, the latter could nevertheless be released from the polyhedra by suitable chemical treatment. New facts concerning their form and structure were also revealed by electron microscopy, an example being the paper by K. M. Smith and R. W. G. Wyckoff (see below).

ENVOYS: see AMBASSADORS AND ENVOYS.

EPIDEMICS. Reports received by the World Health organization indicated that, in 1951, epidemics of plague were confined to southeast Asia, although a few cases were reported elsewhere. Central India was the chief sufferer but the incidence was not as heavy as in 1950. A small outbreak of 150 cases was reported from the Yemen in July, shortly before the annual pilgrimage to Mecca was due to start. Fortunately the outbreak did not spread to any place in Saudi Arabia near the pilgrims' route to the holy places and the pilgrimage was declared free from epidemic disease.

Cholera in epidemic form was present in Burma at the beginning of 1951 and continued throughout the year, declining gradually. The maximum number of cases in a week was 176. India suffered severely, particularly central India and West Bengal. In the latter, the port of Calcutta reached a peak in May with 337 cases and 111 deaths in one week. In Madras state, at the beginning of the year, over 2,000 cases were occurring weekly. By mid-March the incidence fell to about 1,000 a week, and then for some months to about 700 a week, diminishing towards the end of the year. A similar trend occurred in the other affected areas.

Smallpox was reported continuously throughout the tropical and subtropical countries of Africa and Asia. An epidemic was present in India at the beginning of the year affecting, in particular, the states of Madras, Madhya Pradesh, Bihar and West Bengal. The neighbouring Pakistan province of East Bengal was also severely affected. In the port of Calcutta the incidence reached a peak of 680 cases a week in mid-March, but within four months this had declined to less than ten cases a week. The port of Bombay was also affected but less severely. The presence of smallpox in busy ports was of great epidemiological importance since, owing to the 14-day incubation period of the disease, infected travellers might reach distant countries before showing any signs of smallpox. By air they might reach almost any part of the world. In Africa the main outbreaks were in Nigeria, French West Africa and the Belgian Congo.

Yellow fever gave rise to no epidemics of non-jungle type. Most of the sporadic cases reported were from the Gold Coast. There was, however, a serious outbreak of jungle yellow fever, which started late in 1950 in the inaccessible part of the state of Goiaz in Brazil and was brought under control in 1951 with the aid of mass immunization. There were 2,000 cases reported with an estimated 400 deaths. Small outbreaks of jungle yellow fever were reported from Ecuador, Costa Rica, and Panama.

No major epidemic of typhus occurred during 1950. Afghanistan, Ethiopia and Ecuador had small epidemics and minor outbreaks were reported from Yugoslavia and Portugal. Louse-borne typhus became much easier to control since new and efficient residual insecticides such as D.D.T. were readily available and easy to use.

Cerebro-spinal meningitis as a serious epidemic disease had, of recent years, chiefly affected Africa. In late 1950 the disease appeared in the west of the Anglo-Egyptian Sudan and in 1951 it spread across the northern half of the country, causing over 51,000 cases with 7,000 deaths. Modern methods of treatment with sulpha drugs and antibiotics greatly reduced the mortality rate for this disease but poor communications in Africa resulted in delayed treatment and raised the mortality rate in many areas.

An epidemic of influenza began in Scandinavia towards the end of 1950 and spread to many other countries in Europe early in 1951. A very sharp outbreak occurred in the United Kingdom, which reached a peak at the end of January and ended a month later. The disease was also reported in Canada and the United States with moderate outbreaks.

The World Influenza centre of W.H.O. was set up in London and certain influenza centres of other countries were engaged on the work of indentifying the causal virus or viruses from throat washings.

Early in the year measles was more prevalent than usual in most countries of Europe and in the United States. In most countries the incidence was higher than in any year since 1942. (See also BACTERIOLOGY.) (H. M. E.)

ERITREA. Former Italian colony on the Red sea bounded S. by Ethiopia and W. by Sudan, under temporary British administration from 1941. Area: 48,350 sq.mi. Pop. (1950 est.): 1,100,300 (incl. 18,000 Italians). Language: mainly Tigrinya and Tigré. Religion: c. 50% Christian (Coptic) and 50% Moslem. Capital, Asmara (pop. c. 117,000). British chief administrator, D. C. Cumming.

History. On Dec. 2, 1950, the U.N. general assembly passed a resolution providing for the federation of Eritrea with Ethiopia before Sept. 15, 1952. Eritrea was to be granted autonomy in domestic matters and the powers to be vested in the federal government were specified. The solution was accepted by all the states concerned. Whilst it did not satisfy the demands of the two major and opposing political factions in Eritrea, one of which, mainly Christian, wanted full union with Ethiopia, and the other of which, mainly Moslem, demanded full independence, it was well received locally. At a public meeting in Asmara all political parties agreed to accept the decision and to co-operate in making it effective. The United Nations commissioner, E. Anze Matienzo (Bolivia), reached Asmara in February, and both he and the British administration were preparing in their separate spheres the measures necessary for federation. These included framing a constitution for consideration by a representative assembly and forming an administration composed of Eritreans. No important visible results had appeared by the end of 1951, but many Eritreans had been brought into the administration to replace foreigners. The commissioner left for the U.N. general assembly in Paris in November. Although the political parties maintained their acceptance of the federal solution, their activities were directed towards shaping it to meet their respective original aims. The constitution on which this battle would be fought was still being drafted when the year ended.

For the first half of 1951 the state of public security in Eritrea gave cause for alarm. Numerous gangs of *shifita* (bandits) roamed the land and committed outrages and acts of lawlessness. All traffic by road and rail had to be controlled and restricted. The efforts of the forces of law and order were frustrated by the difficult terrain and by the unwillingness of the inhabitants to support them. It seemed likely that this state of insecurity would hamper the carrying out of federation. A new approach was inevitable and in June a general amnesty was proclaimed for all *shifita*, whatever their crimes; a proclamation giving the chief administrator stronger and more summary powers to combat lawlessness was enacted. These measures were successful. Some 1,300 *shifita*, including practically all the known leaders, surrendered and returned to a more settled life. The new security measures were vigorously applied and the inhabitants showed co-operation in enforcing them against subsequent offenders. The Ethiopian government gave full co-operation in frontier control to prevent "border-hopping" and brigandage was reduced to negligible proportions.

An agreement between the Ethiopian and Italian governments to resume diplomatic relations cleared the air and was well received. (F. E. S.)

Economy and Finance. Budget (July 1, 1949-March 31, 1950, actual) balanced by contribution from Great Britain as administering power at £2,950,597. Foreign trade (1950, recorded value): imports £4,089,620; exports £2,919,792. Roads (1950, maintained): 780 mi. Railways (1950): 193 mi. Ships entered at Massawa (1950): 773,828 N.R.T.

ESTONIA. From Feb. 24, 1918, to Aug. 6, 1940, when it was annexed by the U.S.S.R., Estonia, one of the Baltic states of northeastern Europe, was an independent republic. Area: 18,357 sq.mi. Pop.: (1939 est.) 1,134,000; (1950 est.) 1,200,000, but according to reliable estimates the purely Estonian population declined from 998,000 (88%) to 684,000 (57%) between 1940 and 1950. Language: Estonian and Russian. Religion: Lutheran and Greek-Orthodox. Chief towns (pop., 1939 est.): Tallinn (cap., 146,400), Tartu (60,100), Kohtla-Järve (1950 est., 30,000). Chairman of the presidium of the Supreme Soviet of the Estonian S.S.R., August M. Jakobson; chairman of the council of ministers, Arnold T. Veimer and (from March 29, 1951) Aleksey Müürisepp.

History. On Feb. 25 the citizens of Estonia elected a new Supreme Soviet. The country was divided into 115 constituencies having each an average of 10,000 inhabitants. Out of a possible poll of 814,682 votes the total cast was 813,777 (99.89%) and only 1,118 (0.14%) votes were said to have been recorded against the official candidates. At the previous election, in 1947, there were 804,172 electors and 28,003 (3.5%) opposition votes. Only 57 of the 115 members of the new Supreme Soviet were Estonians; 31 were Russians of Estonian extraction, 26 Russians and one was Georgian (Joseph Stalin). In seven constituencies for members of the armed forces there were elected Admiral N. M. Kharlamov, deputy chief of staff of the Soviet navy and Major General L. I. Vaghin, in command of Soviet land forces stationed in Estonia, which was included in the Leningrad military area. It became known during the year that the principal Soviet naval base in the Baltic had been transferred from Leningrad to Tallinn.

On March 29 the Supreme Soviet relieved of his duties the premier, A. T. Veimer, the only remaining native-born Estonian Communist in the government. His dismissal, however, apparently involved no disgrace, for on March 13 he was awarded the Order of Lenin; he was also elected member of the new presidium of the Supreme Soviet. Previously unknown in Estonia, Veimer's successor, A. Müürisepp, was first heard of in 1949 on his appointment as deputy prime minister. The annexation of Estonia by the Soviet Union was followed by unprecedented expansion of bureaucracy. From 9, the number of ministers had risen by 1951 to 28, of whom 22 were either Russians or Russified Estonians. Of 49 deputy ministers 19 were Russians. Of 146 managers of industrial undertakings 71 were Russians.

The 6th congress of the Estonian Communist party was held at Tallinn, April 11-14. Ivan Käbin, first secretary of the central committee, remarked that while on the date of the previous congress (Dec. 1948) only 4.6% of all farms was collectivized, at the beginning of 1951 the proportion was over 90%. The debates centred mainly on the damage the "bourgeois nationalists" had done to the country; many speakers emphasized that the liquidation of their hard core in 1950 had not broken their influence.

Jaan Kivit, pastor of Viru-Jaagupi, was appointed archbishop of the Estonian Lutheran Church. In the summer the church synod met in Tallinn to support a "peace appeal" by the Georgian and Armenian patriarchs of the U.S.S.R. Roman Tang was appointed metropolitan of the Greek Orthodox Church of Estonia.

The Estonian National council, a central organization of Estonians in the western world, presided over by August Rei, the last foreign minister of independent Estonia, held its 3rd congress in Stockholm, Sweden, on April 29. Oliver A. Peterson, attaché to the U.S. embassy, addressed the congress and said that the struggle of the Estonians in exile had the sympathies of the American people. On June 3 the Voice of America added to its programme broadcasts in Estonian.

Education. V. K. Oja, an Estonian deputy to the Soviet of Nationalities said in Moscow on March 9, 1951, that there were 20% more pupils in primary and secondary schools than before 1940, four and a half times more in the technical schools and twice as many in institutions of higher education.

Industry. In 1951 oil shale production was estimated at more than 3 million tons, as compared with 1.7 million tons in 1939. The postwar 5-yr. plan, however, had asked for 8 million tons.

Finance. Budget estimates (million roubles, 1950; 1951 in brackets): revenue 1,039.2 (1,104.5), expenditure 1,019.6 (1,094.5). (K. Sm.)

ETCHING: see DRAWING AND ENGRAVING.

ETHIOPIA. Independent empire of northeastern Africa bounded N. by Italian Eritrea (from 1941 under British military administration), W. by the Anglo-Egyptian Sudan, S. by Kenya, S.E. by Italian Somaliland and E. by British and French Somaliland. Area: c. 350,000 sq.mi. Pop. (no census ever taken, 1949 est.): 16,700,000.* Language: Amharic, the official language; also Tigrinya, Tigré, Galla, Somali, etc. Religion: Christian (Alexandrine) 57%; Moslem 17%; pagan, etc., 26%. Chief towns: Addis Ababa (cap., c. 250,000); Harar (c. 45,000); Dessie (c. 35,000); Dire-Dawa (c. 30,000). Ruler, Emperor Haile Selassie I; prime minister, Bitwaddad Makonnen Endalkachaw.

History. The preparations for the incorporation of Eritrea by Sept. 15, 1952, into Ethiopia under the terms of the decision reached by the U.N. general assembly on Dec. 2, 1950, were well advanced. E. Anze Matienzo (Bolivia), the U.N. commissioner, who established his offices at Asmara early in 1951, was at the end of the year in Geneva drafting the terms of the constitution which he would recommend to the constituent assembly of Eritrea.

The settlement of the future of Eritrea cleared the way for the resumption of diplomatic relations with Italy; and an agreement for this purpose was reached following the visit of the Italian under secretary of state, Giuseppe Brusasca, early in September, thus putting an end, to quote the emperor's speech from the throne at his coronation anniversary on Nov. 3, to long-standing hostility.

During the year direct relations were instituted with Yugoslavia, Spain accredited its Cairo minister to Addis Ababa and Ethiopian ministers took up residence in Brazil, Venezuela and Mexico. The diplomatic representatives to and from Great Britain were raised to the status of ambassadors.

The emperor's adherence to the principles underlying the United Nations was evidenced in practical fashion by the sending of an Ethiopian infantry battalion of 1,158 officers and men to fight in Korea. The battalion, under Colonel Kebede Guebre, arrived at Pusan on May 6 and was in action in August.

The administration of the service of the loans granted by the International Bank for Reconstruction and Development in 1950—U.S.\$7.5 million for road construction and maintenance, U.S.\$3 million for the new Development Bank of Ethiopia, and U.S.\$1.5 million for telecommunications—was organized. An Imperial Highways authority was constituted, and work began on the trunk road connecting the capital with the port of Assab and on the important

* The official Ethiopian estimate given by the *Demographic Yearbook 1949-50* of the United Nations appears high in the light of information from other sources. The Italian estimate on Jan. 1, 1940, for the so-called Italian East Africa (Ethiopia, Eritrea and Italian Somaliland) was 11,216,000 which would bring the population of Ethiopia to some 9,450,000.

Emperor Haile Selassie (left) inspecting Ethiopian troops bound for service with the United Nations in Korea.

road linking the rich province of Sidamo in the south with the railway. An Imperial Telecommunications authority was charged with the responsibility of re-conditioning the existing land lines, installing, where suitable, wireless telephones and creating telephone links with the outside world. The Development bank was in being under the direction of Leon Józef Barański, formerly a director of the Bank of Poland, who, with the assistance of an expert staff of industrial and agricultural engineers and a legal adviser, was feeling his way cautiously amongst the many problems that confronted him.

Early in 1951 the government decided to hold an Agricultural, Industrial and Commercial exhibition, which took place from Nov. 17 to Dec. 2. Livestock and farm produce were collected from all over the country and were judged, and prizes were given. Government-imported cattle were on show and there were suitable agricultural and animal husbandry demonstrations. Local industries were exhibited; and a wide range of imported foods displayed. There was in fact ample evidence of the increased interest taken all over the country in the improvement of agriculture and cattle-raising; and of the higher standard of living which was reached at least in the capital and principal towns. Some 250,000 people passed through the turnstiles.

The Ethiopian year 1943 (Sept. 11, 1950-Sept. 10, 1951) was good for trade. Compared with the preceding year exports of coffee passed from 21,152 to 27,503 metric tons (in value from Eth.\$ 32.5 million to 56.5 million) and exports of hides from 6,576 to 10,857 tons (in value from Eth.\$ 6.8 million to 20.1 million). Although imports increased too, there was a surplus of Eth.\$ 16.4 million.

On July 26, a special tribunal in Addis Ababa sentenced eight men, including Bitwadded Negash, a former president of the parliament, to death for plotting to assassinate the emperor and set up a republican régime. Ras Hailu, who in 1917 led a revolt against Haile Selassie, died in Addis Ababa on May 15, aged about 99.

Bishop Basilius, elected archbishop and primate of Ethiopia by the All-Ethiopian synod on Jan. 8, was the first Ethiopian monk to hold this office. Until then, traditionally, the chief bishop (abuna) was an Egyptian monk appointed by the Coptic patriarch. He was consecrated in his new post in Cairo on Jan. 14.

The plans for the construction of a university at Addis Ababa were proceeding. Meanwhile the small university college, which opened its doors on Dec. 11, 1950, had 46 students in their second year and a similar number who began their first year. (See also ERITREA.) (X.)

Education. Schools (1949-50): elementary 540, pupils 60,043, teachers 2,008 (including 286 foreign); secondary (1948-49) 15, pupils 1,079 (including 804 in Addis Ababa). There were 228 students abroad, mostly supported by the government.

Agriculture. Coffee production ('000 metric tons, 1948; 1949 in brackets): 115 (115). Livestock ('000 head, 1949): horses 1,100; asses 3,000; mules 1,000; cattle 18,000; sheep 17,000; pigs 8; goats 11,000; camels 2,000; chickens 26,000.

Foreign Trade. (Million Eth.\$ 1949-50; 1950-51 in brackets): imports 74.6 (95.3); exports 68.3 (111.7). Main sources of imports: India 25%; U.K. 13%; U.S. 12%; Italy 9%. Main destinations of exports: Aden 25%; Eritrea 19%; U.S. 13%; French Somaliland 11%. Main imports: cotton piece-goods, machinery, sugar and salt. Main exports (1950-51): coffee 50%; hides 18%; cereals and pulses 10%; oilseeds 10%.

Transport and Communications. Roads: 43,300 mi., of which 11,100 are suitable for motor traffic. Licensed motor vehicles (Dec. 1950): cars 2,500, commercial 1,750. Railways: 486 mi. Air transport (Ethiopian Air lines, 1951, 10 months): mi. flown 1,348,500; passenger-mi. 13,411,416; freight, ton-mi 934,371.

Finance and Banking. Budget (million Eth.\$, 1949-50): revenue 63.3, expenditure 63.2. Monetary unit: Ethiopian dollar. Exchange rate £1 = Eth.\$ 7.00.

EUROPE, COUNCIL OF: see COUNCIL OF EUROPE.

EUROPEAN COAL AND STEEL POOL. The Schuman pact signed in Paris on April 18, 1951, was to establish a coal and steel pool of the production of France, Germany, Italy, Belgium, the Netherlands and Luxembourg. These countries had in 1950 a combined output of 217 million tons of coal, 45.2 million tons of iron ores and 31.8 million tons of crude steel. The pool was to be administered by a High authority of nine, eight nominated for a six-year period by the several governments and the ninth co-opted by the nominated members. The authority was to co-operate with a ministerial council of six, whose consent in certain matters was needed; and it was to be supported by an advisory committee of producers, distributors and consumers appointed by the council. The High authority was responsible to an assembly of 78 representatives, either delegated by national parliaments or elected by universal suffrage. Its members could be removed by a vote of no confidence. A high court of seven justices was to decide on the legality of the authority's orders or recommendations on appeal from governments, producers or consumers. The pact was to run for 50 years but could be amended.

The authority planned the formation of a single market to which all members would have free access on equal terms. It was to encourage expansion and technical progress, improve labour conditions, give financial help, supply non-members at fair prices and bring about qualitative improvement all round. Internal duties and internal discrimination of trade or transport, subsidies, restrictive measures (cartels) and regional divisions of markets were forbidden.

The authority aimed at achieving competitive prices through the publishing of offers from private firms. It would exercise control over all associations of coal, ore, scrap or steel producers and dissolve or re-organize the syndicalized coal-selling agency of the Ruhr mines. It could fix maximum and minimum prices for the home markets and for exports. It could restrict output by imposing quotas and fine firms for

exceeding them; during scarcity, it could ration distribution by priorities and allocations.

In its purely economic aspect, the pact was a coal plan; in politics it spelled steel. In the absence of exports from Great Britain and the Soviet satellites, the pool's output had to satisfy its members' growing needs and provide a surplus for export. The only regular surplus producer among them was Western Germany; having to export about 20% of its production under the Ruhr statute, it had had, however, to import U.S. coal to keep its industries going.

A single market, not cut by tariffs or nationally fixed prices, would neither automatically increase output nor decrease consumption. Since prices ranged from 368 Belgian francs in the Netherlands to B.Fr. 400 in Germany, B.Fr. 500 in France and B.Fr. 685 in Belgium, free prices during scarcity would rise to the higher levels and profit low-cost producers. To offset this, the latter would have to pay a levy to be used for subsidizing high-cost producers in Belgium and France and to close submarginal mines in these countries.

In the first year Germany would pay £5,600,000 and the Netherlands £550,000. During this transition period (five to seven years), Belgium retained its tariff system. By these measures, a levelling of costs was expected though labour costs varied from Belgian Fr. 435 in Belgium to B.Fr. 295 in France and B.Fr. 192 in Germany. Larger coal supplies without which prices could not fall had to come almost exclusively from Germany where coal and coke were slowly gaining over the prewar output. But further production increases depended on more and better equipment and on more miners who would have to be housed. The capital required had either to be derived from self-financing, which meant higher prices, or from abroad. The necessary capital might amount to £225 million over 25 years.

As long as Great Britain and Poland did not resume exports, western Europe was more or less dependent on the Ruhr; Germany, besides, needed foreign exchange from exports outside the pool. In these circumstances, neither prices nor distribution would be left to free competition while allocations would necessarily raise political issues, especially where steel was concerned.

France produced 60% (30 million tons) of Europe's iron ores, and wanted to convert them at home; its ore exports to Germany declined from 5,800,000 tons in 1937 to a little more than 100,000 tons. It imported in addition a million tons from the Saar, 3.5 million tons of coal and 2 million tons of coke from the Ruhr, and produced 8.7 million tons of steel in plants remodelled in part with E.C.A. money; its target under the Monnet plan was 11 million, 3 million for export.

Germany was limited to 11.1 million tons by the Potsdam agreement and the Ruhr statute and was indirectly restricted by compulsory coal deliveries, mainly to France. Its home needs were about 15 million tons. Many of its plants were obsolescent, requiring about £200 million of new capital for a 12 million-ton output. To reduce "excessive economic power," they had been regrouped and deprived of the advantages of the ownership of captive mines. A number might buy at competitive prices 75% of their fuel from captive mines set up as separate enterprises. Once the Schuman part had been ratified all restrictions would cease, France being evidently convinced that its modernized plants using national ore and getting coal and coke at cheap German prices could outstrip its rival who had to import about 30% of its ore; France had never previously turned out more than 9.7 million tons of steel.

The pact camouflaged rather than abolished intense political and economic rivalries. It could succeed only by providing sufficient capital and labour to the Ruhr to raise enough cheap coal and coke to make them go all round. The dearth of skilled miners and steel workers was to be met by

immigration on liberal terms which might in the long run roughly equalize wage levels in the participating countries. The entire concept of a single united market was, however, vitiated by the absence of any guarantee of stable currencies; members were free to inflate, devalue or revalue and upset the pool's price levels.

Once the shortages existing in 1951 had been overcome, distribution at reasonable prices would not be beyond the authority's power; but there was no proof that it could assure plenty. Until it had done so the question of who would go short during scarcity and which groups of workers would be laid off in a depression would agitate labour.

The launching of the plan was greeted with enthusiasm in France and Germany; by the end of the year public opinion was more critical. The French might be accepting it in the hope of securing the coveted ascendancy in the steel trade, the Germans seeing in it the quickest way to get rid of hampering restrictions.

By the end of 1951 the treaty had been ratified by the Netherlands and ratification had been approved by the French National assembly; just after the end of the year the Western German Bundestag also approved ratification. The British government announced that it would maintain permanent representation with the High authority when it was set up.

(M. J. B.)

EUROPEAN RECOVERY PROGRAMME.

Although U.S. economic aid to western Europe, which since 1948 had been dispensed under the European Recovery programme (E.R.P.) or Marshall plan, would continue till June 30, 1952, and probably beyond, the European Recovery programme proper came to an end, one year before its appointed time, in 1951. The event that marked its end was the passing of the U.S. Mutual Security act on Oct. 10, 1951, which changed the conditions, purposes and qualifications for U.S. aid to western European countries. Before surveying the events of 1951 in detail, it seems therefore proper to summarize the history of E.R.P. which led up to these events.

The idea of E.R.P., outlined by the then U.S. secretary of state, George C. Marshall, in a speech at Harvard on June 5, 1947, was that the United States, through an unprecedented act of inter-governmental peacetime generosity, should finance a co-operative effort of war-devastated Europe to put itself economically back on its feet. The United States offered to the countries of Europe very large loans and grants, asking nothing in return but a joint plan and effort to achieve independence from outside aid within a stated time. In a sense, it might be said that through the offer of E.R.P. the United States undertook to bear the European reparations burden of World War II.

Underlying this unprecedented offer, though not embodied in the diplomatic instruments finally exchanged, were several political purposes. The offer was made at a time when the wartime alliance between the United States, Great Britain and the U.S.S.R. had given way to definite antagonism between the U.S.S.R. and the West, and when the U.S.S.R. had, through the Iron Curtain, split Europe in half. It was originally made to all European countries, on both sides of the Iron Curtain, and even to the U.S.S.R. itself, and it might in this form have been intended as a last attempt to change Soviet Russia's mind, remove the Iron Curtain and re-establish an undivided Europe. After the Soviet government had rejected the offer for itself and forced its reluctant satellites also to reject it, E.R.P. became in the first place the means to stop the economic decline in war-shattered and insolvent western Europe, which exposed it to the increasing danger of Communist subversion and Soviet domination.

A second purpose was, in the minds of many of the U.S. sponsors and some of the European recipients of E.R.P.,

coupled with this primary one: namely, to provide an incentive for European economic and political union. The U.S. government, tactfully anxious not to appear to use economic pressure for political ends, limited the expression of this wish to an insistence on a joint and co-operative European recovery effort, and on mutual aid as well as self-help. The first U.S. aid administrator, Paul G. Hoffman, however, made it clear that he expected an effective European joint recovery to take the form of a merger of Europe's national economies in a large free trade area within a customs union, implying in all probability also a political union. However, while these ideas were enthusiastically shared by some continental governments—especially the French, the Italian, and later the Western German government—they were rejected by the British and by the Scandinavian governments, who insisted on keeping European economic co-operation on a strictly voluntary inter-governmental basis, leaving economic and political national sovereignty unimpaired. As a consequence, E.R.P. and the movement towards European union never joined company. The Organization for European Economic Co-operation (O.E.E.C.), which dealt with the distribution of Marshall aid and the freeing of inter-European trade, never tried to become a supra-national authority, and the movement towards European union proceeded through other, narrower channels. There was no doubt that this development somewhat cooled the U.S. enthusiasm for E.R.P., although it did not prevent the very large annual aid appropriations from passing congress on a slowly decreasing scale.

A second international development to affect the course of E.R.P. was the increasing tension between the West and the Soviet Union, which gradually added to the danger of economic collapse and internal subversion in western Europe, which had seemed paramount at the inception of E.R.P., the danger of military aggression. Of the 18 countries participating in E.R.P., 10 joined, in 1949, with the United States and Canada in the North Atlantic treaty to guard against this danger in a defensive alliance. These countries became eligible for separately administered military assistance. This military assistance was at first conceived on a smaller scale than economic aid under E.R.P., but after the outbreak of the Korean war in June 1950 many Americans began naturally to attach greater importance to military assistance to their allies than to economic aid given to allies and neutrals alike.

A third factor making for the premature end of E.R.P. was its own extraordinary success, which surpassed all expectations. Scheduled to last for four years, during which the European economy was to attain the conditions for internal prosperity and external solvency—especially *vis-à-vis* the dollar area—it had already within two years enabled Europe to surpass its prewar production on an average by 30%. A specific dollar problem remained, and economic forecasters expected it to remain even after E.R.P. would have run its full course till June 1952. But the outbreak of the Korean war and the extraordinary increase in the U.S. buying which followed it made even this dollar gap temporarily disappear, thus proving that the existence or non-existence of a dollar gap depended on many other factors besides European production and could not by itself be regarded as a yardstick of completeness in European recovery. The situation following the Korean war confronted Europe with several new economic problems, especially those of a serious world raw materials shortage, a change for the worse in terms of trade with primary producers, and the economic demands of rearmament. But these were not the problems with which E.R.P. had been designed to cope.

As a consequence, few of the original ideas underlying E.R.P. remained operative in the beginning of 1951. Its direct economic purposes—the restoration of western European production and the elimination of western Europe's dollar

deficit—had been largely fulfilled ahead of expectation, the first permanently, the second at least temporarily. The danger of Communist subversion in western Europe had receded. The new danger of Soviet aggression had to be dealt with by other means and in another context—that of the North Atlantic Treaty organization (*q.v.*), only partly overlapping with the organs of E.R.P. So had the aspirations towards European union, now embodied in the plans for a European Coal and Steel Pool (*q.v.*) and a European Defence community, whose membership comprised only 6 of the 18 E.R.P. countries. E.R.P. itself had long ceased to be a vehicle of European unification, had never been a vehicle of European military defence and had largely fulfilled its purpose as the instrument of European political defence and economic rehabilitation.

By the beginning of 1951, therefore, the structure of the U.S. aid under E.R.P. had begun to crumble. The largest recipient, Great Britain, had agreed to a suspension of aid as from Jan. 1, 1951. Ireland followed on May 2, 1951, and Sweden and Portugal on July 31, 1951. Though the other recipients continued to draw aid, few exhausted their allocations, so that by July 1, 1951, a sum of \$818 million (of an original annual appropriation of \$2,526 million for 1950-51) remained unspent. William C. Foster, head of the U.S. Economic Co-operation agency (E.C.A.), which administered the E.R.P. aid, announced on July 31 that the progress of recovery in western Europe was such that it would become possible to limit dollar assistance to a few special cases were it not for the Soviet design to subvert and subjugate the European allies of the United States.

Accordingly, the U.S. congress passed on Oct. 10, 1951, the Mutual Security act, which abolished E.C.A. and merged all U.S. aid dispensations abroad under a new Mutual Security agency (M.S.A.). The Mutual Security agency was to continue the activities of E.C.A. but make effective rearmament rather than economic recovery the purpose of further aid. After June 30, 1952, by which time the liquidation of E.C.A. would be completed, M.S.A. would develop and administer aid programmes designed to sustain and increase military effort, including production of equipment and material in each country, or in groups of countries, which received U.S. military assistance. It would also provide such equipment, materials, commodities, services, financial or other assistance as might be found necessary for carrying out mutual defence programmes.

In other words, while financial assistance of a general economic character, as apart from direct delivery of arms and military equipment, was not excluded, the criterion would be its contribution to the recipient country's rearmament effort, and it would be restricted to countries which also received direct military assistance. This group of countries, though not necessarily confined to members of the North Atlantic treaty (Spain, Yugoslavia and Western Germany might also qualify for U.S. military assistance), was not entirely identical with the E.R.P. countries, which included neutrals like Sweden, Switzerland and Ireland. To make its meaning even clearer, congress appropriated to Europe for the year July 1951-June 1952 \$4,818 million of direct military aid and only \$1,022 million of general economic aid, though with several mitigating qualifications: the president was empowered to transfer at his discretion 10% of military aid funds to economic aid, to allocate the \$818 million appropriated but unspent in the preceding year and to help Europe solve its dollar problem by placing defence orders for the U.S. armed forces in Europe. On Oct. 31, W. Averell Harriman was appointed director of the new Mutual Security agency.

While this act meant the end of E.R.P. in the exact form in which it was conceived in 1947-48 and operated in the following years, it extended, in a different form, the type of

intimate economic co-operation between the United States and most of western Europe that E.R.P. had established for a limited time, into an indefinite future. For the rest, E.R.P. left the monument of its success, and an invaluable precedent. It also left two more tangible institutions which survived the conditions that called them to life and might still have important functions to fulfil.

The first of these was the European Payments union (E.P.U.)—the intergovernmental European clearing bank which was established in 1950 with a reserve largely provided by E.R.P. funds, and which enabled the western European countries to resume free multilateral trade among themselves and with the countries of the sterling area. Whether E.P.U. could yet withstand the stresses of economic changes and uncertainties without any further dollar injections was not quite certain. It had a vital permanent function to fulfil, and if it should come to be endangered this would be the most serious consequence of the cessation of E.R.P.

The second surviving institution was O.E.E.C., hitherto the organ for allocating E.R.P. aid among the European recipients. Although no longer able to discharge this basic function, it was unlikely to disappear and might yet prove valuable as a negotiating platform for the economic policies of the various western European governments as an instrument of international economic planning in specific fields. How much real work it would have left to itself by the side of the organs of the closer European coal, steel and defence community and the ones of the wider North Atlantic Treaty organization was, however, hard to predict. Its most important effort in 1951 was a 22-point declaration, issued on Aug. 29, which called in general terms for a 25% increase in European production during the next five years and for continuing co-operation between the member countries to reduce obstacles to trade and develop their association with E.P.U. It was, however, notable that the target of a general 25% increase in production over five years was not elaborated or broken down into details, in striking contrast with the four-year programme worked out by the E.R.P. countries, through the Paris conference which proved to be the forerunner of O.E.E.C., in Sept. 1947, in response to the U.S. aid offer of that year. How effective O.E.E.C. could be as a planning organ without the stimulus of U.S. aid depended entirely on the intentions of the member governments which had to determine O.E.E.C.'s new functions and powers. (S. Hr.)

EXCHANGE CONTROL AND EXCHANGE RATES. From about the middle of 1951, quite apart from seasonal influences and the decline in stockpiling purchases in the United States, some fall in raw material prices and the impact of rising expenditures on armaments in some countries of western Europe brought a considerable shift in the ownership of gold and dollar assets. The sterling area, which had shown the greatest increases up to that point, showed the heaviest losses, while French reserves also declined substantially. Unlike 1949, however, when practically all the movement of gold and dollar assets had been in favour of the United States, the disequilibrium in international transactions was not confined to those between that country and the rest of the world. In fact, up to the end of the third quarter of the year, the rise in U.S. gold reserves was equivalent to only half the loss sustained by the sterling area alone. Among other countries whose reserve position improved, Germany, Belgium and the Scandinavian countries in Europe, and Japan and Indonesia were perhaps the most important.

In the sphere of exchange restrictions the ending of exchange control in Canada was almost the sole bright spot in a picture that became increasingly sombre as the year drew to a close. Import restrictions were relaxed in various Latin-American

countries, mainly in an effort to obtain supplies of imports that threatened to become scarcer. The freeing of forward sterling in December was also a striking development. On the other hand, the more severe restrictions imposed in France and the U.K. as a result of renewed exchange difficulties, together with the mounting rearmament expenditures throughout western Europe, gave the impression that the predominant tendency was towards more rather than less strict exchange controls.

North America. United States. Towards the end of 1950 the disequilibrium in transactions between the United States and the rest of the world had almost disappeared. Less than a year later, however, it had again become considerable, and the "dollar gap" had again become a serious problem for some countries. United States exports rose more sharply than imports in the first half of the year, and thereafter fell less rapidly when the post-Korean buying wave appeared to have run its course. Influenced both by seasonal and temporary factors, the surplus on current account (goods and services), which had shrunk to an annual rate of only \$300 million in the third quarter of 1950, increased steadily to reach an annual rate of almost \$4,500 million in the corresponding period of 1951. In the first half of the year the surplus totalled about \$1,800 million. In this period U.S. government economic and military aid amounted to almost \$2,300 million with the latter taking an increasingly larger share of the total.

Canada. Already in 1950 the Canadian government had allowed the exchange rate for U.S. dollars to fluctuate in accordance with free market forces. Because of the continued strength of the Canadian international economic position, influenced by a steady inflow of capital from the United States, the Canadian dollar continued to appreciate, reaching 1·036 to the U.S. dollar at the end of Nov. 1950, as compared with the par value of 1·10 established in 1949. In these circumstances the Canadian authorities took a step without precedent since the end of World War II and amended the Foreign Exchange Control regulations on Dec. 14, 1951, to remove all existing restrictions on payments or on receipts of foreign currencies. In the last days of the year the exchange rate for the Canadian dollar was steady at about 1·025 to the U.S. dollar.

Latin America. In general the economic position of Latin America was strong in 1951, mainly as a result of continued favourable terms of trade, and there were relatively few changes in exchange rates or regulations in that area. Of those that did occur, the steps taken to unify the rate structures in Colombia and Paraguay were the most significant.

Argentina. The Argentine peso continued to show signs of weakness in 1951. The curb rate was P. 29 to the U.S. dollar at the end of September, as compared with P. 19·50 at the end of 1950, and in October the Argentine Central bank suspended the issue of prior exchange permits for the import of goods to be paid for with foreign exchange obtained in the free market. Thereafter the curb rate strengthened appreciably.

Brazil. Minor changes were made in the exchange regulations. Compensation or barter transactions in certain commodities, which had been permitted prior to Feb. 8, 1951, were suspended after that date. In order to legalize dealings in notes and coins and to encourage the inflow of new foreign capital, preparations were also made to create a special free exchange market. In anticipation that the curb market would be legalized, the curb rate, which had fallen as low as 32·50 cruzeiros per U.S. dollar in the summer, hardened somewhat and stood at Cr.\$ 29·20 to the U.S. dollar at the end of November.

Chile. In the course of 1951 some modifications, particularly the application of mixed rates to certain agricultural exports,

WORLD EXCHANGE RATES, DEC. 31, 1951.

were made in the Chilean multiple-rate structure in effect since Dec. 1950. In addition, the scope of the free market was substantially restricted. The rate for the U.S. dollar in this market had appreciated steadily in 1950 to about 70 pesos to the U.S. dollar. Because of increasing inflationary tendencies within the country, however, it had weakened to more than P. 90 by July 1951. To meet this situation the National Foreign Trade council adopted several measures to restrict dollar imports. After July 18 the purchase of various goods previously imported from the dollar area with exchange obtainable in the free market was permitted only in countries with which Chile had payments agreements. Exchange transactions for all imports still permitted from the dollar area with exchange obtainable in the free market were not permitted until after the arrival of the shipping documents in Chile and had to be completed at the exchange rate then prevailing. Free market exchange transactions connected with trade had to be carried on only through authorized banks, which were forbidden to purchase free market exchange for their own account and were required to post exchange rates and report both these and the volume of transactions daily to the National Foreign Trade council.

Colombia. On March 20 the Colombian government took an important step to simplify the complicated multiple-rate structure hitherto in effect and to reduce restrictions on imports. A new rate of 2.50 pesos to the U.S. dollar was made applicable to all foreign exchange transactions except coffee exports. A total of 25% of the exchange proceeds from the latter received the new rate, while the old buying rate of P. 1.95 to the dollar was applied to the remaining 75%, thus giving an effective rate of 2.0875 for coffee exports. Apart from the prohibition of specified luxury imports, all licensing restrictions were progressively removed, as were the exchange certificate system and all mixed rate arrangements. Most of the differential exchange taxes were also abolished, and a uniform stamp tax of 3% on practically all foreign exchange sales took their place. The new system did not involve any change in the existing par value of P. 1.94998 to the U.S. dollar, but the International Monetary fund approved it as a step toward the eventual declaration of a new par value.

Paraguay. At the beginning of March, after prolonged consultation with the International Monetary fund, the government of Paraguay declared a new par value for its currency of 6 guaranies to the U.S. dollar. At the same time sweeping changes were made in the exchange rate structure, reducing the number of rates for both imports and exports, narrowing the spread between the higher and lower rates and thus simplifying a very complicated multiple-currency system. Free market rate quotations began at 20 guaranies to the dollar but weakened substantially in subsequent months, standing at 33 to the dollar in October.

The Sterling Area. In 1951 the weakening in the position of the sterling area, and particularly of the United Kingdom, was almost as spectacular as the improvement had been in the previous year. Because of an increased trade deficit arising mainly from an adverse movement in terms of trade, the United Kingdom had an over-all current account deficit equivalent to \$342 million in the first half of the year, as compared with surpluses equivalent to \$118 million in the first half and more than \$500 million in the second half of 1950.

At \$305 million, the United Kingdom dollar deficit was as large as it had been in the whole of 1950, and a current account deficit equivalent to \$73 million was recorded with the Organization for European Economic Co-operation (O.E.E.C.) countries, as compared with a surplus equivalent to \$342 million in the previous year. Current transactions with the rest of the sterling area resulted in a surplus equivalent

The table shows official par values agreed with the International Monetary Fund or average of buying and selling rates.

to only \$129 million or less than half the 1950 rate, and was accompanied by an export of capital from the United Kingdom at an accelerated pace. Despite some deterioration in the terms of trade resulting from declining raw material prices, the position of the rest of the sterling area remained strong, and its surplus with the dollar area, at \$415 million, was almost as large as for the whole of 1950. Substantial amounts of hard currency were also earned from transactions with the European Payments union, from gold sales by sterling area countries to the U.K. and from capital transactions, so that for the first half year the sterling area had a gold and dollar surplus of \$414 million equal to the rate for the previous year. Receipts from the Economic Co-operation administration (E.C.A.) for goods in the "pipe line" brought the increase in the central reserves of gold and dollars up to \$568 million so that at the end of June they stood at their postwar peak of \$3,867 million.

In the second half of the year, however, the gold and dollar reserves of the sterling area fell by no less than \$1,532 million bringing them down to the lowest level since the middle of 1950. In the last quarter changes in the timing of payments resulting from a certain loss of confidence in sterling were obviously important. In this period the sterling area's position in the European Payments union deteriorated markedly so that by the end of October the United Kingdom had not only repaid all the gold it had received from the E.P.U., but had also received from it credits amounting to the equivalent of \$356 million and had made net gold payments to it of \$36 million.

To halt the drain on the reserves new restrictions were imposed in November on payments to non-sterling countries. Imports were to be cut sharply, a step which involved the reimposition of quota restrictions on imports from other countries of western Europe, a reduction in the rate of stockpiling and in tourist allowances. These cuts were estimated to yield total savings equivalent to about \$1,000 million in 1952.

As a further step aimed at restoring confidence in sterling, the Bank of England, on Dec. 15, ceased to quote official exchange rates for forward exchange and restored freedom to the commercial banks to deal in forward sterling at market rates. Banks were permitted to deal in U.S. dollars only with banks in the American account area. At the same time, although spot sterling remained fixed at \$2.80 to the pound, the spread between the buying and selling rates was widened to allow sterling to fluctuate between \$2.77 and 2.83, depending on supply and demand. These relaxations in the British exchange control system were of limited scope. Sterling remained inconvertible, and import restrictions were tighter than before. The measures were significant in that they were the first important moves made since 1939 towards a free market in foreign exchange. In the following days there was a significant recovery in forward sterling in New York, while the Federal Reserve bank of New York, as agent for the Bank of England, did not have to buy spot sterling for support purposes. There had been no changes in exchange rates in the sterling area in 1950, but in 1951 the controversy surrounding the Pakistan rupee, the only sterling area currency not devalued in Sept. 1949, ceased after the International Monetary fund announcement, in March, of the establishment of the initial par value for the Pakistan rupee at Rs. 3.30852 to the U.S. dollar, the rate proposed by the government of Pakistan and corresponding to the existing effective rates.

Continental Europe. In Europe the most striking developments in 1951 were the shifts in payments relations among western European countries and the tightening or relaxation of import and exchange controls which resulted from them. These changes were reflected clearly in the transactions of the

European Payments union. At the beginning of the year the United Kingdom and France had built up large surpluses and were receiving substantial gold payments from the E.P.U., the Belgium-Luxembourg Economic union was more or less in balance with the E.P.U., and Denmark, the Netherlands and in particular Germany had run up very large deficits. At the end of November the British and French cumulative surpluses had disappeared, and they were running substantial deficits with the E.P.U. The Netherlands and Denmark were improving their positions, while Portugal, Sweden, Switzerland and particularly Italy and Belgium had large surpluses.

Unlike 1950, when its currency had weakened slightly, the international economic position of Belgium became progressively stronger in the course of 1951. Mainly as a result of increased steel exports, the country's monetary reserves exceeded \$1,000 million equivalent at the end of November, having risen by more than \$250 million equivalent since the end of 1950. In these circumstances various measures were taken by the Belgian monetary authorities to reduce the payments surplus with other European countries and thereby the need to extend them additional credit. On the one hand, for instance, complete freedom was given to Belgian capital for investment in all E.P.U. countries except Switzerland. On the other hand, however, in order to restrain Belgian exports, and also the inflow of hot money, the import of Belgian bank notes into the E.P.U. was further restricted, and Belgian banks' purchases of E.P.U. currencies were subjected to a tighter control by the monetary authorities.

In Finland, on June 28, 1951, after consultations with the International Monetary fund, an initial par value of FM. 230 to the U.S. dollar was established. This step was made possible by the greater degree of internal financial stability in Finland and by the sharp improvement in the country's balance of payments resulting from the rise in timber and pulp prices.

The second half of the year saw a significant deterioration in the French foreign exchange position. This was mainly caused by an outflow of capital from France. At the end of November the curb rate in Paris stood at Fr. 445 to the U.S. dollar, as compared with about 380 at the end of 1950. To prevent further capital flight and reduce the pressure on reserves the government took various measures in October and November. The issue of dollar import licences was cut sharply, while importers of goods entirely or partially freed from quantitative import restrictions, coming mainly from other E.P.U. countries, were permitted to pay for the imports only after they had been delivered in France. Furthermore, French commercial banks were obliged to transfer to accounts of the Stabilization fund with foreign central banks any balances in excess of those held on June 6, 1951.

The position of Western Germany changed radically in 1951, particularly in relation to other European countries. In the spring its deficit with other E.P.U. countries had become so large that not only had Western Germany to be granted a special gold loan from the European Payments union, but was also unable to adhere to the O.E.E.C. programme of liberalizing intra-European trade and payments, and had to impose special restrictions on imports from these countries. By the end of the year, however, Western Germany was recording substantial surpluses with the European Payments union, had recovered all the gold and dollars paid to E.P.U. in the latter part of 1950 and had more than doubled its foreign exchange assets.

An important technical change was made in the Greek foreign exchange system on June 1. Hitherto persons offering foreign exchange to the central bank for sale received certificates of exchange, while those wishing to purchase exchange had to present such certificates. The prices of these certificates, which had been maintained by the Bank of Greece at Dr. 10,000 to the U.S. dollar and Dr. 22,000 to the pound sterling, were

henceforth incorporated in the official exchange rates and the certificate system abolished. This step, however, did not entail any change in the effective official exchange rates.

Spain simplified its multiple-exchange rate structure further in 1951. The various export rates previously in effect, which had ranged from 10·95 pesetas to the U.S. dollar to the free rate, were replaced from Nov. 1 by a single rate of P. 21·90 to the dollar. This rate was applicable to 100% of most export proceeds, including those from fruit exports, but certain exports were encouraged by the fact that exporters of them were entitled to sell from 10% to 90% of their proceeds on the free market. Import rates remained unchanged.

On Aug. 31 Sweden became the 50th member of the International Monetary fund, and on Nov. 5 the initial par value for the krona was established at Kr. 5·17321 to the U.S. dollar. Effective exchange rates thus remained unchanged.

Late in December the Yugoslav government announced a change in the exchange rate of its currency from 50 to 300 dinars to the U.S. dollar to take effect from Jan. 1, 1952. This step, which had the approval of the International Monetary fund, was much more than a devaluation. Hitherto the exchange rate, like others in eastern Europe, had had little influence on the volume or direction of the country's foreign trade which was conducted by state-owned agencies in accordance with the plan of the central government and was not determined by relative prices in Yugoslavia and foreign countries. Under the new system independent industrial units would remain state-owned but would be permitted to trade with foreign countries. The exchange rate would exercise its normal function of determining what would be exported and imported.

Middle East. Only minor modifications were made in exchange control systems in the middle east. In Egypt changes in the exchange regulations were made which had the effect of increasing the freedom of exporters to use their foreign exchange proceeds. For instance, exporters selling cotton to the U.S. in excess of the quota were allowed to retain 30% of the dollar proceeds to pay for their own imports of specified goods. Partly as a result of these steps, the value of the Egyptian pound in the free exchange market slipped somewhat lower throughout the year.

On June 25, Iraq took certain steps to eliminate exchange losses and to move towards the unification of its multiple-rate structure. By buying exchange from exporters at 48·50 rials* to the U.S. dollar and selling part of it to importers of essential goods at the rate of Ri. 40, the government had incurred substantial losses. Under the new system the rate at which export proceeds were sold to the monetary authorities was reduced to Ri. 47 while the rate for essential imports was raised to Ri. 41·50 and that for non-essentials lowered from Ri. 48·50 to Ri. 47 to the dollar. At the same time certain imports were shifted from the essential to the non-essential group. By this means the government aimed at equalizing purchases of exchange from exporters and sales to importers of non-essentials at the same rate of Ri. 47 to the dollar. In the latter half of the year Persia's foreign exchange position worsened as a result of the government's dispute with the Anglo-Iranian Oil company and the consequent stoppage of oil production and exports.

In Syria the scope of the free market was widened in September when the government revoked the regulation requiring foreign tourists and receivers of remittances from emigrants to surrender 10% of their exchange holdings to the exchange office at the official rate. In the Beirut (Lebanon) free market the most noteworthy feature in 1951 was the tendency for sterling and particularly French francs to be traded at an increasing discount in the latter half of the year.

* 5 rials = 1 dinar.

Far East. In the far east significant changes in exchange rates and regulations resulted from the consolidation of Communist control on the Chinese mainland. On Jan. 20 the Peking government announced a new exchange rate for the People's yuan of 3,880 yuan to one Hong Kong dollar. Thereafter, the special currencies previously issued by the Communist régime in Manchuria and Inner Mongolia were abolished, and the People's yuan was made the sole legal tender in those areas also. There were signs of an outflow of capital from China. The demand for gold and dollars was steady in Hong Kong where the People's yuan was quoted at a substantial discount in the open market. The volume of transactions was small, however, particularly after controls on trade with China were tightened in the summer.

In an effort to control imports more effectively, the Philippine government imposed, on March 28, a 17% tax on sales of foreign exchange except those to be used to import specified essential commodities, mainly foodstuffs and drugs, and for designated nontrade payments, primarily insurance. This raised the selling rate from 2·015 to 2·358 pesos to the dollar, and after its imposition the spread between the free rate and the official rate (with tax) shrank further, the former falling from about 3·80 to less than 3 pesos to the U.S. dollar. (See also INTERNATIONAL MONETARY FUND.)

EXPLORATION AND DISCOVERY. The exploration of Antarctica (*q.v.*) continued to attract the largest and most elaborately equipped expeditions; the Norwegian-British-Swedish expedition continued its operations throughout the year and the "Norsel" sailed for Queen Maud Land again in Oct. 1951, this time to bring the expedition home in 1952. The French expedition in Adélie Land also returned in 1951 and a new venture, under the leadership of Duncan Carse, sailed for South Georgia in Oct. 1951. The stations in the Falkland Islands dependencies were maintained throughout the year.

In the Arctic, a new expedition of considerable magnitude was being organized in Great Britain for the exploration of Queen Louise Land in northeast Greenland. The expedition, which would be recruited largely from officers of the Royal Navy under the leadership of Commander C. J. W. Simpson, was completing its plans to sail in 1952. The leader visited and reconnoitred the proposed area of operations with a small advance party during the summer of 1951. The lake to which they were flown, within two days' march of the proposed base, was the "furthest north" landing to date for an R.A.F. flying boat.

A very different topic of investigation took Miss Marjorie Findlay to the southern extremity of Greenland for eight weeks in the summer. She travelled among the Eskimo sheep farms of the Julianehab district to observe the changing way of life of a community that had substituted sheep farming for the traditional employments of fishing and hunting; one of the complications was that Greenland sledge dogs do not agree with sheep. Yet this was where the Viking farmers had settled and gave Greenland its name; the Viking colony persisted into the middle ages and was then lost sight of.

In Iceland a party from Durham university made meticulous measurements of the variations in air temperature near the surface of the Breidamerkurjökull glacier and mapped this and other adjacent glaciers on a large scale so that its recession in the changing climate could be recorded. Peter Scott and James Fisher also travelled in Iceland to observe the breeding grounds of the pink-footed goose; this was in connection with the ringing of these birds at the Severn Wild-fowl trust. In Norway a succession of parties of Cambridge

A panoramic view, taken from 20,000 ft. on Pumori, showing, left to right, the North Peak, the North Col, Mount Everest, the ice-fall (foreground) leading to the West Cwm, with Lhotse (centre background) and Nuptse. The photograph was taken by the Mount Everest Reconnaissance party led by Eric Shipton in late 1951.

undergraduates spent a week or more on the Skauthobreen glacier in the Jotunheimen, strenuously working by shifts to drive a tunnel from the face of this steep corrie glacier to the bedrock below. The subsequent study by Cambridge glaciologists of the cross-section revealed by the 400-ft. long tunnel was expected to shed a good deal of light on the mechanics of glacier movement.

Signs were not wanting of a renewed interest in the conquest of Mount Everest. H. W. Tilman published an account of his explorations in the Nepal Himalayas during the summer of 1950, in the course of which he had approached and viewed the mountain from the south. The political situation in Tibet rendered the familiar approach from the Rongbuk glacier to the north more difficult than the penetration of Nepal used to be before the war, and, although the southern face of the mountain appeared to be the steeper of the two and human transport would have to take the place of pack animals, there were certain advantages in having one's base in the more agreeable Alpine valleys of the Nepal Himalayas.

The Mount Everest Reconnaissance expedition, 1951, under the joint auspices of the Alpine club and the Royal Geographical society and with the permission and encouragement of the Nepali government, left Great Britain under the leadership of Eric Shipton, himself a distinguished Himalayan mountaineer who had attempted Everest from the other side. There was on this occasion no intention of attempting the summit, but experience was obtained of the weather and snow conditions on this hitherto unvisited face of the mountain and the party penetrated the West Cwm which lies below it to examine the approaches at close range. Shipton's finding of footprints on a glacier revived the old controversy concerning the "abominable snowmen" of the Himalayas, but scientific opinion inclined to attribute them to a race of the langur monkey (*Presbytis entellus*). Another controversy revived by this expedition was the exact height of Everest. An authoritative statement still placed it at 29,002 ft. and observation by modern methods from nearer points would be needed to establish a more reliable figure; though there were indeed indications that the old value had been underestimated by as much as 100 ft.

Richard Goodchild, of the British school in Rome, continued his archaeological exploration of Cyrenaica, establishing the limits of the Roman occupation of that country in collecting material for a map of Roman Cyrenaica, and studying the geographical environment in which the Roman colonies flourished in what is now almost or quite a desert.

An expedition organized by the Oxford University Exploration club went to the Kiunga archipelago on the east African coast, principally to study birds, but the U.S. geographer

Walter W. Deshler who accompanied the expedition sought out the lost Arabian settlements which flourished here before the advent of the Portuguese. H. St. J. B. Philby, the veteran explorer of Arabia, was in the Najran country on the borders of Yemen at the close of the year, looking for Himyaritic inscriptions.

In 1925 Colonel P. W. Fawcett set out in search of a lost city in the forests of the Matto Grosso, Brazil, never to be certainly heard of again, though hardly a year has passed without some strange account of his survival there, either free or in captivity, being brought back to civilization. In 1951 it was reported that his remains had been found and brought back to England. But the epic was not at an end for an examination of the bones failed to establish their identity with the lost explorer. Another quest which would continue was that for Captain Kidd's lost treasure, for the yacht that sailed to seek it in the China sea was wrecked off the Isle of Wight. (See also ANTARCTICA.) (F. GE.)

EXPORT-IMPORT BANK OF WASHINGTON. In Oct. 1951 congress increased the lending authority of the Export-Import bank from \$3,500 million to \$4,500 million to carry out its purpose of facilitating the export and import trade of the United States. During the calendar year 1951, in close co-operation with the defence agencies, the bank established credits to finance the expansion of capacity and the production and treatment abroad of essential materials for the U.S. stockpile and for use by industry in the U.S. and the free world. The total amount of loans authorized by the bank from the time of its establishment in 1934 to the end of 1951 was about \$5,300 million. Disbursements during 1951 were about \$204.1 million and repayments during the year were about \$134.6 million. Outstanding loans of the bank totalled \$2,300 million at the end of 1951. (S. SD.)

EX-SERVICEMEN'S ORGANIZATIONS. The International Federation of War Veterans' Organizations (Fédération Internationale des Organisations d'Anciens Combattants) founded in Paris in Nov. 1950 by associations from Belgium, France, Italy, Turkey, the United States and Yugoslavia held its second annual conference at Belgrade during Nov. 27-30. With the accession of associations from Canada, Denmark, Greece, Israel, Luxembourg, the Netherlands and the Philippines the federation in 1951 had a total membership of 75 associations grouping some 12.5 million ex-servicemen in 13 countries.

The largest membership was that of France, represented by the Union Française des Associations des Combattants (U.F.A.C.), a federation of 48 associations, some of them Communist-controlled, with altogether more than 2 million members, most of whom were combatants of World War I. Unattached to this union was the Rhine and Danube association grouping ex-servicemen of General Jean de Lattre de Tassigny's First French army.

The United States was represented in the federation by the American Veterans of World War II or "Amvets," the American Veterans' committee, the Disabled American Veterans and the Blinded Veterans association, but the two largest organizations—the American Legion and the Veterans of Foreign Wars—refused to join. Nor were the British Legion or any of the Commonwealth organizations affiliated to the British Empire Service league members of the International federation.

Addressing the conference, Marshal Tito said that the Soviet Union offered the greatest threat to world peace, and resistance to Soviet-Russian imperialism should not be confused with any anti-Communist or anti-Socialist crusade. Albert Morel (France) and Elliot H. Newcomb (United States) were respectively re-elected president and secretary general of the federation.

Great Britain. A parade of 5,000 men and women before the king and the queen in Hyde park on May 12 preceded the annual conference of the British Legion which was attended by 1,440 delegates at the Albert hall, London, May 13-15, in the proportion of five ex-servicemen of World War I to four of World War II. The most important resolution, carried unanimously, was a motion of urgency on pensions put forward by the national executive committee. While expressing thanks to the government for improvements in supplementary allowances to disability pensioners, the resolution indicated that the improvements benefited only some 41,000 war pensioners, and conditions regarding the remaining 665,000 continued to be most unsatisfactory: it accordingly asked for the basic rate of 45s. a week to be doubled and necessary adjustments to be made for pensioners receiving supplementary allowances. (See also WAR PENSIONS.) Sir Ian Fraser, Major General Sir Richard Howard-Vyse and Lord Cromwell were respectively re-elected president,

national chairman and national treasurer of the British Legion.

At its annual conference at Glasgow on June 1 the British Legion (Scotland) adopted a resolution calling for a national war memorial for the fallen in World War II to be put up without delay and incorporated in the National Memorial for the Fallen of World War I in Edinburgh castle. General Sir Thomas Riddell-Webster and Major General Sir James Syme Drew were respectively re-elected president and chairman for the Scottish area.

France. At its session in Paris on July 8, the administrative council of the U.F.A.C., contending that development of armed forces created a danger for all nations, regretted that nothing was done to promote simultaneous, progressive and controlled disarmament. On Nov. 4 it adopted a resolution indignantly protesting against the formation of an ex-servicemen's organization in Germany.

In December a Comité National des Associations d'Anciens Combattants (C.N.A.C.) was formed in Paris by the Union Nationale des Combattants (U.N.C.), a member of U.F.A.C., the Rhine and Danube association and others. The C.N.A.C. decided to launch nation-wide propaganda for efficient national defence.

Germany. On Sept. 8 a Verband Deutscher Soldaten (V.D.S.) was instituted at Bonn and planned as a co-ordinating organization for the two existing welfare associations, the Bund Versorgungsberechtigter Wehrmachtangehöriger (Union of Members of the Armed Forces Entitled to Pension) and Schutzbund Deutscher Soldaten, as well as for many associations of "old comrades" such as from the Afrika Korps, Panzerkorps Gross-Deutschland and the "Green Devils" or paratroopers. A provisional executive committee of 24 members, all former generals, was formed with Colonel General Hans Friessner as chairman. He was received by Theodor Heuss, president of the republic, and Konrad Adenauer, the chancellor, whom he assured that the V.D.S. would support the federal republic and the ideals of parliamentary democracy.

That he was scarcely the man to speak on behalf of 13 million ex-servicemen and to inspire the confidence of the west was soon apparent for when explaining the aims of the V.D.S. to the Foreign Press association at Bonn on Sept. 21 he said that the reason for German aggression against Poland

King George VI taking the salute at a march past of the British Legion in Hyde Park, London, May 12, 1951. The parade was led by the band of the Welch regiment.

in 1939 was that "the red flood had to be stopped and that the border population had to be protected from the squabbling and chicanery of the Poles." He cited the half-hearted support of Germany's unwilling wartime allies, Hungary and Rumania, as "a classic example of national demoralization." His description of the 1944 plot against Hitler as "an attempt to murder the supreme commander behind the front line" evoked protest from many officers of the former Wehrmacht. He resigned on Dec. 10 and by the end of the year the German ex-servicemen's movement was still far from achieving unity.

(X.)

United States. In 1951 all the U.S. ex-servicemen's organizations had amended their constitutions so that they might accept veterans of the Korean war for membership.

American Legion. In 1951 the legion had a membership of 2.8 million. The national convention held in Miami, Florida, elected Donald Wilson of Clarksburg, West Virginia, as its national commander. Highlight of the convention was an address by General Douglas MacArthur (*q.v.*) who heavily attacked the foreign policy of the administration of President Harry S. Truman. The platforms of the legion also attacked the far eastern policy of the government and of Secretary of State Dean Acheson. It urged immediate adoption of universal military training and extension of benefits to veterans of Korea.

Veterans of Foreign Wars. This organization had a membership of 1 million at the end of 1951. The national convention, in New York, elected Frank C. Hilton of Reading, Pennsylvania, as its national commander. The outstanding event of the convention was the failure of a resolution favouring a bonus for World War II veterans. Among the resolutions passed were: an attack on Secretary of State Dean Acheson; a request for a congressional investigation of the World Federalist movement; a demand that the U.N. boycott Communist China; the banning of Communist meetings; and universal military training.

Disabled American Veterans. This organization had a membership of 125,000 in 1951. The national convention, held at Milwaukee, Wisconsin, elected Ewing W. Mays of Little Rock, Arkansas, as its national commander. The convention attacked the Hoover committee recommendations, urged an increase in disability compensations and asked for benefits for veterans of the Korean war.

American Veterans of World War II. With a membership of 75,000 this was the largest of the organizations for veterans of World War II. The national convention, held in Boston, Massachusetts, elected John Smith of Ohio as its commander. The programme adopted at the convention urged: the ousting of Carl Gray as head of the veterans administration; a G.I. bill of rights for Korean veterans; and a peace and preparedness programme based on co-operation with the United Nations.

American Veterans' Committee. This organization, with a membership of 20,000 in 1951, was the second largest World War II veterans' group. The national convention re-elected Michael Straight of Washington, as national commander. The convention adopted resolutions urging the ousting of veterans administrator Carl Gray, the extension of Korean veterans of the G.I. Bill of Rights, and universal military training.

(R. I. AB.)

EYE, DISEASES OF THE. Further experience in 1951 with the use of cortisone and ACTH in a variety of diseases of the eye made possible evaluation of the effectiveness of the hormones and revealed certain contra-indications as to their use. The most beneficial results were observed in acute inflammatory disturbances of the anterior segment. Administration of cortisone and ACTH in tuberculous animals and in animals with induced tuberculous eye lesions

resulted in reactions that indicated the drugs should be used in such cases with caution, if at all. ACTH and cortisone, given by injection into the muscles, were shown to inhibit the mechanism by which a focal tuberculous lesion is walled off by fibrous tissues. The tubercle bacilli were found to be more numerous and were more rapidly and widely disseminated in the cortisone-treated animals.

A new technique in an old and accepted treatment of certain stages and types of chronic glaucoma promised better results, with less risk, according to findings in a small series of clinical cases. The procedure was called cycloelectrolysis because electrolysis was used instead of diathermy to cause destruction of the ciliary body within the eye. In cycloelectrolysis a chemical reaction occurred between sodium hydroxide, formed at the cathode, and the tissues, causing liquefaction of the adjacent cells. In cyclodiathermy the strong current produced enough heat to cause tissue destruction. The new technique of treating all types and stages of glaucoma by cycloelectrolysis was advocated for persons of deeply pigmented skin because of the keloid reaction following conventional surgical operations for glaucoma. With cycloelectrolysis there was a minimal proliferative reaction and hence less probability of a tissue reaction that reversed the anticipated result.

The mechanism of glaucoma was somewhat elucidated by a carefully controlled series of measurements of the rate of flow of aqueous humour in the human eye by a method of tonography. W. Morton Grant demonstrated, by means of statistical analysis of data obtained by measuring the intraocular pressure with a tonometer, that the rate of aqueous formation and its outflow averaged 2.4 cu.mm. a minute. He measured the rate of flow of aqueous in many eyes with different types of glaucoma, and in none of them could he demonstrate an overproduction of aqueous. He concluded that in glaucoma there was an impediment to the outflow of aqueous, which accounts for the rise in intraocular pressure. In those cases of glaucoma which had been successfully operated on, a return to normal, or even subnormal, rate of flow of aqueous was found. The results of investigations by others confirmed Grant's conclusions.

Ophthalm.*, 46: 113-124 (Aug. 1951); Arlington C. Krause and James O. Bond, "Neutron Cataracts," *Am. J. Ophthalm.*, 34: 25-35 (Jan. 1951).

FAEROE ISLANDS (FAERÖERNE). Self-governing part of the kingdom of Denmark in the north Atlantic situated between Iceland and the Shetland Islands, about 200 mi. N.W. of the latter. Area: 540 sq.mi.; there are 21 islands, of which 18 are inhabited. Pop.: (1935 census) 25,744; (1945 census) 29,198. Language: Faeroese, akin to Icelandic rather than to Danish. Religion: Lutheran. The capital is Thorshavn, on the island of Strömö (pop. 1945, 4,390). Governor general, C. A. Vagn-Hansen.

History. During 1951 the Faeroese terms of trade deteriorated, due to rising import prices and stable or decreasing export prices on fish and fish products. The result was a grave crisis in July and August for the Sjóvinnu bank which, with a share capital of Kr. 2.4 million had invested in post-war years Kr. 28.7 million, principally to modernize the trawler fleet. Most of the share capital was lost, but the crisis was overcome by the subscription of new shares in the islands and by a Kr. 2 million loan from the Danish government. The bank crisis had political consequences, since the former manager of the bank, Thorstein Petersen, the leader of the Folkeflokkurin, favouring Faeroese independence, had to leave the Landsstyre (the local government).

Fisheries. Export (1950, metric tons): iced fish 3,355; salted and

dried fish 36,000; salted herring 1,000; whale oil 2,454; whale meat 304; liver oil 1,835; herring oil 110; canned fish 49.

Foreign Trade. Exports (1950): Kr. 74.2 million, including Kr. 20 million to Italy, Kr. 9 million to Denmark and Kr. 5 million to Britain. Imports (1950): Kr. 65.6 million, including Kr. 52 million from Denmark and Kr. 11 million from Great Britain. (H. LN.)

FAIRS, SHOWS AND EXHIBITIONS. The outstanding exhibitions of 1951 were those of the Festival of Britain—the South Bank exhibition, London, a land travelling exhibition which visited Manchester, Leeds, Birmingham and Nottingham and a seaborne exhibition in the converted aircraft-carrier “Campania” which visited Southampton, Dundee, Newcastle-upon-Tyne, Hull, Plymouth, Bristol, Cardiff, Belfast, Birkenhead and Glasgow. In Scotland there was an exhibition of industrial power at Kelvin hall, Glasgow, and in Northern Ireland a farm and factory exhibition. From May 4 to Sept. 30, 8,455,863 persons visited South Bank, 462,289 the land travelling exhibition and 889,792 the “Campania.” (See FESTIVAL OF BRITAIN 1951).

Associated with the Festival of Britain were many exhibitions throughout the country. Among these were the bicentenary exhibitions of Worcester porcelain in London and at Worcester (May-September), an Anglo-Jewish exhibition at University college, London (July 9-Aug. 3), the Royal Society of Arts “Exhibition of Exhibitions” (May-October), a photographic display by *The Times* covering the period 1921-51 (May 7-29) and a Regency exhibition at Royal Pavilion, Brighton (July 16-Aug. 26) which attracted over 120,000 visitors. Some of the City of London guilds held exhibitions telling their history.

The National Book league sponsored more than 50 exhibitions of books outside London. These included displays at Plymouth, Lichfield, York, Belfast, Glasgow, Edinburgh and in the library of Glanllyn, Llanywchyllin, Merionethshire.

The 30th British Industries fair was again held at Olympia and Earls Court, London, and at Castle Bromwich, Birmingham (April 30-May 11). There were nearly 3,000 exhibitors—of which 1,246 were at the heavy section at Castle Bromwich—19,266 overseas buyers and 99,455 home buyers. The king and queen visited Earls Court; Queen Mary visited Earls Court and Olympia, and Princess Margaret went to Castle Bromwich. A Welsh Industries fair was held at Cardiff (June 4-14).

The total attendance of 373,129 at the 36th Motor show at Earls Court (Oct. 17-27) was 102,197 fewer than in 1950. The Motor Cycle and Cycle show—not held in 1950—took place in 1951 at Earls Court.

The Radio show (Aug. 28-Sept. 9), held for the first time at Earls Court, attracted 232,752 visitors. The first national packaging exhibition to be held in London opened at Olympia on Jan. 30. It was sponsored by the Institute of Packaging and was prompted by the success of a similar event in Manchester in 1949.

Agricultural Shows. The show of the Royal Agricultural Society of England was held at Trumpington, Cambridge (July 3-6); the show covered 150 ac. and the total attendance was 131,333. The livestock entry was 4,697 head.

Gloucester was the site of the Three Counties show (June 12-14) and Dorchester, for the first time since 1928, that of the Bath, West and Southern Counties show (May 30-June 2). The total attendance at the “Bath and West” was 89,329, over 17,000 more than at Birmingham in 1950. The Great Yorkshire show at Harrogate (July 10-12), received more entries, 3,308, than in any of the 104 years of the show's existence. For the first time, only animals from attested herds were accepted. The Royal Counties show was held at Stoneham, near Southampton (June 20-23). An idea of the success of this show can be gauged from the fact that during the period 1883-1950 over 2,297,000 people paid for admission.

An exhibit from the Soviet Union at the 1951 Milan fair (April 12-29). This was the first time for 17 years that the Soviet Union had exhibited at Milan.

The 1951 attendance was nearly 51,000. The Royal Highland show was held at Hazelhead, Aberdeen (June 19-22), and the Royal Welsh show at Llandrindod Wells (July 25-27). The Royal Lancashire show was held at Witton Park, Blackburn (Aug. 1-4).

The 65th annual Dairy show was held at Olympia (Oct. 23-26); the attendance was 66,679, compared with 96,867 in 1950 and 103,341 in 1949. The Smithfield show and Agricultural Machinery exhibition at Earls Court (Dec. 3-7) was marred by restrictions on the movement of animals following outbreaks of foot and mouth disease and swine fever. Despite these restrictions, more than 650 animals were on display. All animals had to be slaughtered in the London area after the show. The attendance of 66,003 was the largest for 48 years.

A record entry of 1,500 was received for the International Horse show at the White City, London (July 23-28); Spain, Italy and Ireland entered official teams in the show-jumping events. The Royal Dublin society's horse show was again held at Ballsbridge, Dublin, in August. The Horse of the Year show was held indoors at the Harringay Arena, London (Oct. 3-6).

Canada. At the fourth international trade fair at Toronto (May 28-June 8) 20 countries were represented, Canada and Great Britain again having the biggest displays. A British motor show, the third in three years, was held in Montreal in March.

Czechoslovakia. At the 52nd Prague International fair (May 20-June 3) the largest display was that of the U.S.S.R. There were state exhibits from the people's democracies and Eastern Germany, Egypt, Pakistan and Turkey, and commercial exhibits from eight other countries, including Great Britain.

Germany. The annual shows were again held at Leipzig in Eastern Germany (March 4-11; Sept. 2-7) and at Frankfurt in Western Germany (March 11-16; Sept. 2-6). The German Industries fair was held at Hanover in two sections, light industry (Feb. 27-March 4) and heavy industry (April 29-May 8). Started by the British authorities in 1947 as the Hanover fair, it had by 1951 become the German Industries fair. There were 8,352 exhibitors from Germany and 16 other countries at the Leipzig spring fair. The largest overseas exhibit was the pavilion of the U.S.S.R. which attracted 100,000 visitors in the first two days. China was represented for the first time. Great Britain was the largest overseas exhibitor at the Frankfurt spring fair.

Greece. For the first time since before World War II, the Salonika international fair was again held (Sept. 16-Oct. 3). There were 5,800 exhibitors including 350 foreign firms.

United States. A small trade fair with exhibits from ten countries was held in Washington during "World Trade week," May 21-26; similar shows were held in 80 other cities throughout the United States.

FALKLAND ISLANDS. British colony and two groups of dependencies in the South Atlantic. The colony consists of East and West Falkland and adjacent islands. Dependencies: (1) South Georgia (four whaling stations) with South Orkney and South Sandwich and (2) South Shetland and Graham land. Area of colony 4,618 sq.mi.; pop. (1949) 2,267, almost all of British descent, mainly Protestant. Capital and only town Stanley (c. 1,200). Administration: governor; executive council; legislative council. Governor, Sir Miles Clifford.

History. A further measure of constitutional reform was in preparation at the end of 1951. The 1949 constitution provided for a legislative council of six unofficial members, four elected and two nominated, and six official members, the governor, as president having a casting vote. The casting vote had to be used too often, and it was proposed to provide for an unofficial majority by reducing the number of official members to five. The Colonial Development corporation's seal-oil project came into production during the year and the construction of the corporation's freezing plant at Port Stanley to handle 1,000 beef and 30,000 mutton carcasses a year was due to start production early in 1952.

Argentina maintained its claim to the Falklands and their dependencies at the Conference of American Foreign Ministers in Washington and sought to reinforce it by establishing another (and this time a naval) base in the dependencies. Chile also established a third base, and the British government continued to propose, without success, that the dispute be submitted to the International Court of Justice. The work of the Falkland Islands survey proceeded without interruption.

Education. 1 school in Stanley, 10 "settlement" schools on sheep ranches and travelling teachers; in 1948 total pupils 338.

Finance and Trade. Currency: sterling, with local notes. Budget (1950-51 est. for 15 mo.): *Colony*, revenue £194,000; expenditure £191,000; *Dependencies*, revenue £129,806; expenditure £102,864. Foreign trade (1950): imports £6,600,000; exports £6,200,000. Principal exports: wool, whale-oil. (K. G. B.)

See E. E. Hunter Christie, *The Antarctic Problem* (London, 1951).

FANFANI, AMINTORE, Italian politician and economist (b. Pieve San Stefano, Feb. 6, 1908), became in 1936 professor of economic history at the Catholic university of Milan. He published many books, including *Le origini dello spirito capitalistico in Italia* (Milan, 1933) and *Storia delle dottrine economiche* (Como, 1943-45); one of his books, *Catholicism, Protestantism and Capitalism*, appeared in English translation (London, 1939). After World War II he joined the Christian Democratic party, was elected, in June

1946, to the Constituent Assembly and, in April 1948, to the Chamber of Deputies. On June 1, 1947, he became minister of labour and social welfare and kept his portfolio in the fourth, fifth and sixth De Gasperi cabinets. In July 1948 he proposed a plan for the completion, within the following seven years, of some 300,000 much-needed houses for workers at a cost of L.350,000 million and the act was passed by the parliament in December of the same year. In Sept. 1949 he reported that L.20,000 million had been invested for the purpose. In Jan. 1950 Fanfani refused to join the seventh De Gasperi cabinet after the premier had declined to strengthen the Christian Democratic left-wing representation in the government. On July 26, 1951, he returned to power in the eighth De Gasperi cabinet as minister of agriculture and forests.

FASHION AND DRESS. During 1951, questions were posed about the waistline, which seemed likely to be answered in 1952. Several designers—but especially Dior—developed a whole series of devices for carrying the eye to a higher level. The natural waistline remained fitted, sometimes in an unbelted princess style, but attention was focused at a point several inches higher by means of short boleros, little rib-hugging spencers knotted between the breasts, high martingales, deep corselette belts and breast-high bows. These devices made clothes look longer, by altering the proportions; in point of fact skirts only lengthened in some houses by about an inch. Dior then asked us persuasively if we would like our waists to rise to Empire level. Balenciaga did just the opposite, offering us a midgy line, straight and loose through the waist, fitted round the hips. He tacitly inquired if we would like our waists to sink to the '20s level; but the '20s did not yet seem to have acquired sufficient distance to lend enchantment to the fashions with which they were associated.

Another move was towards something very like the famous postwar "New Look," though in a less exaggerated form. Some very wide skirts were seen, for tailored suits as well as for day and afternoon dresses—the width being achieved by all-round pleating or by flares, usually from a hip yoke. This fullness was emphasized by stiff crinoline petticoats, sometimes two or three at a time. It was significant that this fashion was first seen in ready-to-wear clothes in the United States and was only later reflected at the Paris couture collections. This was a topsy-turvy state of affairs, for fashion had, traditionally, begun at the top and percolated downward. But the fact was that in 1951, for a number of reasons, the U.S. was setting fashion in some fields; partly because some of the leading Paris houses had established ready-to-wear houses in New York which exercised considerable authority; partly because the U.S. clothing industry was geared to high-speed changes and needed to effect them faster than the rest of the world; and partly because there had come to be a definitely recognizable "American Look" which appealed to the young, especially, in other countries. The full skirts, for example, had great charm, and if they were only seen in England in limited numbers and in a modified form, it was because the price of fabrics made them cost more than most women could afford.

The designers poured all their ingenuity into sleeves in 1951. Shoulders were always smooth and sloping, but some sleeves swelled out to leg of mutton fullness, giving soft bulk just below the shoulders; others sprang out in stiff fans or tiered pagoda ruffles. Otherwise, classic suits had three-quarter bell sleeves, arc sleeves cut in a semi-circle with the inside seam much shorter than the outside, or ultra-long sleeves which covered a woman's hands—as if she were wearing her husband's pyjama jacket.

After years of tent coats there was a return of the redingote

Examples of Women's Fashions in 1951. (1) Stone llama wool coat with fur facing and fur muff of black Persian lamb by Hartnell. (2) Suit in speckled blond wool, with unpresed pleated skirt, relentlessly carved jacket with full diamond set sleeve, dominated by an

astrakhan jabot by Fath. (3) Dior strapless evening gown in creamy brown net; gilt crescent moons carry the eye to the bodice with its brown velvet ribbon bow.

—the fitted coat with flared skirt. And since this type of coat looked well over dresses rather than suits, there was also a great feeling for the coat-and-dress ensemble as an alternative to the suit. Tailored dresses in tweeds and worsteds were much seen, especially at the London collections; they suited English life and the chill of English houses. Fur trimmings came back in strength, Persian lamb and nutria being the favourites, with spectacular furs such as ocelot and civet cat used for muffs and linings.

The short décolleté dress, with cover-up jacket or bolero, established itself as the perfect answer to all those 6 o'clock-ward occasions that began with a cocktail party or theatre and finished with a restaurant dinner. They were made in velvet, satin, taffeta and metal-thread brocades. This type of dress, however, ended the attempt to meet the formal evening occasion. It was never popular in this role in England where women, when they "dress," like to do the thing in style and are romantics at heart. The shortest evening dresses in Paris were a few in the ballerina length, which had a young prettiness.

One welcome return for Englishwomen was the dinner dress—that covered-up type of dress, with skirt to the ankles or floor. In dark or rich colours, and often in fine woollen or jersey, it was an elegant comfortable dress for evenings at home. Another important evening trend was towards two or three subdued colours mixed and blended in one dress. After many seasons, shoulder straps began to reappear for full evening dress, sometimes one, sometimes two and sometimes with the variations of a halter neck or an off-shoulder neckline.

The great day-time fabric successes were the shaggy fleecy cloths, and curly poodle cloths for overcoats. Tweeds made a hit after some seasons of eclipse; coarse-grained tweeds and knobby Donegal tweeds were much seen. This feeling for marked texture was carried into the lighter-weight fabrics. Corded, ribbed surfaces were seen in woollens and worsteds; slub-weaves in silks and rayon. Shantung and dupion were summer favourites, and metal-thread fabrics were of special importance in late-day ensembles. Street velvet—a spot-proof cotton velvet—acquired great popularity; its practical virtues made it appropriate for suits and raincoats, and its handsome looks also caused it to be chosen for late-day dresses and coat-linings.

The most striking success among daytime colours was that of the dark greys (gunmetal and charcoal), which often replaced black, and there was a whole gamut of greens, from sage through emerald to dark fir. Blues, gradually returning to favour, scored successes principally in the turquoise and peacock ranges, and in royal blue teamed with black. Purple and lavender gained a limited popularity and reds had an undertone of blue rather than yellow. In the evening subdued greys, greens, yellows, purples and some orchid-pink were seen; there were few bright colours, but two or three different colours or tones were often used together, including some beautiful all-blue effects.

The summer's wide-brimmed, shallow-crowned hats became the winter's big formal hats for late-day, worn straight on the head. Daytime hats became small: tiny side-dipping caps, straight toques, bonnets curved over the brow. The smaller the hat, the bigger the jewel pinned into it.

Jewels, indeed, became bigger, but retained a lightness of workmanship which made them far removed from the chunkiness of prewar jewels. Pairs of brooches were worn high on one shoulder; or, with one on a shoulder, the other under the opposite breast. Huge single brooches were worn on the shoulder, at the waist, or pinned in the chignon—for, with the continuance of short hair styles, chignons were often added in the evening.

The most startling development in shoes were Dior's

pumps with inch-high Cuban heels, made by Perugia, for day and evening. At the other end of the scale were Fath's slender tapering heels, widening towards the base to the size of a sixpence.

An important event of 1951 was the re-entry of Italy as an influence in fashion. Long famous for her textiles, her leather accessories and the beauty and elegance of her women, Italy staged, in Florence, her first fashion shows combining designers from Rome, Florence, Milan and Turin. Their outstanding contribution was in the field of sportswear.

(A. Ws.)

Men's Fashions. Although the trend towards Edwardian styles, which was so apparent during 1950, continued to exert itself in 1951 in the more fashionable spheres, there was no appreciable large-scale following for the style from the wholesale trade or from the public generally. It is true that some of the features of the revived fashion, such as vents in the back of jackets, waistcoats in contrasting materials to suits, and the bowler hat, were more widely adopted, but the style as such was not.

In earlier years, innovations which aimed at novel and more colourful styles were regarded as "spivvy" and were boycotted by the average man. Quite a remarkable change in this respect was seen in 1951. There was a definite veering away from traditional conservatism in men's dress: not only were brighter ties, shirts and socks to be seen everywhere, but there was a widespread adoption of the suit with a mildly draped cut and long lapels.

While this minor style revolution was taking place in one section of the trade, the elaboration of the Edwardian theme continued in another. The stylists here favoured the longer single-breasted jacket, with centre-back vent, turned back cuffs and a ticket pocket, waistcoats with step collars and flaps on the lower pockets, and "drainpipe" trousers.

The highlight of a style exhibition staged in Edinburgh, in October, in connection with a joint conference of English and Scottish tailors' federations, was the return of the velvet collar on overcoats. One model featuring this revived embellishment had flapped breast pockets and outside ticket pockets, turned-back cuffs and a short centre-slit at the back. Another had a narrow edging of velvet to its turned back cuffs, as well as on the collar.

The roll-collar, single-breasted dinner jacket was much in evidence during 1951, but the double-breasted style remained more popular. A new version of the double-breasted jacket was flared and vented and had slant side pockets. White gloves were increasingly worn with full evening dress at receptions.

FEDERAL RESERVE SYSTEM. United States.

During 1951 the federal reserve system and the financing institutions of the nation worked out a voluntary credit restraint programme to curtail loans for non-essential purposes. Late in the year the federal open market committee greatly curtailed its support of the Treasury bill market in the face of strong money market pressures and forced banks to borrow if they wanted more funds. Early in December member bank borrowing set an 18-year record in reaching a level of almost \$1,000 million.

The Defence Production act amendments of 1951 reduced the administrative discretion of the board of governors in control of consumer credit. In accordance with this legislation, the board amended regulation W, effective July 31, so that (1) the maximum maturity applicable to instalment credit for motor cars, household appliances, radio and television sets and furniture was lengthened from 15 to 18 months, and for home repair and improvements from 30 to 36 months;

(2) the down payment requirements for household appliances and for radio and television sets were reduced from 25% to 15%; and (3) the down payments required by the regulation might be made in cash, trade-in or a combination of trade-in and cash.

Several changes were made during the year in the coverage and terms of regulation X relating to real estate construction credit. As from Jan. 12, the scope of the regulation was broadened by making it applicable to credit in connection with three- and four-unit residences and multi-unit residential property. On Feb. 15, the regulation was further broadened to include most new non-residential construction, with maximum loans on such structures limited to 50% of the value of the property, maturities limited to 25 years, and amortization required. From March 5, terms different from those prescribed by the regulation were permitted to apply to specific new construction necessary to the national defence. On Sept. 1, the regulation was amended so as to bring it into conformity with the provisions of the new Defence Housing and Community Facilities and Services act of 1951. This legislation provided, among other things, for (1) the suspension and relaxation of restrictions in critical defence housing areas; (2) minimum down payments for veterans' loans on houses having a sales price of less than \$12,000; and (3) maximum down payments in connection with conventional or Federal Housing authority financing of homes where the transaction price was \$12,000 or less.

A general increase in reserve requirements during January raised the required reserves of member banks by a total of about \$2,000 million and left reserve requirements at their existing statutory maximum levels except for an additional two percentage points against net demand deposits in central reserve city member banks. (J. K. L.)

FENCING. The world championships were held at Stockholm in May 1951 and produced very keen competition and the highest technical standard seen since World War II. France won the ladies' and men's foil team titles by narrow margins and fielded a young épée team which decisively beat their more experienced Italian and Swedish rivals. Illona Elek (Hungary), the 1936 and 1948 Olympic champion, won the ladies' individual title and Manlio di Rosa and Edoardo Mangiarotti of Italy won the men's foil and épée individuals respectively. Hungary made their first appearance in these championships since the war and, by winning both the sabre titles, showed that their supremacy at this weapon remained unimpaired. Aldar Gerevich, the 1948 Olympic sabre champion, won the individual title.

In Great Britain fencers once again increased in numbers and there was a further expansion in the county organization of the Amateur Fencing association, as well as in the number of holders of the leaders' (amateur instructors) certificate. The season was marked by a Festival of Britain International Open Foil competition which attracted entries from the leading British and European professors and amateurs. The final was held during a brilliant gala at the Chelsea town hall, London, in the presence of Princess Elizabeth and the Duke of Edinburgh. The competition was won by Jehan Buhan, the 1948 Olympic foil champion.

The British amateur champions were: Gillian Sheen (ladies' foil), H. Cooke (men's foil), A. E. Pelling (épée) and P. M. Turquet (sabre). (C.-L. de B.)

FERTILIZERS. The consumption of fertilizers in the United Kingdom fell slightly in 1950-51 as compared with the 1949-50 period. Both sets of figures were undoubtedly influenced, however, by an excess of buying prior to the removal of 50% of the fertilizer subsidy in July 1950 and its complete withdrawal in July 1951. Consequently, it was

not possible to say whether the upward trend in fertilizer consumption would persist (see Table I).

TABLE I. CONSUMPTION OF FERTILIZERS IN THE UNITED KINGDOM (in tons of plant food)

	Nitrogen (N)	Phosphoric Acid (P ₂ O ₅)	Potash (K ₂ O)
1939-40	77,100	195,500	85,000
1945-46	164,600	358,700	123,000
1947-48	185,000	396,400	179,800
1949-50	225,100	460,600	234,000
1950-51	216,000	423,000	226,000

With the final removal of the subsidy fertilizer prices rose steeply (see Table II). The price increases for phosphatic fertilizers in 1951 were considerably greater than in 1950, and were due not only to removal of the subsidy and to increased costs but also to a production charge on home-produced phosphatic fertilizers. These fertilizers were then sold at the same price as the imported materials. No maximum price was fixed for triple superphosphate, first produced in Great Britain in 1951.

TABLE II. FERTILIZER PRICES IN THE UNITED KINGDOM*

	June 1951			July 1951			% increase
	£	s.	d.	£	s.	d.	
Nitrate of Soda (16% N)	19	17	6	29	15	0	50
Sulphate of Ammonia (20.6% N)	13	1	6	15	3	6	16
Nitro-chalk (15.5% N)	12	13	0	14	11	0	15
Muriate of Potash (60% K ₂ O)	16	3	0	20	4	0	25
Sulphate of Potash (48% K ₂ O)	19	3	0	21	11	0	13
Basic Slag (15% P ₂ O ₅)	5	5	0	8	0	0	52
Superphosphate (18% P ₂ O ₅)	8	0	9	14	13	6	83
Ground rock phosphate (29% P ₂ O ₅)	7	1	9	12	2	0	71

* Prices per ton (including early delivery rebates where applicable) for six-ton lots delivered to nearest station; potash fertilizers quoted at importer's stores.

The fertilizer subsidy amounted to £9,200,000, as compared with £15 million in 1949-50. The U.K. would no longer have the same advantage as in 1949-50 regarding fertilizer costs compared with almost all European countries. The acreage grant, introduced in 1950 to encourage the use of fertilizers on grassland and rough grazing, was withdrawn in July 1951. The contribution of two-thirds towards the cost of fertilizers for such land on ploughing up was continued, the maximum grant being raised from £3 to £4 an ac.

Details were made known of findings from boreholes to the potash deposits in northeast Yorkshire and further developments were awaited with interest.

The shortage of sulphur (brimstone) exerted a world-wide influence on the fertilizer industry, the biggest consumer of sulphuric acid. Sulphuric acid, used especially in the manufacture of superphosphate and ammonium sulphate, is made chiefly from brimstone, supplies of which had latterly come almost entirely (e.g., in 1947, 92.5%) from the U.S. deposits in Louisiana and Texas. World demand for this sulphur had risen and, at the 1950 rate of consumption, it was estimated that supplies might be exhausted in 11 years. Consequently, exports were restricted in 1951 and supplies for home use reduced. In the United Kingdom, sulphuric acid for fertilizer manufacture was reduced to two-thirds of capacity and imports of superphosphate from Europe were increased. A new range of compound fertilizers containing more ground rock phosphate was introduced in July thus saving 15% in superphosphate content. New sulphuric acid plant, designed so that pyrites or anhydrite could be used instead of sulphur, was planned. The biological production of sulphur by sulphate-reducing organisms was also investigated.

The shortage of sulphur presented serious problems in Australia, New Zealand and South Africa, where superphosphate was very widely used. New Zealand and South Africa adopted the expedient of mixing superphosphate with fillers such as ground rock phosphate or ground serpentine rock. Australia, with extensive pyrites deposits, turned attention to their greater development.

In the United Kingdom, the National Agricultural Advisory service carried out further field trials on "nitro-phosphate," in the manufacture of which sulphuric acid was replaced or partly replaced by nitric acid in treatment of rock phosphate.

In Australia and New Zealand, aircraft were used more widely for fertilizer application (see *N.Z. Journ. of Agric.*, p. 315, 1951). In the U.S., aircraft were used in reforestation and distributed seed coated with fertilizer, insect repellent and fungicide. A commercial firm in the U.K. sprayed 1,000 ac. of marshland with a mixture of fertilizer and selective weed-killer.

More blower type distributors were used in New Zealand for top-dressing hill country. (e.g., see *N.Z. Journ. of Agric.*, p. 49, 1951.) (M. S. SH.)

FESTIVAL OF BRITAIN, 1951. In Dec. 1947 it was announced that the government had decided to mark the centenary of the Great Exhibition of 1851 by a nationwide celebration in the summer of 1951. The director general of the organization formed to plan and to implement the

festival projects was the author of the conception, Gerald Barry (*q.v.*), who was knighted in the 1951 Birthday Honours. For the earlier history of the Festival see also *Britannica Book of the Year 1951*.

To a gathering of heads of local government at the Guildhall, London, in June 1949, the king sent this message of good wishes:

"The Queen and I trust that every family in all parts of the country will share in this great Festival so that all of us may join in showing that Britain lives on, now as ever, taking her rightful place among the nations of the world."

It has to be admitted that the two preparatory years were plentifully strewn with lapses from this high idealism, though the Festival office worked strenuously and gallantly on. The festival became a subject on which feelings ran high in parliament and in the press. Probably a majority of the public had still to be convinced that the times were right for festival or that, if they were, the money was being spent in the right way. As the date of opening came nearer, criticism became concentrated on the South Bank and its complement of "fun and games" (to quote Gerald Barry's label) up river at the Battersea park pleasure gardens. Materials were short; more money had to be raised; labourers downed tools. Those who declared that even if the exhibition were eventually completed no-one would go joined pessimistic forces with others who believed there would be unparalleled scenes of congestion, preventing London from going about its everyday business. The international skies darkened; tourist agencies reported substantial cancellations, especially from the dollar areas. Yet these circumstances and conditions made all the more appropriate the words used by the king from the steps of St. Paul's cathedral after the service of dedication on May 3, 1951: when he had declared the festival open he described it as a "symbol of Britain's abiding courage and vitality."

South Bank Exhibition. The "national centrepiece" of the festival was confined to an area of 27 ac., bounded by Waterloo bridge, Waterloo station and County hall. Not the least of the achievements of Hugh Casson, the director of architecture, was a brilliant contrivance of spaciousness which prevented the visitor from feeling that he was being presented, as in fact he was, with a quart in a pint pot. The river assisted in the illusion, so did the skilful use of different levels in the pavilions, and the upthrust of the charmingly nonsensical Skylon and of the Shot Tower, an ancient landmark disguised as a lighthouse. The pavilions, most notably the Dome of Discovery with its 365-ft. span of aluminium supported only by steel girders, were, by general consent alike of the public and of such experts in modern architecture as Walter Gropius, considered to exploit with great effect the use of glass, steel and concrete. The prodigal use of colour externally was less universally approved at first but, it was agreed, improved upon acquaintance. There were few visitors who did not find enchantment at night in the lighting scheme. The only permanent building, the Royal Festival hall, gained few admirers of its exterior, but more, perhaps, of the concert hall itself, though controversy still continued at the end of the year about its acoustic quality.

The South Bank story was a narrative in three parts. In the upstream pavilions, the theme was "the Land of Britain"—an account of how the islands were formed, how agriculture made them fertile, how mineral resources were converted by industry into the implements of daily use and how these products in their great variety were distributed at home and overseas. Downstream, the theme was "the People of Britain." Here, the story was told of how their forebears came to the islands; how their evolving ideas, beliefs, traditions and eccentricities shaped their social history; how they now lived, designed their homes and

The scene outside St. Paul's cathedral, London, May 3, 1951, when King George VI officially opened the Festival of Britain.

The festival ship "Campania" arriving at Glasgow, Sept. 1951. The ship—a former aircraft carrier—was converted into a travelling exhibition which visited Southampton, Dundee, Newcastle-upon-Tyne, Hull, Plymouth, Bristol, Cardiff, Belfast, Birkenhead and Glasgow.

cultivated their gardens; how their schools were being made at once more efficient and more beautiful; how they contributed to medical science; how they evolved and played many of the world's popular sports; and how, as an island people, they made use, both for work and play, of their long coastline. The third part of the story was told in the Dome of Discovery, which housed the tale of Britain's contribution to the exploration of the earth's surface and the discovery of the minerals below that surface, and to meteorology, radio communication, astronomy, physics and biology.

If the application necessary to make a detailed journey from theme to theme was only to be found in a minority of the visitors, there were hundreds of thousands who found their greatest pleasure in the pavilion which dealt with the subject nearest to their own experience, and a very large number more who were content to wander idly past the "wave-making machine" or "watermobile," to sit on the little platforms which jugged out over the Thames, to sit startled in the cinema with its stereoscopic films or to watch a team of huskies pull a sledge over artificial ice. Complaints were most generally heard of the difficulty of understanding the exhibits in the Dome of Discovery, of the absence of any mention of the history of British arms, or of the British contributions to social sciences, and of the indifferent catering arrangements.

Attendance at the South Bank after a slow and anxious start, and despite poor weather, was in the end only half a million short of the 9 million estimated by the festival authorities. The main disappointments were the apparent poor attendance of foreign visitors and the poor numbers

after nightfall. The entrance fee after 9 p.m. was cut from four shillings to two, and this had an appreciable effect on the number of latecomers. Another attraction was the season tickets which, for 25s. a week or £4 a month, entitled the holder to admission to the South Kensington and Poplar exhibitions as well. There is little doubt that the South Bank made a profound impression on the foreigners who did come—a full coverage in the Scandinavian press brought last-minute visitors from those nearby countries. The busiest day of the whole exhibition was Saturday, Sept. 22, when there were 158,365 visitors.

On Saturday, Sept. 29, the day before the exhibition closed, vast crowds remained inside the grounds until closing time, dancing on the Fairway (the open space outside the Dome of Discovery) with searchlights for illumination and singing popular songs with Gracie Fields to lead them. The following night, the archbishop of Canterbury, in the absence of the king, broadcast a message, after which the massed bands, drums and pipes of the Brigade of Guards beat tattoo. Then came community singing and the impressive striking of flags, in darkness except for spotlights, from masts below the Skylon. The whole gathering joined in the singing of "Abide with Me," "Auld Lang Syne" and the national anthem, then dispersed in silence, leaving the exhibition buildings to the breakers, and the future of South Bank to the London County council and the government.

Exhibition of Science. The design of the Exhibition of Science was the work of a team of young scientists and mathematicians working under the general counsel of a committee of scientific "elder statesmen," and under the specific guidance

A view of the South Bank exhibition at night, from Waterloo Bridge on the left to County hall on the right—

of the festival's director of science, Ian Cox. It was housed on the ground floor of the new west wing of the Science museum, South Kensington, work on which was hastened to make it available in the summer of 1951. Insufficiently, and unimaginatively publicized, the exhibition attracted hardly more visitors during the whole five months during which it was open than did the South Bank exhibition on its most successful day. The South Kensington exhibition presented pure science, as opposed to its practical application, displayed in the Dome of Discovery. The story was told in three parts, these parts displaying, first, the physical and chemical nature of matter, second, the structure of living things, and third, under the title "Stop Press," the most recent topics of scientific research. A long hall was dominated by a vast, whirling diagram, setting out the elements kaleidoscopically. The entrance was a gigantic simulation of a lead pencil, and a voice persuaded the visitor he was that size. Soon, by cleverly arranged models, he found himself no bigger than a grain of graphite in the pencil. The scale was further diminished to that of the atom, until the spectator finally came face to face, on equal terms in point of size, with atomic patterns. The magnification at this point was 10,000 million times and disembodied voices invited the spectator to contemplate the architecture of crystals. The combination of a fairground assault on the emotions with an intellectual demand was daring and strikingly successful. From the caverns of the atom itself, the visitor passed to a brilliantly lit hall where diagrams and moving models displayed atoms in chemical reaction. The second part of the exhibition, making use of translucent models in vivid colours, showed how cells divide, specialize and reproduce, and how man's action can affect cell life. The secret of plant growth, and the relation of man to his plant and soil environment were revealed in the simplest of models and without the use of jargon. The captions, written by J. Bronowski, the well-known broadcaster, were a triumphant if rare example of the scientist's ability to describe his knowledge for the layman. The climax of the exhibition was an exhibit of cosmic rays, and a demonstration, rather like an indoor firework display, of the hypothesis that astronomical phenomena are part of a gigantic and eternal cycle.

Outside the main stream of the exhibition were a number of contributing displays and demonstrations. One was a chemical laboratory showing the methods and the pilot apparatus first used to produce the variant of vitamin B which is now believed to be a cure for pernicious anaemia. Another was a cinema whose programmes illustrated three

main applications of cinematography in science—as a research tool, as a method for teaching and as a medium through which the findings of science might be clearly shown to the public generally.

Exhibition of Architecture. The County of London plan, 1943, placed first among development works to be undertaken after World War II the reconstruction of an area of 1,500 ac. in eight boroughs, of which Poplar was one. Of the three neighbourhoods into which Poplar was divided, one of 124 ac. was named Lansbury, after the great humanitarian and Labour leader, and a quarter of Lansbury was completed for the festival, while building continued on the remaining three-quarters of the site (Lansbury as a whole was to be completed in 1955). The district completed for the festival lay north of the East India Dock road, a varied collection of domestic dwellings very much on traditional lines, built of honey-coloured London brick and very far from the modernistic conceptions of Le Corbusier, Walter Gropius or the architects of South Bank. Foreigners who visited the area strongly criticized the insistence on traditional design, and particularly the lowness of the buildings, one reason why only 9,500 people were eventually to be housed on the 124 ac. which before the war accommodated, albeit miserably, 22,500. Visitors were able to inspect the new houses, some of which were furnished with hire-purchase chairs, tables, beds and labour-saving devices obtainable at modest prices in the East End.

One school was already in use during the festival. Lightly constructed and informally planned, it was both handsome to look at and, clearly, agreeable to learn in. The marketplace and shopping centre seemed likely to provide a model for London development, since they were largely covered-in and confined to pedestrians, two amenities in which the capital had long lagged behind other British cities. A long-established street market was accommodated within the plan, new, hygienically enclosed and well-lit stalls being provided for the traders. Trinity Congregational church, built as a memorial to the work of William Dick, a former minister, seemed to be the most "modernistic" building in the area, with its bold use of colour and of glass and copper. Two church halls, one with a full stage, were incorporated in the general design.

Closely linked to the "live exhibition" was the festival's own series of exhibits, dealing with building research and town planning generally. The entrance to these temporary buildings was marked by a giant crane, the counterpart of the Skylon at South Bank. There were two pavilions, one

—Other landmarks are the shot tower, the Royal Festival hall, the Dome of Discovery, the Skylon and Hungerford bridge.

showing how science had contributed to more economical building, the other describing the efforts of contemporary planners to avoid the mistakes of earlier town-builders. Both were ingenious and themselves a pattern of good planning. The popular success of the exhibition was undoubtedly a villa called "Gremlin Grange," in which were graphically portrayed the mistakes of which builders of the past (including the most recent past) had been guilty. And the leg-weary and conscientious visitor, who might have come ill-prepared for the strenuous time which the complete tour of Lansbury involved, doubtless found rest and comfort in the new Festival inn.

Battersea Pleasure Gardens. After delays, labour troubles, controversial expenditure and a last-minute change of direction, not to mention a sea of mud due to the wet spring, the 37-ac. pleasure gardens and fun fair opened at the end of May instead of at the beginning of that month. They soon became very popular with the citizens of London, many of whom arrived by river. The "diversions," including the open-air and summer theatres, the beer and wine gardens, the grottos, the avenues of booths, the lake and the lighting, which were provided in the gardens proper, were as much liked for their unusualness, as was the fun fair (which, incidentally, opened on time) for its familiarity. The joint force of John Piper and Osbert Lancaster as designers of the Grand Vista produced some exotic constructions which not only charmed the eye, but also caused a good deal of amusement. Eight million people enjoyed the "Battersea Wonder," as it became known, between May and November, and not a few of them were delighted to learn later in the last month that the pleasure gardens would be open again in 1952.

Festival Ship "Campania." Starting at Southampton on May 4 and going by way of Dundee, Newcastle, Hull, Plymouth, Bristol, Cardiff, Belfast and Birkenhead to Glasgow, her last port of call in September, the converted aircraft carrier "Campania" (16,408 tons) carried the story of the South Bank in miniature to large sections of the population who were unable to make the journey to London. The number of visitors to the ship totalled 888,786, and if it had been possible to open the exhibition on Sundays, the million mark would certainly have been passed. From the point of view of attendance, this was therefore one of the most successful of the ancillary exhibitions, and there were those who, having been both to South Bank and aboard the Festival ship, declared the simpler and more compact exposition of the same theme to be found in the latter a more satisfying experience.

The Campania's hangar deck, 300 ft. long, was high enough for galleries to be built to increase the exhibition area. Visitors passed from this deck, with its galleries, to the flight deck, so that the studied changes of level, and the carefully contrived alternations of concealment and disclosure, which were characteristic of the South Bank exhibition, were also reproduced in the floating miniature. Conversion to an exhibition ship was planned by the director of naval construction, Sir Charles Lillicrap, and James Holland, one of the chief designers of the festival, and carried out by Cammell Laird. During her five months as Festival ship, "Campania" flew the red ensign and was manned by a merchant navy crew under Capt. F. S. Thornton. The festival staff and maintenance party occupied a hundred cabins. Perhaps the most effective section of the exhibition in "Campania" was that devoted to homes and gardens, where the solutions offered to the problems of using space economically and of saving time and labour gained emphasis from being housed in a ship, where room is always more constricted than it is ashore. Another detail of the exhibition which was much commented on was the striking series of pictorial panels, the work of Richard Negus and Philip Sharland, on the gallery deck, which portrayed the cycle of the British seasons. On the flight deck was an exhibition of small boats, and amidships a large covered space was used for entertainments and demonstrations. Throughout the summer, "Campania" herself was also on show and all her normal equipment on view to the public.

Land Travelling Exhibition. This, the largest travelling exhibition ever conceived, brought to four inland cities and centres of industry, Manchester, Leeds, Birmingham and Nottingham, a story closely related to that part of the South Bank exhibition which dealt with industrial design and production. It covered an area of 35,000 sq. ft., and the problem of transporting it was a formidable one. The time-schedule between showings in the four centres was tight, and three of the four buildings demanded some re-arrangement of the display units. The problem was ingeniously solved: the units were made as large as possible, to save time in re-erection, and were placed on adjustable footings to take up the varying levels of the four sites. Besides the units of the exhibition structure, 3,000 exhibits, ranging from aircraft engines to brooches, had to be dismantled, packed, crated and re-erected at each move. The whole exhibition was conveyed by road on 60-ft. trailers and in specially built vans, the largest four-wheeled vehicles permitted by the road transport regulations. Ten round

The South Bank exhibition of the Festival of Britain which told the story of British achievements. The exhibition covered an area of 27½ ac. and was open from May 3 to Sept. 30. (1) The interior of the Dome of Discovery, architect, R. Tubbs. (2) The Lion and the Unicorn pavilion, architects R. Y. Goodden and R. D. Russell. (3) A fountain designed by Richard Huws. (4) The monumental group "The Islanders" by Siegfried Charoux. (5) Some of the exhibits at the Sea and Ships pavilion, architects, Basil Spence and Partners.

trips by each of nearly 100 vehicles were necessary between sites.

The "shock tactics" of the designer, Richard Levin, an able exponent of the *avant-garde* in exhibition technique, began with the entrance foyer itself, which contained a remarkable sculpture by Fiore de Henriquez "portraying the skill of the British people," and with the Corridor of Time, where 40-ft. mirrors at each end, and 16 giant pendulums swinging overhead combined to symbolize, with dream-like effect, the endless progression of man and his skills. The corridor led to the arena, where the roof mosaic was carried out in the same style as the earlier sculptured displays and where a practical note was struck by the provision of an information desk and a special room for the answering of industrial enquiries. From the arena, entrances led to the five main sections of the exhibition, which dealt with discovery and design, people at home, people at play, people at work and people travelling.

Women visitors were especially interested in examples of how various things in everyday use in the home had developed and changed over the years. The altering shape and materials of such articles as the domestic iron, the child's drinking mug, the hot water bottle, the hairbrush, the pen, clothes pegs and spectacles were amusingly portrayed. Humour, indeed, was one of the outstanding features of the "land traveller" and was seen at its most popular in the representation of the Victorian parlour and its transformation into the "best room" of today. One of the most realizable of the ideals set forth by the designers was for comfortable and well-disposed bed-sitting rooms for the grown-up and the older child. Sport, which many people felt was inadequately dealt with at South Bank, was one of the most important sections of the travelling exhibition.

A theatre was included in the exhibition, and fashion shows given, not in the conventional way, but disguised as elaborate (and, again, amusing) mimes. "People at Work" struck a more serious note, with its emphasis on jet propulsion and the gas turbine engine and the development of production engineering techniques; but the last section, "People Travel," included such amusements as a full-scale model of a designer's idea for a passenger "lounge-car" of the railway of the future, and an inspired guess at the road car of the years to come. The vast majority of the exhibits in this and all other sections were not, however, imaginary prototypes, but articles in actual production.

Criticism of the exhibition as a whole tended to emphasize the absence of regional characteristics in what was shown. Something was done to counteract this by inviting the co-operation of local organizations in certain demonstrations. In Birmingham, for instance, members of the Royal Birmingham Society of Artists and Students of the College of Art painted pictures in full view of the public.

Exhibition of Industrial Power, Glasgow. The northern centrepiece of the Festival of Britain was the Exhibition of Industrial Power in the Kelvin hall, Glasgow. Princess Elizabeth performed the opening ceremony on May 28, declaring the choice of Glasgow to be "a well-deserved compliment to the land of so many engineers and inventors." The story of the exhibition began in the Hall of Power, where a blazing sun signified the source of all power, a vast sculptured mural by the Scottish artist, Tom Whalen, reaching from floor to roof in a giant black crescent hewn into forms and figures, represented coal, and 20,000 gal. of water breaking every minute on the roof of a brightly lit glass tunnel demonstrated hydro-electric power. From the Hall of Power staircases led to the detailed story of coal and water, which in turn joined again in the Hall of Shipbuilding and Railways. In the coal section a pit cage took visitors down to a "mine" in the alcoves of which were scenes of mines

at different periods. Though the exhibition as a whole had its grim and noisy side, it was not lacking in colour and delicacy, notably in a vast engineering mural which revived the 15th-century Venetian technique of covering tempera with an oil glaze, giving a luminous effect, and in a huge panorama of the Nile valley project. In the Hall of the Future stood a tall cone, ringed with wires, beneath a roof painted to represent a night sky. In the darkness a crackle would begin and a long, brilliant blue spark would jump to the ceiling and hang there, half-blinding and deafening the spectators—a dramatic symbol of power. The £200,000 Glasgow exhibition was the most poorly attended of any of the large exhibitions, the reason being advanced, too late for anything to be done about it, that Glasgow was the wrong city in which to mount a display, however impressive, of heavy engineering. The natives, being themselves too close to its subject, stayed away, and it was a long way for the casual traveller to go. The authorities had hoped for 25,000 visitors a day, but had to content themselves with a mere 5,000.

Farm and Factory Exhibition, Belfast. In June the queen opened the Ulster showpiece of the festival, which was housed in a new model factory on the government trading estate at Castlereagh, the grounds of which were laid out with temporary buildings and gardens. On the roof of the administrative block was a "vertical feature," a tapering metal tower, 50 ft. high, recalling in its design the Skylon of South Bank. The purpose of the exhibition was to trace the growth of the remarkable industrial tradition that had been built up in Ulster from so little, a tradition encompassing linen, shipbuilding, distilling, shirtmaking, tobacco, rope, pottery, aircraft and light engineering. Agriculture, however, as the largest industry, occupied one-third of the indoor display and two-thirds of the open-air display. The former showed the development since the 1870s of the land-tenure system, which had transformed the agricultural community from tenants into owners, and the development also of agricultural education. A section covering rural amenities showed the changes in the farmers' way of living in the previous 100 years. In the open air a replica of a farmhouse of 1851 was furnished with genuine pieces and tools of the period. Set beside it, and in astonishing contrast to it, was the "Ulster farm of the future," a 40-ac. working farm, with a grade A herd and incorporating every modern convenience, especially in the magnificent living-room which, like all the living accommodation, was set on the first floor. This living room, with an outside veranda or platform on two sides, was intended to be a conning-tower from which the farmer could watch all the operations on his land.

Within the factory building the main emphasis was on textiles. The Hall of Textiles indicated in graphic form the history of the manufacture of linen, its present-day production processes and the prospects for the future. The ten-year-old rayon industry was described, as was the hundred-year-old shirtmaking industry of Londonderry. The making of poplins, woollens and cottons was also described. The Hall of Industry drew special attention to the existence in Belfast of the largest single shipyard in the world, the largest ropeworks (developed in one man's lifetime), the Belleek works of fine china and pottery, and plants for processing tea.

A festival of the arts was mounted side-by-side with the industrial exhibition. Under the artistic direction of Tyrone Guthrie, a repertoire of Ulster plays was presented, some specially commissioned. An unusual contribution to the general scene of pageants and exhibitions was a cavalcade of nursing staged by the Royal College of Nursing in Belfast and produced and played entirely by nurses.

Liverpool Festival. In size and scope, this festival was next to London's. For three weeks, the ribbons decorating the

necks of the railway horses and the coloured sails which turned every lamp-post into a ship's mast, and the more solidly artistic achievements of opera companies, ballets and orchestras, gave to the city a cheerfully exhibitionist atmosphere. The character and aspirations of Liverpool were most originally presented in three gigantic processions, in which, on each occasion, 10,000 persons, with a choir of 2,000 voices, were engaged. The theme of the first of the spectacles was "Merseyside and Youth," of the second, fittingly for so great a port, "Merseyside and the World," and of the third "Resurgence," a declaration of faith in the city's future.

Small craft of the Royal Navy and the merchant navy gave remarkable demonstrations on the Mersey of skill and control in handling and manoeuvre; these were followed by rocket-laden barges converging from both sides of the harbourage and meeting to discharge their fireworks in a sky show on a scale never before attempted in the British Isles. The present-day industry of Liverpool was displayed with models and machines in Lord street, its past in Exchange station, where old locomotives were on view, and the classical bulk of St. George's hall housed a conspectus of the history of the area from the earliest riverside settlements. After ten years of occupation by the government, the Walker Art gallery had been transformed almost beyond recognition, with rooms re-designed and fluorescent lighting installed. Collections bequeathed by Liverpool benefactors were added to by loan or purchase. This was one of the outstanding art events of the Festival year—and an appropriate one for a city which had produced George Stubbs (whose work had a showing of its own), Augustus John, Wilson Steer and Walter Richard Sickert. The local school of architecture also staged a notable exhibition.

Orchestras which played included the Liverpool Phil-

harmonic, the Royal Philharmonic, the London Philharmonic, the Hallé and the Boyd Neel; conductors included Leopold Stokowski and Sir Thomas Beecham. In the course of the concert schedule the works of 16 British composers were presented. The Covent Garden Opera company visited the city, with Kirsten Flagstad (as Isolde) among its stars. The English Opera group presented a new production of *The Bohemian Girl*. The Sadler's Wells ballet came north for a fortnight. The famous Liverpool Playhouse staged plays both new and old, and the Old Vic company produced *Henry V* there. On this programme as a whole the city spent £75,000, the equivalent of a threepenny rate.

The Festival in Wales. Appropriately, Wales celebrated the Festival of Britain with song, both national and international. The eisteddfod at Llanrwst, Denbighshire, honoured a literature older than any in Europe save the Greek and Roman, and for one week Llangollen became a concert hall and a dancing platform for the world. Many teams—one from as far afield as Turkey—each in its national costume, competed in the international eisteddfod, giving informal folk-songs and dances in the village streets as well as in the giant marquee holding 10,000 people. Swansea also mounted a festival of music, which attracted the people from the "singing valleys" behind. St. David's cathedral, at the westernmost tip of Wales, one of the earliest foundations of Christendom, was the setting for a Festival of Worship. For four days in July there were special services conducted and sung with full cathedral ceremonial, a rare event in a country where the episcopal church is disestablished and the majority of the inhabitants "chapelgoers." Choirs were drawn from churches and colleges in Llandaff, Monmouth and Carmarthen, and among the orchestras heard were the B.B.C. Welsh orchestra and the Boyd Neel. The programme included a new work by Arwel Hughes, cantatas

An aerial view of the festival pleasure gardens at Battersea Park, London, which were open from May to Nov. 1951. The sun fair can be seen in the right background and the pier for river steamers in the left background. The white semi-circular area in the foreground was the main restaurant.

The Bath Bach choir giving a concert at the Roman baths during the 1951 Bath assembly (May 20-June 2).

and the B Minor Mass of Bach and very early church music. A Welsh play and an English one, specially commissioned for the festival, were presented on the altar steps, the first on the life of St. David, the second on Giraldus Cambrensis, the historian, who was closely associated with the cathedral.

A unique Welsh contribution to the Festival of Britain was a hill farm improvement scheme at Dolhendre, near Lake Bala, which was opened in June by the Minister of Agriculture. Sixty square miles of the Glanllyn estate had been transferred to the government in satisfaction of death duties in 1948, and were the largest area of publicly owned farmland in the British Isles. Three typically impoverished farms in these uplands were chosen for rehabilitation. They were sufficiently compact to be dealt with as a unit. The capital equipment came from the landlords, and the farmers assisted with draining, fencing and re-seeding. Derelict buildings were demolished and replaced by a model block, including dairies and calf-rearing sheds. Elsewhere buildings were repaired as well as new ones built. Peaty fields were re-seeded, pasture limed and oats sown where before were detached sheep walks. All these farmhouses were given modern cooking-ranges, electricity from private generating plants, a piped water supply and indoor lavatories and bathrooms. The Forestry commission played its part in the scheme by preparing and re-planting two belts of woodland with hard woods and conifers. The Festival plan, which laid open to inspection these farms and lands throughout the summer, was itself only a part of the larger development scheme which was announced as aiming at similar improvements for 80 of the 138 farms on the estate within the next few years.

Envoi. By the end of the year, though only the lights of the Royal Festival hall remained to illumine a South Bank that had returned to gloomy anonymity, and though the great exhibitions up and down the country had been dismantled and many a building became its prosaic self again, there were nevertheless a number of permanent reminders of Festival year and its achievements. The "tidying up" of both urban and rural areas seemed likely to produce lasting results, though the first reaction to this suggestion from the Festival office had been one of resentment. All in all, however, the people of Britain had reason to be satisfied with their "act of national autobiography"; they had had their "fun and games" and had demonstrated not unworthily the description of them given by the archbishop of York at the service in Liverpool cathedral which opened the

festival there: "We have," he said, "inventive genius, a surpassing gift of poetry, a deep respect for honesty and thoughtfulness, a natural kindness and humour, combined with a spirit of adventure and courage." (K. AM.)

FESTIVALS. Though in their several ways they enriched the Festival of Britain scene, the well-established summer festivals stuck close to their proven formulae in 1951, and tended to rely for patronage on the type of visitor which had been drawn to them in previous years. Stratford-on-Avon opened its season in chill March weather, its theatre having been redecorated, and reconstructed so as to bridge the gulf that had separated audience and players and, incidentally, to provide 135 more seats. A sequence of Shakespeare's historical plays, *Richard II*, *Henry IV, Part I* and *Henry IV, Part II*, and *Henry V*, was the main offering of a distinguished company which included Michael Redgrave, Hugh Griffith, Richard Burton (a young actor from Wales who made a profound impression) and Anthony Quayle, who was again the director of the festival. The intention was to emphasize the continuity of Shakespeare's philosophical and political thought on kingship. Many critics, while applauding the conscientious approach to this historical cycle, found magic only in the production of *The Tempest* and in Redgrave's performance as Prospero, generally agreed to have been superb. The Bath assembly was next on the calendar; the assembly also suffered from bad weather (and, in outside events, from bad sound-amplification). The outstanding contribution to a miscellaneous programme was a new ballet, *Fate's Revenge*, based on a local satire of an ambitious dancing-master, danced by the Ballet Rambert, for which David Paltenghi was choreographer. The Aldeburgh festival, in June, displayed even more noticeably than in previous years the special tastes of Benjamin Britten and his friends. The pattern of the entertainment therefore had a unity which was much to the liking of a mainly upper-class audience, augmented, on the open occasions, by the townsfolk, taking a pride in the accomplishment of their talented son. Choral performances, by local choirs, ranged from Handel's last oratorio, *Jephtha*, to Britten's own *Albert Herring* and *Saint Nicolas*. Britten himself displayed his versatility as a performer in Mozart's *Miniature Concerto for Glass Harmonica* (played on the dulcitone) and, on the pianoforte, the same composer's *F Major Concerto*. Local associations being a characteristic of this festival, madrigals and original music were given in

the panelled dining-hall at Brandeston, 17 mi. from Aldeburgh, and a new Britten work for solo oboe from a punt on Thorpeness mere. However, the most original contribution was perhaps that of E. M. Forster, who read for the first, and it was understood last, time extracts from his novel *Arctic Summer* which was not to be finished or published.

Cheltenham, in July, once more devoting itself to contemporary music, notably presented, through the Hallé orchestra, symphonies by the British composers Maurice Jacobsen, Malcolm Arnold and John Gardner, and the South African Arnold van Wyk. Of these, Gardner's was hailed as one of the most remarkable first works for many years, its craftsmanship and power of musical invention suggesting the maturity of a master. The English Opera group performed two new operas, Gustav Holst's *The Wandering Scholar* and Brian Easdale's *The Sleeping Children*. Unhappily the future of the Cheltenham festival in its existing form was stated to be uncertain. The Edinburgh festival, an openly declared international event, went its own majestic way in 1951. The artistic triumphs belonged mainly to foreign artists: to Bruno Walter, "one of the supreme interpretative artists of our age" (as he was described when presented for an honorary doctorate of music at the University of Edinburgh), and Dimitri Mitropoulos, and to the New York Philharmonic orchestra which they conducted on its first visit to Great Britain for 20 years; to the Théâtre de l'Atelier, in their production of two plays by Jean Anouilh; to the Yugoslav ballet; and to the Dutch documentary films. A new symphony by William Wordsworth was, however, given a good reception when played by the London Philharmonic orchestra under Sir Adrian Boult, and the Hallé orchestra with Sir John Barbirolli brought the festival to a fitting and dramatic close in a performance, by candlelight, of Haydn's *Farewell Symphony*. Subsidiary displays of art, books, heraldry, pottery, net-making, spinning and handweaving, and new plays put on by enterprising companies outside the festival proper, maintained the Scottish tradition which might otherwise have been overlaid. (See also Music.) (K. AM.)

FIELD SPORTS. A harsh winter and a long, cold spring in 1951 left their mark on all forms of field sport. Hunting was interrupted for weeks at a time and even when hounds and horses could go out the weather was often wet, cold or frosty; there was some foot-and-mouth disease and more than one outbreak of distemper and hard pad. Yet the level of sport was surprisingly high, and several outstanding days were enjoyed in all parts of the country. The number of foxes accounted for by many packs was the highest since World War II. In the shires, scent, save with the Cottesmore, was not good. In the north of England the weather was consistently bad, and perpetual snow and ice in the Lake district made fell hunting extremely dangerous. Sport in the south, the west and in Wales was generally good, and many excellent days were enjoyed in Ireland, despite only fair scenting conditions. Nevertheless, most hunts had more followers and children turned out in strength during the school holidays. Harriers and beagles experienced conditions similar to the foxhounds, and in the 1950 otterhunting season, though there was much good sport, heavy rainfall often resulted in there being too much water.

Shooting also suffered, for after the hard winter of 1950-51 and a late and difficult nesting season, grouse were backward, and in Yorkshire, especially, bags were disappointing. A few cases of disease were observed. On a number of moors the heather crop was inferior, although it was reported to be good in the north of Scotland. A notable feature of the 1951 season was a record bag of ptarmigan, 134 being shot in one day at Coignafearn, Inverness-shire, by six guns. The

John Peel's hunting horn held by W. N. Johns-Powell of Cardiff who bought it for £600 at an auction at Sotheby's, London, in Dec. 1951.

previous record for one day was 122 to one gun in 1886. Partridges were generally fewer than in 1950, being patchy but improving in northern England and southern Scotland, and although a few more pheasants were reared many coverts were still not properly stocked.

Among salmon and trout anglers, early hopes were dashed as the spring developed into one of the worst on record. Low water temperatures discouraged salmon from running and hatches of fly were scarce in most trout streams. Summer brought a change, but not always for the better, since rivers became rapidly low and foul and, in some, many fish died. Although the end of the season brought a period of pleasant weather, it came too late to save the season, which ended early nearly everywhere. (See also ANGLING.) (W. Ss.)

FIJI. British colony. About 250 islands, rocks and reefs in the Pacific ocean, the main islands being Viti Levu (4,011 sq.mi.) and Vanua Levu (2,137 sq.mi.). Pop.: (1946 census) 259,638; (1948 est.) 284,955, incl. 126,650 Fijians, 133,941 Indians and 6,126 Europeans. Religion: Fijians are Christian (mainly Methodist); Indians, 88% Hindu and 12% Moslem. Capital: Suva, on Viti Levu (European pop. 2,266 in 1946). Administration: governor; executive council; legislative council. Governor, Sir Leslie Brian Freeston.

History. John Dugdale, minister of state for the colonies, visited Fiji during Aug. 1951. While he was there it was announced that the arrangement by which the governorship of Fiji and the high commissionership of the western Pacific had generally been held by one individual would not be continued after the next change of governor. The headquarters of the high commission were expected to move, when that change took place, from Suva to Honiara, in the Solomon islands. Later it was announced that Sir Brian

Freeston, the governor, was to be appointed secretary-general of the South Pacific commission.

Fijian soldiers had played a fine part in World War II in the Pacific and in October it was announced that the 1st battalion, the Fiji Infantry regiment would go to Malaya early in 1952 to help with the war against the Communist terrorists. The colony's development plan and a community development project progressed well, and high prices for raw materials ensured continued prosperity.

Education. Schools (1949): 427 primary (48,000 pupils), 2 secondary, 2 technical (2,000 pupils); teacher training college and central medical school.

Finance and Trade. Currency: the Fiji pound (£F 111 = £100 sterling). Budget (1951 est.): revenue £3,250,000; expenditure £3,400,000. Foreign trade (1950): imports £6,300,000; exports £7,700,000. Principal exports: coconut products, gold, silver. Production (1950): rice 24,000 tons; sugar 116,000 tons; coconuts 28,000 tons; gold 103,000 oz.; silver 38,000 oz. (K. G. B.)

FINLAND. Republic of northeastern Europe bounded N. by Norway, E. by the U.S.S.R., S. by the Gulf of Finland and W. by the Gulf of Bothnia and Sweden. Area: 130,161 sq.mi., including Ahvenanmaa or Åland Islands (581 sq.mi.) and inland waters (12,190 sq.mi.) but excluding territory ceded or leased to the U.S.S.R. in 1944. Pop.: (1940 census) 3,710,800; (Jan. 1951 est.) 4,076,000. Language (1940 census): Finnish 3,327,534 (87·5%), Swedish 353,985 (9·3%), Russian 7,210, Lappish 2,345. Religion: Lutheran 96%, Greek Orthodox 1·8%, other 2·2%. Chief towns (Jan. 1951 est.): Helsinki or Helsingfors (cap. 376,000); Turku or Åbo (104,000); Tampere or Tammerfors (103,000). President, Juho Kusti Paasikivi; prime minister, Urho Kaleva Kekkonen.

History. By the beginning of the year 1951 it was obvious that the inflation from which Finland was suffering could be checked only by agreement between workers in town and country. The government led by Kekkonen, the leader of the Agrarian party, was a minority government consisting of Agrarians together with a few members of the small Swedish and Progressive parties and was unable to command the agreement of the town workers. In January Kekkonen came to terms with the Social Democratic party and widened his government into a four-party coalition: it now included 7 Agrarians, 7 Social Democrats, 2 representatives of the Swedish party and 2 Progressives. This meant risking difficulties with the Soviet Union (*Pravda* was castigating the Social Democrats as "paid agents of the Anglo-American warmongers") but was a necessary first step towards dealing with the economic situation.

The second step was to obtain agreement between employers, trade unions and farmers for an "economic truce." Agreement was reached on May 2 for a truce to last until Sept. 30: during these five months the trade unions would not press for wage increases and the employers and farmers would call a halt to the rise in prices. Meanwhile the government would set up a special committee to draw up a long-term programme for economic stabilization.

In mid-summer the progress of economic planning was held up by preparations for a general election. The results of the July election were as follows: the Social Democratic party won 53 seats (as against 54 in the 1948 elections), the Agrarian party 51 (56), the S.K.D.L. (Communists and fellow-travellers) 43 (38), the National Union (Conservative) party 28 (33), the Swedish People's party 15 (14) and the new Liberal party 10 (5 seats had been won in 1948 by the Progressive party, dissolved in 1951).

There was nothing striking about these results. The Communists had won five more seats, but their increase in votes had been very slight. All the other parties had been weakened by abstentions: only 73% of the electorate voted in 1951, whereas nearly 80% had gone to the polls in 1948. (See ELECTIONS.) The Communist gains were mostly in the

sparsely-inhabited north; in several southern constituencies they lost, particularly in Uusimaa, where Väinö Tanner was standing. Tanner, the Social Democratic leader who was foreign minister during the last war against the Soviet Union, and who had been tried and sentenced in a Finnish court on Soviet insistence, had now completed his prison sentence; he was returned to parliament with a large majority.

The Communists were vociferous in demanding seats in the new government, but in September Kekkonen reformed his ministry on much the same lines as before. Again it included 7 Agrarians and 7 Social Democrats. The only notable change was the appointment as foreign minister of a non-party man, the comparatively young and vigorous Sakari Tuomioja who had been managing director of the Bank of Finland.

When autumn came Finland's preoccupation was again with economic planning. The special committee announced its programme for stabilization. The proposal of most interest to the ordinary people was that a new cost of living index be drawn up on a basis which would not include income taxes or family allowances and that wages should be based on this index of October prices, which would be adjustable at intervals of three months. Meanwhile an attempt to reduce prices was made, beginning with a government decision to reduce textile prices by 20% and those of footwear by 15%. Butter, the consumption of which had been increasing in spite of soaring prices, was put on a ration of 6 kg. per person per month.

Whether the attempt to stop wage increases would succeed or fail depended largely on whether Communist influence in the trade unions could be arrested. In the trade union elections of April they won 90,000 of the 200,000 votes, but they were still only a small minority in the Finnish Trade Union congress which in July decided by 146 votes to 63 to

The body of Marshal Mannerheim (1867-Jan. 27, 1951) lying in state in the Great Church, Helsinki. He was president of Finland, 1944-46.

resign from the Communist-controlled World Federation of Trade Unions.

Relations between Finland and the Soviet Union remained harmonious throughout 1951, in spite of attacks in the Moscow press. Announcing its programme on Sept. 21, the new government declared:

The government will, like its predecessors, take particular care to keep up and extend the relations of confidence between Finland and the Soviet Union on the basis of the peace treaty, the Finno-Soviet pact of friendship and mutual assistance and the five-year trade treaty. Thereby the government wishes to keep Finland outside all conflicts between the great powers.

A difficult situation arose over the question of a new autonomy act for Ahvenanmaa (the Åland islands). The Soviet press attacked the proposed increase of autonomy on the far-fetched ground that Finland wanted the Ålands to share the fate of Greenland and Iceland, but the Finnish parliament passed the bill with little modification and the islanders, most of whom are Swedes, thereby received a greater degree of control over their own affairs, for which they had been asking continuously since 1946.

On the whole 1951 was a good year for most Finns. The long-term economic prospect might be alarming, but the immediate situation was eased by the fortunate fact of boom prices for Finland's exports. (J. H. JN.)

Education. Schools (1950): elementary 6,108, pupils 481,468; secondary 336, pupils 91,677, teachers 5,417; technical, commercial and special (1949) 458, pupils 24,578; for adults (1949) 76, pupils 3,993, teachers 707. Teachers' training colleges (1950) 9, pupils 1,597, teachers 118. Universities (1950) 3, students 9,440, professors and lecturers 632. Institutions of higher education 5, students 3,528, professors and lecturers 403.

Agriculture. Main crops ('000 metric tons, 1949; 1950 in brackets): wheat 323 (291); rye 218 (254); barley 181 (187); oats 723 (722); sugar, raw value 23 (26); potatoes 1,157 (1,210); flax fibre 3 (1). Livestock ('000 head, June 1950): cattle 1,844; sheep 1,330; pigs 470; horses 382. Fisheries: total catch (metric tons, 1948; 1949 in brackets): 46,100 (65,700).

Industry. Industrial establishments (1947): 5,999; persons employed 249,936. Electricity production (million kwh., 1950; 1951, six months, in brackets): 4,164 (2,250). Raw materials ('000 metric tons, 1950): pig iron 64.3; crude steel 112.4; copper, smelter production 1.75. Forest products (1949; 1950 in brackets): sawn softwood ('000 standards) 850 (875); sawn hardwood ('000 cu. m.) 51.4 (46.7); pitprops ('000 cu. m.) 1,134 (869); plywood ('000 cu. m.) 231 (215); cellulose ('000 metric tons) 1,015, (1,194); mechanical pulp ('000 metric tons) 598 (719); newsprint ('000 metric tons) 384 (421); other paper and paper board ('000 metric tons) 287 (350).

Foreign Trade. (Million markkaa, 1950; 1951, six months, in brackets); imports 89,112 (62,479); exports 81,420 (64,769), excluding reparations 7,850 (5,950). Main sources of imports (1950): U.K. 16%; Poland 7%; Netherlands 7%; Denmark 7%. Main destinations of exports: U.K. 20%; U.S.S.R. 16%; U.S. 9%; Netherlands 7%. Main imports (1949): metals and manufactures 18%; textiles 18%; fuel and oils 9%; machinery and apparatus 8%. Main exports: wood and wooden goods 47%; woodpulp 22%; cardboard and paper 19%.

Transport and Communications. Roads (1950): 36,518 mi. Motor vehicles licensed (Dec. 1950): cars 26,780, commercial 34,469. Railways (1950): 3,533 mi.; passengers 43 million; goods net ton-mi. 2,120 million. Shipping (vessels of 100 gross tons and over, July 1950): 335; gross tonnage 514,751. Air transport (1950): passenger-mi. 16.6 million; cargo net ton-mi. 335,000. Telephones (1950): 313,975. Wireless licences (1950): 721,500.

Finance and Banking. (Million markkaa) Budget: (1950 est.) revenue 134,800, expenditure 127,800. National debt (Dec. 1950; May 1951 in brackets): 122,100 (115,400). Currency circulation (Sept. 1950; Sept. 1951 in brackets): 34,500 (42,800). Gold and foreign exchange (million U.S. dollars, Sept. 1950; Sept. 1951 in brackets): 73.4 (165.5). Bank deposits (Sept. 1950; Sept. 1951 in brackets): 30,000 (34,200). Monetary unit: *markka* with an exchange rate of Fmk. 645 to the pound and Fmk. 231 to the U.S. dollar.

FISHERIES. The year 1951 saw, in the fisheries, a continuation of the trends of 1950 and was not marked by any particularly outstanding events. The problems of the major established fisheries were chiefly economic, in some cases aggravated by overfishing. Costs of gear and of operating fishing vessels increased and the building of large long-range trawlers continued. In the under-exploited fishing areas

development schemes were drawn up and some put into effect.

World Production. The publication of *Yearbook of Fisheries Statistics 1948-49* (Rome, 1950) by the Food and Agriculture organization of the United Nations (F.A.O.) marked great progress in the collection, compilation and presentation of statistics relating to fisheries production, trade and the utilization of fishery products; it became generally obtainable in 1951 and contained information available as of April 1, 1950. Only the more advanced publications concerning certain countries' fishing activities in the year 1950 were available at the end of 1951 so that world production in 1951 could not then be assessed. Even as late as in 1951 in many parts of the world where fishing was actively carried on, no statistics were compiled and the countries that did publish records did not compile them on a uniform plan. The F.A.O. yearbook brought together for the first time, in a standardized form and with standardized units, the compiled statistics of all the nations that had published them and included fairly reliable estimates of the fisheries production in those countries not publishing statistics. In the absence of other evidence the admittedly non-too-reliable estimates of world production at about 17 million metric tons in 1938, made by the United States Department of the Interior and F.A.O., had been generally accepted and it was assumed that by 1949 the annual postwar production was not greatly different to that of the immediately prewar years. The accompanying table, taken from *Yearbook of Fisheries Statistics 1948-49*, shows that, on revision, the figure for world total fisheries production was increased considerably to 25 million metric tons. The current F.A.O. estimates refer generally to the catch on a round fresh weight basis whereby fresh unutilized fish and dried or otherwise processed fish could be included together.

WORLD FISH LANDINGS
(Estimated annual totals, metric tons)

Continent	F.A.O.		
	Interim Estimate 1929-39	Current F.A.O. estimate Accounted 1945-49	Revised 1945-49
Africa	179,000	532,700	600,000
N. and Central America	2,690,500	3,692,500	3,750,000
South America	212,500	426,400	500,000
Asia (excl. U.S.S.R.)	7,237,800	10,975,800	12,000,000
Europe (excl. U.S.S.R.)	4,750,300	5,908,800	6,000,000
Oceania	56,200	96,200	150,000
U.S.S.R.	1,556,700	1,560,000	2,000,000
World Total	16,683,000	23,192,400	25,000,000

SOURCE. *Yearbook of Fisheries Statistics 1948-49* (F.A.O., Rome, 1951).

In earlier years fisheries production in any one country did not usually show sudden considerable changes from year to year unless the normal operation of that country's fishing industry was affected by war or unless some major natural catastrophe befell the fish stocks; thus the figures for production in various countries in 1949 given in the F.A.O. yearbook were an indication of the relative importance of the fisheries of individual countries. Japan, producing almost 3 million metric tons of fish, was the premier fishing country in 1949 despite the restrictions upon the range of her fleets' activities, and there was no evidence to suggest that Japanese catches in the two succeeding years were either reduced or superseded by those of another nation. In 1949, the other major fish producing countries were, with their yields in order of magnitude, the United States 2,546,500 metric tons, China an estimated 2,500,000, the U.S.S.R. an estimated 2 million, Norway 1,165,700, Great Britain 1,152,400 and Canada and Newfoundland 870,400 metric tons. It was interesting to note that the pre-World War II landings in northern Korea were estimated at 1,300,000 metric tons; the figure for 1951 must have been considerably lower because of the Korean war.

The *Yearbook of Fisheries Statistics 1948-49* also contained a table illustrating the annual average consumption of fish per head throughout the world. The highest consumption (over 20 kg.) was in southeast Asia (Japan and Burma) and in northern Europe (Iceland, Norway and Sweden); between 10 kg. and 20 kg. a head a year was consumed in other countries of southeast Asia, the other northwest European countries including Great Britain and in the West Indies; in the United States, Canada, Ceylon, China, Australia, New Zealand and France consumption was between 5 kg. and 10 kg. per head; it was less than 5 kg. per head in most parts of Africa including the Union of South Africa, central America, central Europe, the principal countries of South America and in India and Pakistan.

Although the U.S. catch of fish in 1949 was not far short of the Japanese, the amount of it utilized as fresh was only about half of the quantity utilized fresh in both Japan and Great Britain, but the amount of fish canned, frozen or reduced to meal and oil in the United States was far larger than in any other country in the world. The United States and Norway produced 49,600 and 26,600 metric tons of herring oil respectively, while of cod-liver oil the United Kingdom produced 10,000, Iceland 8,500, Norway 7,800 and Newfoundland 3,654 metric tons. The figures for 1951 were not widely different.

Great Britain. The demand for fish in Great Britain, stimulated by the rationing of meat, was fairly keen throughout 1951. The prices paid for fish maintained a comparatively steady level after the rapid fluctuations following the dropping of price control in 1950 and were appreciably higher than in 1949. The subsidizing by the government of the catching of fish in inshore, near and mid-waters, started in 1950 as a temporary measure, was continued throughout 1951. The total quantity of wet fish landed in Great Britain in 1951 was

17,726,000 cwt., worth £35,704,000, as compared with 17,654,000 cwt., worth £35,702,000, in 1950. The near-water trawling grounds, especially the North sea, continued to show all the signs of being overfished. More than usual of the bigger long-range trawlers fished at Iceland and Greenland where they made good catches. The spring and summer herring fisheries, chiefly in Scotland and northern England, yielded 391,500 crans, worth £1,500,000, the quantity being similar to that in 1950 but the value being up by about £300,000. The East Anglian herring took part as in 1950, and in October and November the landings at Yarmouth and Lowestoft totalled 302,000 crans, worth £1,092,000—that is 30,000 crans less fish realized £80,000 more than in 1950. In the course of the season one drifter made the highest single night's catch (303½ crans) since records were kept. An event which may have been of great significance was the re-opening, on a small scale, of the Soviet market for British cured herring; it was the decline of that market after World War I which caused a great decline in the British herring fisheries.

The construction of 41 trawlers in British shipyards for British owners was either in hand or had been licensed in September; of those 20 were near-water vessels and 21 distant-water vessels of over 140 ft. in length. All the near-water and seven of the larger trawlers were diesel-powered.

The Sea Fish Industry bill was introduced in parliament in January. It was summarized as "a bill to make provision for the re-organization, development and regulation of the white fish industry; to amend the law relating to fishery harbours, the catching and landing of sea fish and other matters affecting or connected with the sea fishing industry; to abolish the Scottish Fishery Advisory council; and for purposes connected therewith." An advisory council which the bill provided for to assist the White Fish authority was

Herring drifters seen at Lowestoft in Oct. 1951 during the herring fishing season.

later set up. A herring industry scheme was also drawn up to give additional powers to, without altering the constitution of, the Herring Industry board.

Norway. The two main Norwegian fisheries, those in the winter and early spring for herring and cod, were both outstandingly successful in the season 1950-51. The herring fishery on the west coast yielded over 9 million hectolitres worth Kr. 145 million, as compared with the previous record year of 1948 when 8,800,000 hectolitres were landed: some 7 million hectolitres of the catch was processed to meal and oil. The quantity of cod caught by mid-April was 115,339 metric tons, as compared with 71,839 metric tons in 1950. The cod fishery had previously been almost exclusively a line fishery, but in 1951 purse-seines, operated extensively for the first time, accounted for a large proportion of the total catch.

United States. Preliminary figures for the total catch of Pacific sardines in the 1950-51 season gave the total as 317,530 short tons, which was rather less than the previous season but about double that of the 1948-49 season. Thus the recovery of the fishery after its failure in 1947-48 was not maintained. The first progress report on the scientific investigations into the sardine fishery did not suggest any reason for the fluctuations. Meanwhile the tuna fishery was expanding, the yields for 1948, 1949 and 1950 being 156,000, 160,000 and 191,000 short tons respectively; the amount of the catch canned increased annually.

Iceland. The trawler-building contract between Iceland and Great Britain was fulfilled during the year, bringing the strength of the Icelandic trawler fleet up to 43 postwar and 16 older vessels. The trawlers caught large quantities of redfish, much of which was frozen for export to America.

International Administration. The 39th meeting of the International Council for the Exploration of the Sea was held in Amsterdam. The first meeting of the International Commission for the Northwest Atlantic Fisheries, whose aim was to investigate, protect and conserve the fisheries of the north Atlantic ocean, was held in Washington in April. Panels on which interested countries were represented were set up for each of the five sub-areas into which the region was divided, and preliminary programmes of investigation were arranged. The question of whether the Georges Bank haddock stock was overfished was one of the more urgent problems discussed. United States, Canadian and Japanese delegates met to negotiate a North Pacific Fisheries agreement on the conservation of fishery resources in that area. The United States proposal to close the area to countries without already established fisheries within it was opposed.

At the International Court of Justice at The Hague the dispute between Great Britain and Norway was heard. The dispute arose when Norway enforced her 1935 decree claiming sovereign right to waters within four miles of her coast as measured from straight base lines connecting 47 extreme points. Some of the points were up to 40 mi. apart and most were situated along the outer fringes of coastal islands. Great Britain maintained that the four-mile limit should be measured from the line of low-watermark along the entire Norwegian coast, despite the extremely indented nature of the coastline. The effect of the Norwegian claim was to close certain bays and stretches of coastal waters to foreign fishing. As the U.S.S.R. was enforcing a Soviet decree claiming a 12-mi. belt of coastal waters against Danish and Swedish fishing vessels, and Iceland had issued a decree similar to the Norwegian one of 1935 which would considerably restrict her fishing grounds to international exploitation, the Anglo-Norwegian dispute was something of a test case. Judgment was given at the end of the year. The court, by 10 votes to 2, upheld, as not contrary to international law, the Norwegian decree of 1935. It deemed that the method of measuring territorial waters used in the

1935 decree had been established and consolidated in the Norwegian system by constant and sufficiently long practice. The decision was of significance and importance to all marine fishing nations.

Development and Research. Initial steps were taken towards developing fisheries, especially in some tropical countries where the native fishermen were unfamiliar with modern techniques and machinery and had little capital to finance new methods of fishing. Ceylon sent men to Australia for technical training and to Japan with a view to reorganizing the Ceylon fishing industry by the adoption of Japanese methods. A large Japanese trawler was also engaged in the development of Indian fisheries off the Bombay and Saurashtra coasts. In Nigeria, the Colonial Development corporation formed the nucleus of a trawl fishing industry by operating two steam trawlers. In Kenya, a Mombasa firm began trawling and lining off the Seychelles. Egypt adopted a plan to increase the annual fish yield of 55,000 metric tons by about 20% within three years by organizing the fishing industry on the basis of modern techniques and by the expansion of fish culture. One development project, the Atlantic Fisheries scheme of the British Colonial Development corporation, failed and operations were discontinued, the factory ship "Africa Queen" being offered for sale. The aim of the scheme had been to process the produce of shark and tuna fisheries, but high operating costs prohibited profitable working. In the major trawl fisheries of the world the trend towards building motor driven vessels rather than steam vessels continued. The first diesel-electric trawler ever built, the "Freiburg-im-Breisach," of 169 ft. overall length and 449 gross registered metric tons, was completed in Germany in 1951. In the United States, fish pumps were successfully employed for unloading sardines from the holds of ships and also for sucking fish out of purse-seines into ships. The method reduced handling of fish and facilitated the salvage of scales which were a valuable fisheries by-product.

Some of the more notable achievements in fisheries research in 1951 concerned the study of the movements of herring in north Atlantic and European waters by the method of tagging live fish. The interchange of fish between several local fisheries around the North sea and, more remarkably, between Icelandic and Norwegian coastal fisheries, was demonstrated. Following information from the Norwegian research ship "G.O. Sars" observing the movements of herring shoals between Faroe and Norway in association with water movements, some Norwegian fishermen made very heavy catches of herring before the shoals arrived on the usual fishing grounds. The work of the English research vessel "Ernest Holt" on the Arctic cod fishing grounds suggested that concentration or dispersal of fish was, under certain circumstances, affected by the temperature of water masses. (See also MARINE BIOLOGY.) (A. R. M.)

FIVES. *Rugby Fives.* A. D. R. Dawes, the open singles holder, retained his title, defeating E. R. Conradi (schools champion, 1938) in the final. Dawes and Conradi won the open doubles beating the Oxford pair, J. T. Rogers and J. T. Burton in the final.

Thirty-five schools were represented in the schools competition; 64 competitors were entered for the singles and 40 pairs for the doubles. The singles holder, J. F. Pretlove (Alleyn's), again defeated S. M. Pickard (Oundle) in the final. Alleyn's was also successful in the doubles, J. F. Pretlove and J. S. T. Fletcher beating the Oundle pair, S. M. Pickard and M. P. Skliros, in the final. In the university match Cambridge beat Oxford by 285 points to 150. R. A. Colville was elected honorary secretary of the Rugby Fives association, John Armitage having resigned after 17 years'

service. Armitage, V. E. A. Bowley, K. W. Millage and J. J. Spragg became vice presidents. (G. R. RR.)

Eton Fives. P. B. H. May and J. W. H. May defeated A. R. Kittermaster and A. R. B. Mouldsdales by three games to none in the final of the amateur championship (Kinnaird cup), for which 30 pairs again entered. The winners had not entered the championship together before and were the first holders of the cup to come from the postwar generation of players.

In the final of the public schools' handicap competition, Eton (A. C. Ingleby-Mackenzie and N. F. Robinson) beat Uppingham (D. S. W. Lee and R. M. Corner). Cambridge defeated Oxford by three matches to none. (H. L. B.)

FLAGSTAD, KIRSTEN, Norwegian operatic singer (b. Harnar, Norway, July 12, 1895), made her first public appearance in Oslo in 1913. During the first few years of her career she sang not only in opera but also in operetta and musical comedy in Oslo. In 1930, after her second marriage, she decided to retire, but because the opera house at Gothenburg, Sweden, needed a soprano, she resumed her career a few months later. In 1932 in Oslo she sang Isolde in *Tristan und Isolde* for the first time. The following year she was engaged to sing at the Festspielhaus, Bayreuth, and on Feb. 2, 1935, made a successful first appearance at the Metropolitan Opera house, New York, as Sieglinde in *Die Walküre*. In the following year she was equally well received at the Royal Opera house, Covent Garden, London, and in Vienna. In 1938 she toured Australia. Meanwhile, she remained principal Wagnerian soprano in New York until 1941 when she returned to Norway. From that year until 1947 she sang only four times but then she once more gave concerts all over Europe and the U.S. Flagstad reappeared as Isolde at Covent Garden on Feb. 19, 1949, before an enthusiastic audience. Every year after that she sang all the principal Wagnerian roles there, but on June 25, 1951, by her own wish, she sang Isolde in England for the last time. However, in September, she took the part of Dido in Purcell's *Dido and Aeneas* at the Mermaid theatre, London (a playhouse of the Shakespearian type established in St. John's Wood by the actor Bernard Miles in 1951). During the autumn she gave recitals at the Mermaid theatre, the Wimbledon town hall, the Royal Festival hall, London, and in Paris, and also took part in the memorial performance, *Salute to Ivor Novello*. Flagstad also made records of opera and Norwegian songs.

FLAX: see LINEN AND FLAX.

FLOODS AND FLOOD CONTROL. In Great Britain the year 1951 opened in most parts of the country with extremely heavy snowfall, and the thaw was immediately followed by prolonged and severe rainstorms. As a result, considerable flooding occurred over a period of several weeks, and in many places roads became blocked and bridges were impassable. Rivers rose very rapidly, and much damage was done in the north of England and in Scotland. Thick snow fell again in February, and the rainfall in the south, particularly in the Thames valley, was the highest ever recorded. At Kew observatory 4.21 in. of rain fell in the course of three weeks; the previous highest total for the whole month of February was 4.13 in., in 1879. In the Thames basin the rainfall for the month of February was 5.23 in., which exceeded the previous highest total of 4.96 in. recorded in Feb. 1900. Flood warnings were issued on ten consecutive days. In November, heavy rainfall was again experienced in most parts, and more extensive flooding occurred over large areas. Compared with the normal amount of 2.7 in. for the month, the rainfall in the Thames basin reached about 7 in.

In Surrey, a conference of local authorities was convened to consider a £600,000 flood prevention scheme, and the Bala Lake scheme of the Dee and Clwyd River board, which had the dual purpose of flood prevention and the provision of compensation water to the River Dee, estimated to cost £273,000, was approved.

Extensive new land drainage powers for river boards were proposed in a comprehensive report of a subcommittee of the Central Advisory Water committee, published by H.M.S.O. in April 1951. The report recommended the control of watercourses for which no drainage authority was responsible; methods of raising additional revenue; and further financial assistance to river boards and other drainage authorities with limited local resources.

The Rhine overflowed its banks at Bonn on Jan. 23, and at Cologne and other places the basements of houses near the river were flooded. In March, the rivers Guadalquivir and Guadaira in Spain overflowed as the result of heavy rains, and 4,000 people were rendered temporarily homeless in Seville, when the rivers flooded the low-lying districts on the city's outskirts. Great damage was caused in Granada in September by a cloudburst, unparalleled for 60 years, and the River Darro, which traverses the city in a covered channel, burst through the masonry.

As a result of heavy rains in May, the Inn river in the Engadine overflowed its banks near Sanaden, where four square miles of the plain were inundated. In July, melting snows, heavy rainstorms and strong winds combined to swell the River Rhône throughout its course in Switzerland, and raised the level of Lake Geneva to an unusual height. The mountain torrents brought down masses of rock, stones and earth, causing damage to fruit gardens and farms. At the western end, the Geneva lakeside promenades were awash, and the valley road to the Simplon pass at the eastern end was impassable. Three weeks later, further tremendous rains over eastern and southern Switzerland caused widespread floods, swept away railway bridges and blocked roads with landslides. The River Maggia, near Locarno, rose 7 ft. in half-an-hour, and the Cassarate river overflowed and flooded parts of Lugano at the height of the holiday season. The Sanaden river overflowed its banks again and large areas of land were inundated near St. Moritz. Similar storms occurred in cantons Ticino and Grisons; many towns were completely isolated, and the railway line linking Switzerland and Italy was blocked. Landslides occurred and much damage was done.

In the Lake Como area of Italy it was necessary to use explosives to clear river beds of obstacles brought down by flood waters, and many persons were buried under the mud.

On Aug. 8, in the vicinity of Paris and Amsterdam, over a month's rainfall fell in a few hours, causing flooding and dislocation of gas and water supplies in places.

In southern Italy, violent storms caused severe flooding in October, and many places in Sardinia and Calabria were isolated; road and railway bridges collapsed, and the supply of drinking water was interrupted by the destruction of 14 aqueducts. Over 70 deaths were reported. An abnormal rainfall of 16 in. in 19 days occurred in Malta in October, resulting in the flooding of large areas and the loss of lives and property.

Extensive flooding of the Po and Adige rivers in northern Italy in November, the worst for more than half a century, caused about 150,000 people to flee from their homes in villages near Ferrara, and the dykes surrounding Rovigo were destroyed. A death roll of about 100 was reported. British amphibious troops from Trieste rescued marooned villagers, and United States transport planes assisted in the rescue work. Over 150,000 ac. of agricultural land were under as much as 12 ft. of water, and there was widespread dislocation of road and rail traffic out of Turin and Milan. The main lines

Flood waters in northern Italy in Nov. 1951. Following heavy rains the Po and Adige rivers overtopped their banks causing the worst floods in northern Italy in modern times.

through the Simplon and St. Gotthard passes were under water. Lake Como overflowed and Lake Maggiore rose 7 ft. in 36 hr. In Venice, most of the squares and streets were under 5 ft. of water, and many of the city's population of 300,000 were stranded in their homes. On the Riviera more than 6 in. of rain fell in a week and the Charles Albert bridge across the Var at St. Martin, 6 mi. from Nice, collapsed. At Avignon the river rose 20 ft. above normal level.

In January, four-fifths of the state of Queensland, Australia, suffered from the effects of torrential rain and flooding, and rivers in the central, western and northern parts of the state broke their banks. Hundreds of square miles were submerged, causing many roads to be completely out of use and resulting in dozens of breaks in the railway lines. At about the same time, Johannesburg, South Africa, experienced the heaviest rainfall ever recorded, when 8·7 in. were registered in 40 min. During the storm, whirlwinds and gales lifted roofs and tore down trees.

Flooding of the Brahmaputra, in Upper Assam, India, was reported, in September, to have caused the complete washing away of the Assam saw mills and factory, which produced 500,000 tea chests a year, about one-fifth of the country's total production. In October, it was reported that the worst seasonal rains for 50 years had washed away bridges and buildings in the Yemen, and in one area 40 deaths occurred. Across the Red sea, Eritrea also suffered, and great damage was caused in the Keren valley.

In China, extensive work was carried out in the provinces of Shantung and Kiangsu on the River Shu-ho in order to avert the danger of flooding. A system of dams and several big weirs was built along the river over a distance of 140 km., and the flow was to be diverted through a new course, made considerably deeper and wider, through a mountain ravine 14 km. long, direct to the sea. It was claimed that this would prevent flooding resulting from the merging of the rivers Shu-ho and I-ho. In Korea the heaviest floods for 60 years occurred in August, destroying crops and causing great material loss to the population. (J. Kd.)

United States. The U.S. flood control act, approved Oct. 24, 1951, provided \$388,544,100 for flood control work during the fiscal year ending June 30, 1952. Apart from the lower Mississippi river and the Sacramento river, flood control construction was continued or begun on 78 projects in 32 states. The \$60·5 million funds allotted to the lower Mississippi river project were designated for work in seven states: Kentucky, Illinois, Tennessee, Louisiana, Missouri, Arkansas and Mississippi. Congress also passed a supplementary appropriation act, providing a total of \$12·9 million. Another \$12 million was allotted for additional emergency

work during the Kansas river flood. This fund was additional to special funds appropriated by congress for flood relief in Kansas handled by the particular relief agency set up by the president.

At the end of June 1951, approximately 334 flood control projects were in operation. The three largest multi-purpose projects placed in operation during the fiscal year were Fort Gibson reservoir, Oklahoma, Bull Shoals reservoir, Arkansas, and Hulah reservoir, Oklahoma.

Channel improvement of the Mississippi river proper was continued during 1951 at a number of places below Cairo, Illinois. Additional levee construction authorized by congress brought the total system to about 3,000 mi. of levees. Completed levee construction totalled about 1,650 mi. of main-stem levees, extending from near Head of Passes, Louisiana, to Rock Island, Illinois. Co-ordinated with the main-stem levees were 1,400 mi. of tributary levees, about half-complete in 1951. Below Cairo work continued on river bank protection. Revetment in place totalled about 225 mi. of river bank.

The rapid melting of excessive snow cover in the Minnesota river basin caused the river to flood in April, causing damage exceeding \$10 million. Other big floods occurred in Washington and Oregon from the Columbia river and tributaries; on the Arkansas river in Arkansas and Oklahoma; the upper Cumberland in Kentucky; the Missouri river in Nebraska and Iowa; and the Warrior system in Alabama.

Between May and July a record rainfall over about 1,000 sq.mi. with Kansas in the centre caused rivers of the region to rise to unprecedented heights. The Missouri, the Kaw (Kansas), and the upstream tributaries, the Republican, Saline, Smoky Hill, Solomon, Blue and the Little Blue flooded, causing the greatest flood damage on record: \$1,000 million in property was lost and an equal amount in farm crops and wages. The Kaw (Kansas) river broke its banks above Kansas City, Missouri, and, descending on the city from the unprotected rear, flooded the industrial section. In Kansas, the tributaries flooded Lawrence, Topeka, Saline and about 100,000 ac. of cropland. (See also METEOROLOGY; SOIL CONSERVATION.) (G. Hb.)

FOOD RESEARCH: see NUTRITION.

FOOTBALL. Association. England's association football team once more in 1950 resisted every attempt to inflict a first home defeat by a side from outside the British Isles, but her supporters had an anxious time before she drew 2-2 with Yugoslavia and France and beat Argentina 2-1.

Again there was great argument as to whether it was the foreigners' improvement or the Englishmen's decline which was responsible for the closeness of the struggles; many held that both these factors contributed but that the main reason was the length of the Football league season and its cut-throat competition—there were, however, just as many league matches when England was sweeping all before her.

No doubt the English team of 1951 was not so good as that which did so well just after World War II, but there was a notable improvement in the standard of play produced by many league teams. Tottenham Hotspur, who had been the most attractive side in the country while winning the second division title in 1950, went straight on in the first division to win the championship, a feat previously achieved only by Everton and Liverpool; they did so with the same side, the same neat ground passing and the same admirable teamwork. Portsmouth, the previous holders of the first division championship, were unbeaten in their last 12 games but a bad start kept them down to seventh place. For the fourth time in five years the runners-up were Manchester United, still under the managership of M. Busby, who had been a great Scottish half-back. They still had a fine defence and at times still produced form against which none could stand. Blackpool, Newcastle United and Arsenal were the next three in the table. All these six clubs, except Newcastle, had concentrated for many years on training their own young players and made few entries into the transfer market; their players were, indeed, true club members and nine of Tottenham's first eleven had never played for any other league club. Sheffield Wednesday (promoted in 1950) and Everton were relegated from the first division and were replaced by Preston North End and Manchester City (relegated at the end of the 1949-50 season). Rotherham and Nottingham Forest were promoted from the third division to the second in place of Grimsby Town, whose fall from the first division had been catastrophic, and Chesterfield. Workington moved to the third division in place of New Brighton.

Newcastle United won the Football association cup, beating Blackpool, including the evergreen S. Matthews, by 2-0 in the final. At one time they were thought to have a great chance of achieving the elusive double, but between the semi-final and the final they won only one of 11 league games. Like the other successful sides of the year they had strength at half-back, with F. Brennan a solid "stopper" in midfield; J. Milburn was a good leader in attack and scored in every round. They had one nasty shock when they were held to a draw at home in the sixth round by third division Bristol Rovers, but won the replay convincingly. Wolverhampton Wanderers and Birmingham City were the beaten semi-finalists and Manchester United again reached the sixth round, after beating the holders, Arsenal, by 1-0 at Old Trafford. Pegasus, a combination of past and present undergraduates of Oxford and Cambridge, achieved fame in their third season by winning the Football association amateur cup with 2-1 against Bishop Auckland in the final. They never played a home game in the competition and five out of seven times faced almost certain defeat near time, but a gallant defence and fast methodical attack triumphed. Their coach was V. Buckingham, of Tottenham Hotspur. The final at Wembley attracted a world record crowd, for an amateur match, of 100,000.

In Scotland a young Hibernian side was outstanding, finishing ten points ahead of Glasgow Rangers, the league and cup title-holders, in the league and beating them in a second round cup-tie before losing to Motherwell in a semi-final. Celtic won the cup final 1-0. Rangers still had a fine defence but their attack was erratic, whereas Hibernian were well-balanced and had a splendid attacker at centre or outside

forward in L. Reilly, who shot 37 goals in cup and league games. Clyde and Falkirk were relegated from Division A and Queen of the South and Stirling Albion returned at the first attempt.

Scotland won the home international title, beating Wales 3-1 at Cardiff, Ireland 6-1 at Hampden Park and England 3-2 at Wembley, and also defeated Belgium 5-0, France 1-0, and Denmark 3-1, but lost 0-1 and 0-4 to Austria, perhaps the best of the European teams. England beat Wales 4-2 at Sunderland and Ireland 4-1 in Belfast; Wales won 2-1 in Belfast.

The transfer system was under heavy fire during the season from many quarters, not least the Players' union, which desired to have contracts between players and clubs for a fixed number of years with the player completely free at the end of the contract.

At the start of the 1951-52 season the Football league clubs became so alarmed by what they believed was the adverse effect of broadcast commentaries on attendances that they banned broadcasts during play; this aroused loud and angry remonstrances from newspapers and members of parliament, and the football league eventually agreed to the broadcasting of matches provided the public was not informed in advance which match was to be broadcast; the Football association continued to allow broadcasts of certain matches arranged by it to be publicized in advance.

Rugby Union. During the first years after World War II much Rugby union play in all countries was disfigured by bad scrummaging, scrum-halves often being unable to insert the ball properly and some hookers developing great cunning at collapsing a scrum when a delay was to their advantage. The international board met in London in March and made important alterations in the rules. The front row forwards were ordered to bind together firmly and continuously while the ball was in a scrum and the wilful collapsing of a

Three of the Pegasus team jumping to head the ball in the final of the F.A. Amateur cup at Wembley, April 21, 1951. Pegasus beat Bishop Auckland by 2 goals to 1.

scrum was made punishable with a penalty kick; this change was reported to have proved satisfactory during the New Zealand and South African seasons. The board also made it clear that the method of heeling the ball in scrummages adopted in South Africa in recent years was illegal; the relevant paragraph in the rules was altered so that it was clear that the ball must be put into the scrummage again if it passed between the feet of the near outside man of the front row on its way out. Minor alterations included a decision that a knock-on should not be recognized as such if the ball is knocked-on by a player in the act of charging down an opponent's kick.

That there was still work for the board to do became clear at the start of the South African tour of the British Isles and France in Oct. 1951. The South Africans were taken aback by finding that in England packs were allowed to shove before the ball was inserted into a scrummage, and that the scrum-half was allowed to show the ball to the front row forwards and then withdraw it before inserting it; in South Africa premature shoving had been punished with a penalty kick and so had been a scrum-half who withdrew the ball after showing it and misleading the front row men into premature striking.

The South Africans had great strength forward, where they were big, fast, and well-combined; B. Kenyon, the touring captain, H. Muller, captain of Transvaal, the Currie cup winners, J. Pickard, W. H. M. Barnard and C. J. Van Wyk were outstanding all-round players. A. Geffin was a remarkable place-kicker on his day. Apart from the scrum-halves and J. D. Brewis, the first stand-off half, the backs were disappointing in early games, however, and this led to some close struggles. The side won 21 games, losing only one, to London Counties by 9-11, by the end of 1951.

Ireland won the championship in the 1950-51 season to the general surprise, and to the particular discomfiture of Wales. The Welsh began with a 23-5 win over England at Swansea, but lost 0-19 to a young and inexperienced Scottish team in Edinburgh after the Scots had lost 12-14 in Paris. The Welsh were over-confident at the start, were painfully surprised by the speed and fury of the Scottish pack and collapsed utterly in the last ten minutes after a dropped goal by P. W. Kininmonth from the touch line made it 6-0. Ireland got home by 9-8 and 3-0 against France and England in Dublin, owing everything to her forwards and J. W. Kyle. Scottish hopes were high when Ireland visited Murrayfield, and when G. Norton, the Irish full-back and place-kicker,

had to retire after 15 minutes all seemed over. Scotland quickly led 5-0, but the Irish forwards, especially P. J. Lawler, a newcomer, rose to great heights, and with Kyle dominating the back divisions Ireland won with a dropped goal and a try in spite of missing easy place kicks. Wales dropped Lewis Jones because of his poor defence at Murrayfield; unfortunately this so weakened her attack that she could only draw 3-3 with Ireland at Cardiff, thanks to a monstrous penalty goal by B. Edwards; she was beaten 8-3 in Paris. France won her first victory at Twickenham by 11-3, but England won the Calcutta cup by beating Scotland 5-3; the Scots were clearly suffering a reaction forward from the hammering inflicted by the Irish, and their scrum-half had a horrid day. In this match England had at half-back D. W. Shuttleworth and E. M. P. Hardy, both of Yorkshire and the army, who had fought a duel for the job all season with G. Rimmer and J. Regan, of Lancashire. Rimmer played in the first three internationals, but was clearly worn out by having to play all season behind beaten club, county and national forwards; Regan was picked to play against Ireland but had to scratch because of an injury.

East Midlands, runners-up in 1950, won the county championship, beating Middlesex in the final. Gloucestershire and Yorkshire were the beaten semi-finalists. Oxford beat Cambridge 8-0 in the 1950-51 season, their fourth win since 1946.

Rugby League. There were two notable features of the year in Rugby league football. France won the home international championship on points average, and then on her first visit to Australasia beat Australia in the tests and only just lost to New Zealand in a rough match at Auckland. The French team received almost a national welcome on its return to Marseilles, but some of the gilt vanished when a few weeks later the side was beaten 17-14 at Hull by Other Nationalities in another rough match in which the mixed side rarely had more than 11 effectives.

Workington Town won the Northern Rugby league championship after only six seasons as a senior club and became the first club from outside Lancashire and Yorkshire ever to win the title. They were in every sense a good team and were finely led on the field and shrewdly managed off it by A. J. Risman, who had now played in first-class football for 23 years and first reached the final, for Salford, as far back as 1933. In their last three matches of the 1950-51 season, Workington won at Wigan in an ordinary league

The South African Rugby touring team (dark jerseys), the Springboks, in the first game of their tour against Hampshire and Sussex at Bourne-mouth, Oct. 10, 1951. The Springboks won by 31 points to 6.

game, won at Wigan in a semi-final and beat Warrington in the final on Manchester City ground. Wigan were beaten fair and square, but Warrington were unlucky to lose A. Johnson, a test wing-threequarter, early in the game before being defeated 26-11. Leigh were the other beaten semi-finalists. In spite of their defeat in the league semi-final, Wigan once more were the outstanding side of the year. They reached the Rugby league challenge cup final at Wembley for the fourth time and won there for the third time, beating Barrow 10-0, and retained the Lancashire cup for a sixth year; they were narrowly beaten into third place in the Lancashire league by Warrington and Workington. Leeds won the Yorkshire league and Wakefield the Yorkshire cup. Cumberland took the county title on points average. Cardiff and Doncaster were admitted to the Northern Rugby league for the 1951-52 season.

The New Zealand team which arrived in Britain in the autumn had been delayed and had to play its first match within 48 hours of landing. After a shaky start the New Zealanders settled down well and beat Workington Town, Warrington, Wigan, Leigh and Huddersfield in the first two months. They were unlucky to lose the first two tests 15-21 and 19-20, after having the better of the game in each case.

(L. M.)

United States. The 1951 season was rather unhappy for inter-collegiate football in the United States. The game came under the severest criticism for many years. The lengths to which some colleges went to field a winning team—"doctoring" student high school transcripts, giving athletic scholarships in quantities and permitting players to take useless courses towards degrees—awakened the country to the need for reform (see EDUCATION).

The end of the playing season found Tennessee ranked as the number one team of the country. The Volunteers had a perfect record for the first time since 1940 and were awarded the Father O'Donnell trophy, given annually to the team that finishes at the top in the final Association Press poll. Then followed, in that poll, Michigan State, Maryland, Illinois, Georgia Tech., Princeton, Stanford, Wisconsin, Baylor and Oklahoma.

Princeton won the Big Three honours for the fifth year in succession and also won the Lambert trophy, and the Ivy league championship for the second successive year.

The sectional champions were as follows: Eastern, Princeton; Big Ten, Illinois; Pacific Coast, Stanford; Big Seven, Oklahoma (fourth year in succession); Southwestern, Texas Christian; Southeastern, tie between Tennessee and Georgia Tech.; Southern, tie between Maryland and Virginia Military Institute; Missouri Valley, Tulsa.

In professional football, the Los Angeles Rams ended the Cleveland Browns' five-year record of invincibility to win the championship of the National Football league. Finishing top of the National conference division, they defeated the Browns, champions of the American conference in the play-off.

Canada. A record Canadian football crowd of 27,326 saw the Ottawa Rough Riders win the Dominion championship. In the East-West final for the Grey cup they defeated the Saskatchewan Roughriders, 21-14. The college championship was won by the University of Toronto Blues who defeated the McGill Redmen, 11-7.

(A. DA.)

FORAGE CROPS. Pastures and root tops provided ample feedingstuffs in the early part of the winter, but by Feb. 1951 many farmers, especially those in upland areas, foresaw that they would be short of fodder if the rest of the winter was severe. The winter was not especially cold but the spring was cool and wet, so that fodder stocks on many farms were used before there was a satisfactory growth of grass. Some farmers had to buy fodder crops, and livestock

had to be turned into many fields while the soil was still sodden. In consequence, damage to pastures by trampling was widespread. Haymaking began later than usual but some spells of good weather allowed most of the main crop to be gathered in good condition. The yield per ac. of seeds hay was rather above average but that of meadow hay rather below. The practice of baling hay in the field was increasing.

SOURCE: *Monthly Digest of Statistics*, Sept. 1951.

In spite of the wet winter, pulses for stockfeed grew well, though peas and spring sown beans were later than usual. Farmers were delayed almost everywhere in preparing the spring seed beds so that roots and kale crops were sown late. They grew slowly but damage by pests was not serious. Yields of turnips, swedes and mangolds were similar to those of 1950.

The government continued to urge farmers to maintain the largest possible area under the plough and to get the most out of grassland, arguing that the prospects for supplies of imported feedingstuffs were uncertain and the only feedingstuffs farmers could rely on were those they grew themselves. The price of purchased feedingstuffs, some four times the prewar level, reinforced this argument, but many farmers were impressed by the risks of heavy harvest losses of cereals in wet years. Certainly the area under grassland increased by about 600,000 ac. between 1950 and 1951.

(K. E. H.)

FORESTRY. One of the most important events during 1951 was the transfer to Rome of the headquarters of the United Nations Food and Agriculture organization, including the Forests and Forest Products division. It was chiefly due to this move to Europe that a number of forest officers with experience of European forestry methods were sent on missions to various parts of the world under the Expanded Technical Assistance scheme. As a result new forest policies were adopted in several countries where scientific forestry had been unknown.

Great Britain. Publication in April of a summary report of the census of woodlands of 1947-49 resulted in a general appreciation of the paucity of homegrown timber sources and the need for tighter control of fellings. It also showed the full extent of wartime fellings: 800,000 ac. needed complete restocking. Up to 1951 only about 82,000 ac. was replanted or restocked, about half by the Forestry commission and half by private owners. This great replanting task was being further increased by about 22,000 ac. of new fellings each year, and it was obvious that the rate of rehabilitation of Britain's woodlands continued to be much too slow.

The planting up of new ground, usually a simpler task than rehabilitation, made good progress, particularly in Scotland where forest villages were built to house those who would be employed on the new woodlands. Mechanization

of forestry work increased both in nursery operations and in the extraction of timber, but planting continued to be done by hand, the British soil and climate being unsuitable for tractor-hauled planting machines. The thinning of large areas of young coniferous plantations absorbed even more labour than in previous years, and the 1950-51 financial returns showed that the disposal and use of the resulting small timber had now become an important industry.

The scheme of dedication of privately owned woodlands to permanent forest management, which had made slow progress in the previous four years, at last made better headway and about 250,000 ac. were in process of dedication during 1951. Silvicultural research included a study of the history and present condition of the Yorkshire moors in relation to forest potentialities. Research was continued by the Forestry commission on the effects of drainage of peatlands and in the planting of upland heaths.

Commonwealth. The progress made during previous years in both aerial and ground surveys of the forests of Australia made possible the compilation of maps of the commercial and reserved forest areas throughout the country. These were completed and printed during 1951, and plans for a national inventory of forests were agreed upon at an interstate conference and work began in June. Australia celebrated its jubilee year with a great tree-planting drive. In Queensland large quantities of nursery transplants were issued free to schools, and at a cheap rate to farmers. The Australian public was becoming tree-conscious and this greatly helped in undertaking new measures to suppress bush fires, the Australian forester's greatest problem. New fire-fighting equipment included two-way radio installations to connect the fire lookout towers with the fire-fighting crews and helicopters to take men to fires in remote areas. The opening up of the Dorrigo area forests in New South Wales made Wauchope the state's largest source of timber.

In Canada one of the chief effects of the Canada Forestry act was to give federal assistance to the provincial governments. A nationwide inventory was to be completed as quickly as possible and the rate of reforestation was to be greatly increased with federal help. British Columbia suffered from severe forest fires and, because of dry inflammable conditions for several months during the summer, logging operations were suspended over large areas.

In South Africa the long-disputed question of logging and sawmilling by the state was settled on lines that gave the private sawmiller a fair share in the out-turn from state plantations. Extraction of timber from mountain slopes by cable was further developed and a new type of Swiss cableway was installed in two forests. Extensive new plantations of conifers were started in Swaziland by the Colonial Development corporation and this entailed important road and bridge construction to open up the country.

The West African colonies found a greatly increased demand for tropical timbers, and the lesser-known timbers had a readier market. Difficulties in the conversion and seasoning of some of these timbers showed the need for further research, and the prevention of damage by sap-stain and wood-borers was also a difficult problem. Qualified forestry staff was still very short.

The East African Agriculture and Forest Research organization centre in Kenya opened its new headquarters building in April. The appointment of a number of senior forest officers to the organization ensured co-ordination of forestry research in Kenya, Tanganyika and Uganda on sound lines. In Northern Rhodesia and Nyasaland declarations of forest policy were made which were expected to lead to a better understanding of the needs of forestry in these countries. The heavy fellings of timber in Northern Rhodesia to meet the fuel and constructional needs of the copper mines

resulted in forming what was probably the largest single area of newly exploited forest in Africa. The Forest department was doing all that was possible to obtain a satisfactory regrowth on the cleared areas, and it was expected that more coal might be available to reduce the heavy demands for wood fuel. An important development was the opening up of forests on high plateaux, formerly considered to be commercially inaccessible. The Rondo plateau in Tanganyika and the Mlanje plateau in Nyasaland were both exploited for the first time on a commercial scale, and similar development on the slopes of Kilimanjaro, Tanganyika, was under consideration.

In British Guiana the exploitation of the forests, not long started by the Colonial Development corporation and a number of private firms, led to some public criticism of the methods employed to ensure future replacement. Reports of the good natural regeneration which followed the heavy fellings were, however, more reassuring.

Europe. In France good progress was made in the regeneration of the large pine forests in the Landes which were destroyed by fire in 1945 and 1947. The burnt timber had been removed and the sowing of maritime pine was supplemented by planting protective strips of other species. In Switzerland the great avalanches in the early months of 1951 devastated about 2,000 ac. of forest and destroyed over 100,000 cu.m. of standing timber. In spite of a shortage of timber, which kept sawmills from full production, the fellings in both communal and cantonal forests were not allowed to exceed the annual normal growth increment, and timber-using industries were maintained by larger imports.

(A. H. LD.)

United States. Forest products plant expansions, proposed under the provisions of the Defence Production act, 1950, were expected to cause a substantial increase in the drain on the timber resources of the United States. Many of the proposed expansions of plant capacity, however, would involve the increased use of mill or woods waste, or of hitherto little-used tree species. Others were in places where an increase in timber growth was in prospect, because of fire protection, reforestation and improved forest management.

The report of the president's Water Resources Policy commission recommended the control of the deterioration of certain watershed forest lands within a reasonable period of time. Forestry agencies assisted federal inter-agency river basin committees in the preparation of comprehensive plans for the development, utilization and conservation of the water resources of the Arkansas-White-Red river basin and of the New England-New York region. In the Columbia and Missouri river basins the department of agriculture was engaged in the development of comprehensive forestry programmes.

The area of national forests and other conservation lands under the administration of the U.S. forest service on June 30, 1951, was 181,034,882 ac. The properties included 151 national forests, 33 purchase units established in pursuance of the Weeks law of 1911, 16 experimental areas and 9 land utilization projects. During the fiscal year, 25,451 timber sales were made. The volume of timber cut from the national forests totalled 4,688 million bd. ft., the highest for any year since the national forests were established.

The largest timber sale of the year made by the forest service—of 1,500 million cu. ft. to the Ketchikan Pulp and Paper company—was in the Tongass National forest in Alaska. The sale contract provided for the handling of the timber on a sustained-yield cutting plan. (See also NATIONAL PARKS; SOIL CONSERVATION; TIMBER.) (C. E. R.)

FORMOSA (TAIWAN). Large island in the western Pacific separated from China by the 90 mi.-wide Straits of Formosa. Area: 13,906 sq.mi., including Pescadores and 75 neighbouring islands. Pop.: (1940 census) 5,872,084; (mid-1951 est.) 10,000,000, including Chinese Nationalist troops and refugees from the mainland. Language: mainly Chinese. Religion: Buddhist, Confucian and Taoist. Chief towns (pop., 1950 est.): Taipei (formerly Taihoku, cap., 450,800); Kaohsiung (Takao, 275,600); Tainan (229,500); Taichung (Taichu, 207,000); and Chilung (Keelung or Kiirun, 145,200). Governor, Wu Kuo-cheng (K. C. Wu).

History. Formosa, the only territory remaining in the control of the Chinese Nationalist government; was converted into a Nationalist military stronghold in 1949 and 1950. The capital of the Nationalist government was moved to Taipei, on Dec. 8, 1949. During the year Generalissimo Chiang Kai-shek continued to act as president of the republic and General Chen Chang as prime minister. There was also a Legislative Assembly of 702 elected members presided over by Liu Chien-chiu.

To assist the Nationalist government in the defence of Formosa, the United States established the U.S. military assistance advisory group on May 1, 1951, under the command of Major General William C. Chase.

Education. Schools (1949): primary 1,199, pupils 900,648; intermediate 206, pupils 114,616; higher education: 1 university and 5 colleges with 5,905 students. Illiteracy (1951 est.): 40%.

Agriculture. Main crops (1950-51, '000 metric tons): rice (brown) 1,421.8; sugar, raw value 362.9; tea 6.7; pineapples 26; bananas 128; citrus fruit 28.8; tobacco 9.6; jute 5; sweet potatoes 1,420; peanuts 65; wheat 12; barley 2. Fisheries (1950-51): total catch, 64,500 tons.

Industry. Production in the year ending June 30, 1951 ('000 metric tons): coal 1,414; cement 361; paper 19; chemical fertilizers 77; sulphur 4.5; salt 202; cotton yarn 2.2; cotton cloth 22 million metres. About 4,000 troy ounces of gold were mined monthly.

Foreign Trade. Formosa's chief exports in 1950 were sugar, coal, salt, camphor, tea, rice and fruits. Chief imports were fertilizers, raw cotton and machinery. Japan and the U.S. were Formosa's important trading countries. In 1950 exports amounted to the equivalent of U.S. \$72.4 million, of which sugar represented \$54 million, while imports totalled U.S. \$91.6 million, excluding E.C.A. aid. During the first six months of 1951, exports totalled U.S. \$54 million and imports totalled U.S. \$44.3 million.

Finance. A dual exchange-rate system was instituted on April 10, 1951, providing for a foreign exchange certificate rate and an official exchange of N.T.Y. 15.95 and N.T.Y. 10.30 respectively to U.S. dollar. Certain transactions on government account, as well as certain specified private transactions, were accorded preferential treatment. On Sept. 30, 1951, the total note issue was about 450 million new Taiwan yuans. Total revenues of the central, provincial and local governments in 1951 were estimated at N.T.Y. 1,385 million and expenditures at N.T.Y. 2,350 million. The deficit was made up from continued liquidation of the government's gold and other assets and from the sale of E.C.A.-financed goods. The E.C.A. programme provided for the expenditure of U.S. \$98 million in the year ending June 30, 1951. About \$80 million was made available in 1950-51 for military assistance. (S. NR.)

FRANCE. Republic of western Europe bounded N. by the English channel, N.E. by Belgium and Luxembourg, E. by Germany and Switzerland, S.E. by Italy, S. by the Mediterranean sea, S.W. by Spain and W. by the Atlantic ocean. Area: 213,010 sq.mi., including the Mediterranean island of Corsica (3,367 sq.mi.) and small Alpine territories ceded by Italy in 1947 (273 sq.mi.). Pop.: (1946 census) 40,502,513; (Dec. 1951 est.) 42,400,000. Language: French is almost universally spoken but there are also other regional languages or dialects: German in Alsace and part of Lorraine; Breton in Brittany; Flemish in the northern corner of the Nord *département*; Provençal in the Alpes Maritimes, Basses-Alpes, Var and Bouches-du-Rhône *départements*; Catalan in Rous-

sillon (Pyrénées Orientales); Basque south of Bayonne, and Italian in Corsica. Religion: mainly Roman Catholic with c. a million Protestants and over 230,000 Jews. Chief towns (pop., 1946 census): Paris (cap., 2,725,374); Marseilles (636,264); Lyons (460,748); Toulouse (264,411); Bordeaux (253,751); Nice (211,165); Nantes (200,265). President of the republic, Vincent Auriol (*q.v.*); prime ministers in 1951, René Pleven, Henri Queuille (from March 9 to July 10) and again René Pleven.

History. During 1951 France had three governments. René Pleven (Union Démocratique et Socialiste de la Résistance), who had come into office on July 11, 1950, resigned on Feb. 28, 1951; Henri Queuille (Radical) was elected on March 9 and resigned on July 10 as soon as the new National Assembly, elected on June 17, had re-elected Edouard Herriot as its president. After an exceptionally long interregnum René Pleven was again elected prime minister on Aug. 8 and brought his government before the assembly on Aug. 12. Robert Schuman (Mouvement Républicain Populaire) was foreign minister throughout the year. Queuille was minister of the interior both in the first Pleven cabinet and in his own; Charles Brune (Radical) became minister of the interior under Pleven. Maurice Petsche (Independent) was minister of finance in Pleven's first government and in Queuille's and was succeeded by René Mayer (Radical). Jules Moch (Socialist) was minister of national defence in the first Pleven government and in Queuille's and was succeeded by Georges Bidault (M.R.P.).

There was a certain similarity between the beginning and the end of the year. Pleven was at both times in office and his government was on both occasions coaxing the assembly into passing additional taxation. At either end of the year the police, mobilized in strength, prevented a Communist demonstration in the Avenue des Champs Elysées. But these similarities were deceptive. The victory won over Communist violence in 1950 was maintained in 1951. The only serious outbreak of strikes was at Easter time in both Paris municipal and national transport; there was no degeneration into disorder. The main theme of the year was the attempt to prevent the rise of prices in face of constant inflationary pressure. In this the French government was less successful than those of other member states of Organization for European Economic Co-operation. A report on inflation issued by the council of that body (Nov. 27, 1951) noted that price increases were 50% higher in France than in other west European countries. The weak position of the successive governments faced with very divided assemblies was no doubt partly responsible for this. René Mayer on Nov. 14 had to paint a grim picture to the assembly of a budget in prospective deficit, of an adverse trade balance and a still graver deficit in dollars. But with the U.S. aid increased by \$250 million and

The French council of ministers seen with President Vincent Auriol (centre) at Rambouillet, the president's summer residence, Aug. 1951. The prime minister, René Plevén, is seen on the president's right shaking hands with René Mayer, minister of finance. On left, holding papers, is Robert Schuman, foreign minister.

an energetic attitude on the part of the government the situation looked somewhat more favourable at the beginning of December. The assembly was at least much further advanced with the next year's budget than had been its predecessor which had passed only the national defence section by the New Year and did not get the whole budget for 1951 into law till the night of May 24-25, when it was about to disperse for ever. The 1952 budget was also presented in a new form, much clearer and more succinct.

The Fall of the First Plevén Cabinet. Plevén began the year with some successes which might ordinarily have been expected to foreshadow continuance in office. On Dec. 29, 1950, the assembly had approved national defence credits at the new total of Fr. 740,000 million by 416 votes to 180 and on Dec. 31 new taxes for national defence amounting to Fr. 140,000 million by 331 votes to 135. On Jan. 17 Plevén was able to announce his visit to Washington. This was at a time when French public opinion was particularly anxious about relations with the United States, being divided between fear of an extension of the war in the far east and that of diverging so far from the U.S. views on the question of German rearmament as to lose some of the benefits of the U.S. assistance. The results of the visit to Washington (Jan. 29 and 30) were considered reassuring and more particularly a personal success for Plevén. On Feb. 14 the five-power conference to prepare a plan for a European army as proposed by Plevén in the previous year began to sit in Paris. But in internal politics Plevén was faced with the extremely difficult problem of preparing a new electoral law for elections to be held at the latest in October. This was described by Paul Reynaud, not without good reason, as a necessary measure of national defence. The proportional representation adopted for the elections of 1945 and maintained in 1946 was the system most favourable to a widely scattered party like the Communists and another election on this basis was likely to produce a parliament in which the parties of the republican coalition would be in a minority, as well as the Communists and the Gaullists—in which there would in fact be no majority at all and no possibility of forming a government.

That the country needed an electoral system less favourable to the Communists and more likely to produce a majority was common ground to all the parties of the majority, but there was no agreement as to what that system should be. The Radicals wished for the return of the prewar system, that is, single member constituencies with a second ballot if no candidate obtained an absolute majority at the first, thus enabling voters to support a second preference if their

preference had obviously no chance. The M.R.P. complained that this system too often ended in an anti-clerical alliance. They wanted a system with only one ballot and if possible a form of proportional representation. This was comprehensible since the existing system was as favourable to them as to the Communists. Now the M.R.P. and the Communists had together a majority in the assembly. Plevén proposed on behalf of the government to accept as the government's policy any electoral reform scheme approved by the majority of the majority, but unfortunately owing to the division between the M.R.P. and the Radicals, the majority of the majority was only a minority of the assembly. Plevén resigned on Feb. 28 when it became evident that his plan for getting agreement on electoral reform was only splitting the coalition more and more deeply.

The Second Queuille Cabinet. After ten days' negotiation Queuille was elected prime minister on March 9 with a programme to form a "hundred days' government" and hold elections early in June. The two cabinets were practically identical. The reason for holding elections at this date was first of all to wind up the assembly elected on Nov. 10, 1946, which was already so hag-ridden by the prospect of elections that it could do no useful work, and secondly to give the new assembly time to get into its stride early enough for the budget of 1952 to be voted by the end of 1951. It was not till May 7 that a compromise bill finally became law. The battle had been so severe that the prime minister's health gave serious ground for anxiety. The new law provided for the maintenance of the multi-member constituencies and voting for lists of candidates. In the Paris area pure proportional representation was maintained; elsewhere it was maintained only if neither one list of candidates, nor a group of lists, which had declared themselves to be in association (*apparentement*), gained an absolute majority. The list or group of associated lists which gained an absolute majority took all the seats, in the latter case dividing them proportionally amongst the jointly victorious lists. The point of this arrangement was that nowhere had the Communists allies with whom to enter into association, and that the Gaullists, owing to the nature of their programme, could only do so in a small number of departments. This left the advantage of "association" with its hope of an absolute majority (and therefore all the seats in a given constituency) to the parties of the republican majority. The disadvantage of the system was that the ordinary Frenchman expects to compromise in parliament rather than at the polls and was shocked to see anti-clerical Socialists, Catholic M.R.P. and Independents (Conservatives) appealing for his vote under a

system that was mutually advantageous, even though they maintained their identity and had separate lists. It also seemed odd that a party gaining only 20% of the votes, but forming part of a victorious "association" might win two or three seats whereas an isolated opponent winning 40% of votes might receive none.

Meanwhile the government was faced with one serious outbreak of strikes in the year, which began and ended with Paris passenger transport (19 days from March 16 to April 3) but which affected for a few days a large part of the French railways, gas and electricity and some other corporations. In the course of these strikes and threats of strikes the national minimum wage was raised from 78 to 87 francs an hour and the miners received an increase of about 12%.

After a last fortnight of embittered parliamentary business in which Queuille had to fight hard to keep vote-catching items off the agenda the budget in its final form nearly failed to be passed owing to a dispute between the M.R.P. and the Socialists as to whether it should include tax relief for Catholic schools (which received no public subsidy).

Meanwhile after long negotiations and in face of much scepticism in France itself as well as elsewhere an agreement had been reached on the basis of the Schuman plan with Belgium, the Netherlands, Luxembourg, Italy and Germany for the creation of a European steel and coal "community." In order that the Saar might be included and Germany also participate, the French signature was held to bind the Saar also and France agreed that the Saar should be represented on the assembly by 3 of its 18 seats. The treaty was signed on April 18.

The election campaign was calm but the polling was about 78%. The electoral law played strongly in favour of the "associated" parties so that the Socialists and the combined lists of Radicals and U.D.S.R. both lost votes and gained seats. Opinion had changed so profoundly that the election results were compared less with the results of 1946 than with intervening expectations. Thus the M.R.P. was thought to have done well because it did not lose even more to the Gaullists as it would have done in 1947 or 1948 and the Gaullists to have done not so well because they did not sweep 30% of the voters into their net as in the municipal elections three years earlier. (See ELECTIONS.)

The Second Plevin Cabinet. The elections gave 380 seats to members of the parties which had formed coalitions in the old assembly as against 224 to the two incompatible oppositions, Gaullist and Communist, but there were also 313 deputies from Gaullists to M.R.P. in favour of at last giving some financial assistance to Catholic schools, a proposal bitterly opposed by the Socialists and most of the Radicals as well as the Communists. The friends of the Catholic schools, already deeply committed, insisted that though theirs was not a majority that could govern, since on most other questions it was divided, it must be allowed to express itself in this one issue. The Socialists on the other hand insisted that any government they joined must prevent any breach of the lay school principle. The first consequence of this was that no government could be formed for 29 days after Queuille had resigned and that when Plevin was elected he had to form his government on a minority basis and stand by while the parties he wished to unite behind him tore themselves to pieces over a private member's bill giving about Fr. 12,000 million additional appropriation to the state schools in order also to give Fr. 4,000 million to the Catholic schools by a system so complicated (so that it might be arguably not a breach of the lay principle) that an administrative formula for putting it into effect had not yet been found in the first week of December.

When this had been voted on Sept. 10 the Socialists avenged themselves with an automatic sliding scale bill

which they got through the assembly with the help of Communists and Gaullists. Plevin's cabinet felt too weak to oppose it at this stage and continued the practice of government by self-effacement, hoping to modify it when it returned from the Council of the Republic (upper house) in December. It was not till the end of September that the new assembly, which had begun so inauspiciously, could be persuaded to go on holiday.

These weary wrangles were not all France's history at this time. General Alphonse Juin was at last released from his task as resident general of Morocco to assume the post of commander in chief of the North Atlantic Treaty forces in the central sector of the European theatre. The government meanwhile had to fight price increases and adjust wages to them. For the second time in the year the basic minimum wage was raised, this time from Fr. 86 an hour to Fr. 100—four points above the level required by a rigid interpretation of the index figure. War was opened on butchers, who tried closing their shops in protest against price-fixing but finally yielded to the government's policy. The government was at least successful in avoiding strikes which had been expected in the autumn, but the franc was seriously weakened on the free market. On Nov. 8 the bank rate which had been raised from 2½ to 3% on Oct. 11 went up to 4%. Meanwhile the government had taken the unpopular measure of raising the price of both petrol and tobacco by 20% to provide some immediate revenue for the treasury—a measure that would bring in about Fr. 70,000 million in a full year. On Nov. 16 the finance minister, René Mayer, told a depressed assembly that another Fr. 200,000 million taxes would be needed and that for lack of dollars the import programme from the

A memorial to three marshals of France, Ferdinand Foch (1851-1929), Joseph Jacques Césaire Joffre (1852-1931) and Joseph Simon Galliéni (1849-1916), which was unveiled by President Vincent Auriol at Saint-Gaudens, near Tarbes, France, in Oct. 1951.

dollar zone would have to be cut from \$850 million to \$500 million. This cut meant reduced import of coal, petrol and a number of other raw materials. The whole foreign trade position had been reversed so that exports covered only 64% of imports in the third quarter of the year instead of 81% in the first. A programme of austerity to meet the crisis did not gain the government votes. On Nov. 20 it had to be content with a majority of only 247 to 229 with the Socialists and half of the Peasant party abstaining. The latter party split a few days later, 20 of its members adopting a new name and passing into the wake of the Gaullist French People's rally. By the end of the month Mayer was able to announce that the United States had guaranteed an additional \$250 million in the U.S. budget year, \$130 million being probably available for Indochina but also at least \$120 million to increase the import programme especially of coal and petrol. The favourable vote of the assembly foreign affairs commission on the ratification of the Schuman plan, by 26 votes to 18, gave hope of a consolidation of the government majority.

There was naturally a good deal of speculation in the second half of the year as to whether a centre-right majority could not be formed including the Gaullists and without the Socialists. Although the general referred to other parties with greater cordiality than usual at the Nancy congress of his party in November, his claims to leadership, his ungracious references to the U.S. policy and his sharp opposition to both the Schuman and the Pleven plans were felt in most of the non-Gaullist right to make political co-operation still impossible.

On July 23, Philippe Pétain, the ex-marshal, died aged 95, still legally a prisoner but no longer in a fortress (*see*

René Pleven (right) greeting Winston Churchill during the latter's visit to Paris, Dec. 17-18, 1951.

OBITUARIES). Permission to live in an annex to a military hospital (in fact a private house so labelled) was given as soon as the elections were over. The treatment to be accorded to this very old man continued to cause bitter dissension till the end and even four months after his death a requiem mass in Notre Dame provoked a counter-demonstration. He was buried wearing his marshal's uniform in the churchyard of the Ile d'Yeu, where he had been imprisoned.

(D. R. Gr.)

Education. (1949-50) Elementary schools: state infant 3,726, pupils 446,947; private infant 188, pupils 23,116; state elementary 69,843, pupils 3,775,775; private elementary 11,028, pupils 886,948; state higher elementary, pupils 192,801; private higher elementary, pupils 58,916; total elementary 84,785, pupils 5,384,503. Secondary schools: boys' 588, pupils 225,000; girls' 395, pupils 187,000; total 983, pupils 412,000. Lower technical and vocational schools numbered more than 220 with over 200,000 pupils in 1949. Higher education: state universities 17, students (July 31, 1950) 136,744, including 39,056 in the law faculties. There were 10 other state institutions of higher education, 6 free (Catholic) universities and more than 80 state and private institutions of higher technical education.

Agriculture. Tables I, II and III show respectively the production of main crops, the amount of livestock, and the production of certain foodstuffs.

TABLE I. AGRICULTURAL PRODUCTION ('000 metric tons)

	1934-38 av.	1946	1948	1949	1950	1951
Wheat	8,143	6,759	7,634	8,082	7,701	7,028
Rye	769	462	638	650	606	504
Barley	1,074	1,063	1,273	1,431	1,572	1,667
Oats	4,572	3,771	3,380	3,225	3,305	3,602
Maize	541	211	461	194	404	612
Potatoes	17,158	9,882	17,544	10,976	14,431	12,093

1951 was a somewhat poor year for agriculture. Wheat production was 15% less and that of potatoes 30% less than the average of 1934-38.

TABLE II. LIVESTOCK ('000 head)

	Nov. 1938	Nov. 1945	Sept. 1949	Sept. 1950
Cattle	15,622	14,272	15,434	15,432
Pigs	7,127	4,386	6,424	6,760
Sheep	9,872	6,700	7,511	7,480
Goats	1,416	1,146	1,236	1,283
Horses	2,692	2,258	2,418	2,414

TABLE III. FOODSTUFFS ('000 metric tons)

	1934-38 av.	1946	1948	1949	1950
Meat	1,660	1,250	1,500	1,805	1,901
Milk ('000 hl.)	141,000	106,000	112,000	125,000	—
Butter	202	152	160	183	225
Cheese	270	160	190	—	—
Sugar, raw value	971	765	960	881	1,434

France is the world's largest producer and consumer of wine. In 1938 its share in world wine production was about 40%, immediately after World War II 25%, and in 1950 again reached 40%.

TABLE IV. WINE: PRODUCTION, IMPORT AND EXPORT ('000 hl.)

	1938	1946	1948	1949	1950	1951
Produced	60,332	36,160	47,437	42,935	65,132	47,329
Imported*	16,257	9,273	9,894	10,302	12,028	11,000
Exported†	1,032	729	620	743	982	632

* Mainly from Algeria. † Mainly champagnes, clarets and Burgundies.

In the years 1934-38 the average consumption of wine per head was about 160 litres; in 1945-48 it decreased to approximately 110 l., and in 1950 amounted to about 130 l. The yearly consumption of pure alcohol per person in every form (*apéritifs*, wine, liqueurs, brandy, etc.) was in 1950 22.5 l., compared with 4.1 l. in Britain and 3.3 l. in

TABLE V. INDUSTRIAL PRODUCTION* ('000 metric tons if not otherwise stated)

	1938	1946	1950	1951†
Coal	47,600	47,200	53,884	55,000
Gas (million cu.m.)	1,692	2,448	2,424	2,400
Electricity (million kwh.)	20,800	23,000	33,390	37,900
Iron ore (33% metal content)	33,180	16,212	29,988	33,600
Pig iron	6,012	3,444	7,764	8,640
Steel ingots and castings	6,216	4,404	8,652	9,832
Cement	4,106	3,864	7,416	8,100
Motor vehicles { Cars	182,400	30,120	257,280	313,900
{ Commercial	39,360	62,520	99,360	132,000

Rayon staple fibre	5.6	17.3	38.6	50

* Excluding the Saar. † Annual estimates based on first nine months.

the United States. By the end of 1950 there were in France 284,142 licensed premises (*débits de boisson*): one per 148 inhabitants.

Industry. According to the 1946 census, there were 6,184,000 persons employed in industry as against 6,295,000 in 1936. The 1948 index number of employment in manufacturing was 98 (1937=100), the mid-1951 index number stood at 117 compared with 151 in the United States. The index number of industrial production rose between 1946 and 1950 from 73 to 113 and in mid-1951 stood at 131 compared with 197 in the United States.

In 1950 the number of dwelling units built amounted to 68,050, including 30,120 repaired. From Jan. 1945 to Dec. 1950 only 174,900 dwelling units, including 64,655 repaired, were built. The index number of housing (number of dwellings built per year per 1,000 inhabitants) in 1950 was 1.7 compared with 5.0 for the United Kingdom and 6.7 for the United States.

Foreign Trade. In Table VI imports and exports are given in actual values (million current francs) and, in brackets, in the index numbers of quantum, that is, after allowing for changes in prices which had occurred since the base year (1949=100).

TABLE VI. FOREIGN TRADE* (Fr. million)

	1949	1950	1951
Imports	921,794 (100)	1,072,728 (103)	1,599,000 (115)
Exports	782,022 (100)	1,072,644 (133)	1,480,000 (161)
Adverse balance	139,772	84	119,000

* Including the Saar.

Main sources of imports (1950; 1951, six months, in brackets): French Union 26.2%, U.S. 12.3% (13.7%), Western Germany 6.6% (6.7%), Australia and New Zealand 5% (7.8%), Belgium-Luxembourg 4.6% (5.4%), U.K. 3.7% (4.4%). Main destinations of exports: French Union 36.2%, U.K. 9.2% (15.6%), Western Germany 7.9% (8%), Belgium-Luxembourg 6.4% (9.7%), Switzerland 5.1% (9.2%), U.S. 4% (13.7%).

Transport and Communications. Railways (1950): 41,272 km. including 4,026 electrified. Railway traffic (monthly average, 1950; 1949 in brackets): passenger-km. 2,200 (2,456) million; goods ton-km. 3,244 (3,420) million; goods transported 12.7 (13.4) million metric tons. Roads (1950): 715,696 km. including 80,231 km. of first class national roads. Motor vehicles licensed (Jan. 1950): 2,295,000 including 572,800 commercial. Navigable inland waterways (1948): 8,488 km.; cargo (monthly average, '000 metric tons, 1950; 1949 in brackets): loaded 2,986 (2,794), unloaded 2,865 (2,852). Shipping (Jan. 1951; Sept. 1939 in brackets): merchant vessels 733 (670), gross tonnage 3,080,000 (2,733,633). The total included 75 emergency "Liberty" ships and 188 ships more than 20 years old. Ships entered (monthly average, '000 NRT, 1950; 1949 in brackets): 2,857 (3,043); cargo in external trade (monthly average, '000 metric tons, 1950; 1949 in brackets): loaded 1,562 (1,234), unloaded 2,586 (2,969). Civil aviation traffic, Air France only (monthly average, 1950; 1949 in brackets): passenger-km. 93.2 (82.1) million; cargo ton-km. 3.9 (3.3) million. Telephones (Jan. 1950): 2,318,673 including 1,411,678 (60.9%) automatic. Wireless receiving set licences (1947): 5,728,000.

Finance and Banking. Table VII gives the postwar budget figures with the last prewar budget as a measure of comparison.

TABLE VII. REVENUE AND EXPENDITURE (Fr. '000 million)

	1938*	1946*	1949†	1950†	1951†	1952†
Revenue	53.8	815.6	1,440.0	2,218.0	2,104.0	3,500.0
Expenditure	52.2‡	1,286.9	1,870.0	2,217.5	2,648.0	3,473.0
Deficit or surplus	+1.6	-471.3	-430.0	+0.5	-544.0	

* Actual. † Estimates. ‡ Excluding extraordinary expenditure for defence.

National income ('000 million, 1950; 1949 in brackets): 7,395 (6,530). Public debt ('000 million): internal (Sept. 1, 1939) 432.6, (Sept. 30, 1949) 2,662.9; external (Sept. 30, 1949) 1,181.9. Currency circulation ('000 million, end of the year): (1938) 112, (1950) 1,590, (1951) 1,842. Deposit money ('000 million, end of the year): (1938) 80, (1950) 1,530, (Oct. 31, 1951) 1,723. Official exchange rates: £1 = Fr. 980; \$1 = Fr. 350.

FRANCO-BAHAMONDE, FRANCISCO, Spanish army officer and statesman (b. El Ferrol, Galicia, Dec. 4, 1892), head of the Spanish state since 1939. For earlier career see *Britannica Book of the Year, 1951*. In a Columbia Broadcasting system interview on Dec. 31, 1950, Franco asked that Spain be included in the West's plans for containing

Communism, and in March he told Stanton Griffis, the newly appointed U.S. ambassador, that Spain was ready to send troops to serve under General Dwight D. Eisenhower, supreme commander, Europe. Despite opposition from Great Britain and France to Spain's inclusion in the North Atlantic Treaty organization, these approaches led in July to the exploratory mission to Franco of the late Admiral Forrest Sherman, U.S. chief of naval operations. In an interview in the *New York Times* on Aug. 6 Franco showed that he was acutely aware of the British and French attitude, but declared that when the common danger caused strategic values to conquer political hesitations, Spain was ready to send an expeditionary force to take part in the common defence against any Communist thrust in Europe. "There is no neutralism in Spain," he said. He had to deal in the spring of 1951 with strikes and riots in various parts of Spain caused by seasonal unemployment and rising living costs; penalties imposed on the strikers were remitted by Franco in October. Four bullet-proof cars on Rolls-Royce chassis were built in London for Franco in 1951.

FREEMASONRY. Following the death of the grand master, the Duke of Devonshire, the deputy grand master, the Earl of Scarbrough, was elected to the vacant position at the March quarterly communication, and he chose the Earl of Derby as deputy grand master. King George VI, the only past grand master in Europe, announced his intention of performing the installation ceremony, which was fixed to take place at the Albert hall, London, on Nov. 6. Six weeks before this date the King was operated upon for lung resection and, by his command, the Earl of Derby acted in his stead.

Nearly 8,000 saw the ceremony, among them being 26 reigning masters of grand lodges in Europe, the Commonwealth and the United States; and, to mark the occasion, the newly installed grand master announced the conferment of honours additional to those provided by the book of constitutions. Five grand masters gave an address to Lord Scarbrough after he had taken his place on the great gilt throne that had been used since 1791. They included Rudolph R. Cooke, of the Grand Lodge of Virginia, who, speaking on behalf of 3.5 million freemasons in the United States, said that the two countries had a common language, a common law, a common heritage and, among other things, a common respect for freedom and justice.

At the June quarterly communication, Grand Lodge adopted a recommendation that no ritual of any grand lodge which worked in a language other than English be demonstrated in any lodge (in England) without express permission of the Board of General Purposes. (E. BA.)

FRENCH EQUATORIAL AFRICA. Federation of four colonies, described from 1946 as overseas territories of the French Union, situated in central Africa and bounded W. by the Atlantic ocean, Nigeria and French West Africa, N. by Libya, E. by the Anglo-Egyptian Sudan and S.E. by the Belgian Congo. The southeastern part of the former German colony of Kamerun (Cameroun), under French trusteeship, is administered with the A.E.F. (Afrique Equatoriale Française). Areas and populations are:

	Area (sq. mi.)	Population (1936 census) (1946 census)	
Gabon	103,089	409,700	422,904
Middle Congo	132,046	746,800	631,151
Ubanghi-Shari	238,224	833,900	1,065,390
Chad	495,752	1,432,600	2,011,494
	969,111	3,423,000	4,130,939
Cameroun	170,231	2,389,500	2,819,800

Total pop. (1950 est.) 4,346,000 incl. 17,440 Europeans

(5,825 French); Cameroun pop. est. 3,006,000, incl. 7,536 French. Natives mainly Bantu, but semi-Hamitic semi-Negroid pastoralists in northern savannah districts. Religion: animism; Chad, Moslem 46%; c. 280,000 Christians in the Gabon and the Middle Congo. Chief towns: Brazzaville, capital of the A.E.F. (pop., mid-1949 est., 83,579, incl. 4,353 Europeans); Bangui (1948 est., 41,000); Fort Lamy (18,300); Libreville (12,600); Yaoundé, capital of the Cameroun (1946 est., 50,000). High commissioner in the A.E.F., Governor General Paul Chauvet. Governors: Gabon, Pierre Pellieu; Middle Congo, Hippolyte Le Layec; Ubanghi-Shari, Louis Grimald; Chad, Ignace Colombani. High commissioner in the Cameroun, André Soucadaux.

History. The elections of June 17, 1951, brought no important changes in A.E.F. representation in the French National Assembly, except that the Chad sent three Gaullist members. The double-college system was kept, with eight deputies for the natives and three for the Europeans.

The financial situation of A.E.F. was thought so precarious as to require a limitation of expenditure. The balance of trade showed a large deficit. Gold production tended to fall because of low prices throughout the world. Cotton, constituting 40% of exports, suffered from the instability of prices; the yield was low, and cultivation impoverished the soil. Output of diamonds, sisal, coffee and tobacco increased. Fisheries provided 1,402 whales in 1950. In the Gabon 221,000 metric tons of *okoumé* (light mahogany) came from the forests, and traces of petrol were found on the Middle Ogooué; but there was a shortage of labour in this territory, and the introduction of workers from Nigeria was still far from proving a success. The road-building programme called for revision, as being too ambitious for so vast and so thinly populated a country (in 1950 the density was only 4.5 per sq.mi.). Meat from the Chad for the Middle Congo had to be transported by air (450 metric tons in 1951).

The Cameroun was smaller, and development better concentrated—around the ports, so that the territory seemed markedly more prosperous. It was decided to link the western and central regions by a 1,800-m. bridge across the Vouri. At the same time work was begun on a heavy-traffic road to link Douala and Yaoundé via Edéa; "Douala," declared High Commissioner Soucadaux, "will no longer be an island." The two railways were to be modernized. The Edéa dam on the Sanaga progressed. The port of Douala handled 500,000 metric tons in 1950; it was hoped, with the new quays under construction, to provide seven berths for ships and to handle 1 million metric tons of merchandise.

Education. Schools (1950). *A.E.F.*: pupils, primary 67,000, secondary 1,200, technical 2,350, bursaries in France 181. *Cameroun*: pupils, primary 128,000, secondary 1,060, bursaries in France 142.

Foreign Trade. (1950, million Fr. C.F.A.). *A.E.F.* Imports 13,393, including 9,080 from the French Union; exports 7,277, including 5,340 to the French Union. Principal exports: cotton 2,755; timber 1,974; coffee 574; gold 346; diamonds 223; almonds and palm oil 320; cocoa 110. *Cameroun*. Imports 10,564, including 8,950 from the French Union; exports 8,190, including 4,969 to the French Union. Principal exports: cocoa 3,977; coffee 1,082; bananas 1,022; almonds and palm oil 986; timber 410; rubber 126.

Transport and Communications. (1950). *A.E.F.*: railways 512 km.; roads 9,000; tracks 29,000; motor vehicles 10,300; ships entered (all ports) 700; aircraft landed 1,026. *Cameroun*: railways 505 km.; roads 8,000; motor vehicles 7,000; ships entered 683; aircraft landed 1,072.

Finance. *A.E.F.*: budget (1952 est.), balanced at Fr. C.F.A. 8,700 million. *Cameroun*: budget (1951 est.), balanced at Fr. C.F.A. 4,682 million. Franc C.F.A. (Colonies Françaises d'Afrique)=metropolitan Fr. 2.

See *Encyclopédie Maritime et Coloniale: Afrique Equatoriale Française* (Paris, 1951).

(HU. DE.)

FRENCH GUIANA. Former colony on the N.E. coast of South America, the status of which was changed in 1946 to that of an overseas *département*. Area, incl. territory of Inini (30,301 sq.mi.): 34,740 sq.mi. Pop. (1936 census):

23,828, excl. Inini; (1946 census) 28,506, incl. Inini (4,993). The coastal lowland population is Negro or mixed; Inini, aboriginal Indians; Europeans c. 5%. Religion: mainly Roman Catholic. Capital and chief port, Cayenne (pop., 1948 est., 10,961). Prefect, Robert Vignon.

History. The *département* was divided into two *arrondissements*: that of Cayenne, comprising all the coastal communes; and that of Inini, covering the whole forest of the hinterland, which is almost uninhabited and requires special organization. In the elections to the National Assembly in Paris the deputy going out, a Socialist, was replaced by a Gaullist. Three Gaullists, three Radicals and one Independent were elected to the local general council. Efforts were made by France towards lifting the *département* out of its stagnation. An Institute of Tropical America was set up at Cayenne. Prospecting for gold and bauxite went on. A wharf was to be constructed. Displaced persons were established at Saint-Laurent-du-Maroni, as well as an ethnographic and medical service responsible for the Indians. Several missions reached the Tumuc Humac region. A geological map was drawn up.

Education. One school per commune; a college at Cayenne.

Transport and Communications. Roads 36 km.; motor vehicles 250. Movement is almost all by sea and by river.

Foreign Trade (1950, million metropolitan Fr.): imports 1,393, including 1,070 from the French Union; exports 210 (incl. gold 160, timber 24).

(HU. DE.)

FRENCH INDIA. Group of four settlements in India with a total area of 193 sq.mi. Pop. (1948 est.): 317,000. The Bengali-speaking Chandernagore (4 sq.mi.; pop. 44,800) was transferred to India on May 2, 1950. The four Tamil-speaking southern settlements are:

	Area (sq.mi.)	Population (1938 est.)	(1948 est.)
Pondicherry	112	181,000	222,600
Karikal	52	62,500	70,500
Mahé	23	13,400	18,300
Yanaon	6	5,400	5,900

Chief town and seat of administration, Pondicherry (pop., 1948 est., 22,572). Commissioner, André Ménard.

History. The treaty yielding Chandernagore to India was ratified on Feb. 2. Neutral observers sent by the International Court of Justice came to inspect the conditions under which the future referendum would be held in the four settlements. They reported favourably on the French administration.

In the elections of June 17, 1951, a member who had stood for reunion with India was replaced as deputy to the French National Assembly by a supporter of the policy of remaining within the French Union.

Thanks to imports of rice from Indochina, French India did not suffer from food shortages as independent India did. Its balance of trade showed a surplus. The textile industry provided its exports. A new electricity generating station, the construction of which was subsidized by France, was opened at Pondicherry.

Education. Schools (1950): pupils, primary 15,892; secondary 894; higher 79; bursaries in France 21.

Finance. Budget (1951 est.): balanced at Rs. 9 million. Monetary unit: *rupee*=metropolitan Fr. 73.50.

(HU. DE.)

FRENCH LITERATURE. The gradual drift away from the Sartrian school of "engaged" or committed literature, which began to be noticeable just before 1950, found the French literary bark of 1951 headed for the open sea, well outside the comfortable waters of dogma and schools, with no clearly defined currents in sight.

In the domain of the novel, an occasional breaker, such as Julien Gracq's Chirico-like political allegory *Le Rivage des Syrtes* (Prix Goncourt), or Pieyre André de Mandriargue's collection of *nouvelles*, *Soleil des loups* (Prix des Critiques),

seemed to augur a resurgence of surrealism; and the excited rediscovery of Victor Hugo by a number of younger critics was accompanied by such echoes of 19th-century romanticism as Anne de Tourville's *Jabadao* (Prix Fémina) or Marcel Schneider's *La Première Ile*. Quite unexpectedly (his own translation of an earlier work, *Murphy*, having attracted little attention when it appeared a few years back), the Irishman Samuel Beckett, long a French resident, leaving well behind him the relatively indulgent "blackness" of his immediate progenitors James Joyce, Franz Kafka and Jean-Paul Sartre, made a considerable stir with two books written in French, *Malloy* and *Malone meurt* which, by means of a brilliantly directed technique of assertion and retraction, expressed human personality in terms of a stream of semi-conscious and frequently cloacal babble. There was little indication, however, despite the high praise accorded in certain critical circles to both these works, that they would attract disciples among native French writers. Robert Margerit's *Le Dieu nu* (Prix Théophraste Renaudot) offered a purely psychological analysis in the 18th-century tradition, and Louise de Vilmorin's two popular little tales, *Julietta* and *Madame de*, the latter high on several prize lists, were finely executed vignettes of the contemporary Parisian *mondaine*. It was, in fact, generally conceded, even by the most exacting critics, that, although the important literary renaissance predicted by many just after World War II could not be said to have taken place, there was evidence of greater attention to style, increased variety of theme and treatment and, above all, a more abundant output of well-written novels than at any time since 1945. Among more than 30 that received favourable critical attention may be mentioned: *Cherchant qui dévorer*, by the Catholic Luc Estang; *Rage blanche*, the second volume of Jean Hougron's Indochinese trilogy; *Les Fruits du Congo*, a story of childhood fantasy by Alexandre Vialatte, the French translator of Franz Kafka; *Fin*, an emotional analysis somewhat in the manner of Virginia Woolf, by Gilbert Sigaux; and *La Clé*, by Yassu Gauclère. It should not be forgotten, either, that 1951 saw the appearance of new novels by a number of representative older writers—Claude Farrère, Pierre Benoit, André Maurois, François Mauriac, Jules Romains, Georges Duhamel, Paul Morand, and others—also the publication of the "complete works" of Colette, Valéry Larbaud, François Mauriac, André Maurois, Jacques Chardonne and Jean Genêt. A review entitled *Roman*, entirely devoted to the problems of the novel, was being edited from Venice. In other words: "roman pas mort," despite the very evident passing of the so-called "roman noir."

For the poets, despite the unusual event of a poets' congress (held in Belgium under the auspices of the *Journal des Poètes*, with Jean Cassou presiding), the year was more one of probing recapitulation than inspiration. In addition to a collection of his own prewar poems, Paul Eluard published an original *Première Anthologie vivante de la poésie du passé*; Jules Supervielle in *Naissances* and René Char in *A une Sérénité crispée* sought to penetrate the secrets of poetic creation; finally, Pierre Reverdy and Pierre MacOrlan were intelligently enshrined in volumes 25 and 26 of Pierre Seghers' excellent series *Poètes d'aujourd'hui*. Under the title *Poètes contemporains*, Léon-Gabriel Gros published a volume of essays on the work of some 15 poets who may be said to have marked the second quarter of the century. Among works by the much younger poets, *Air*, by André du Bouchet, and *Langue morte*, by Alain Bosquet, revealed authentic talents of distinction.

In the French theatre, 1951 seemed likely to be remembered as the year of Jean-Paul Sartre's *Le Diable et le Bon Dieu* and Jean Cocteau's *Bacchus*, both set in the Germany of the Reformation and both presenting, in dramatic form, the

essence of these authors' philosophy. This was also true of Georges Schéhadé's tenderly poetic *Monsieur Bob'le*, with the difference that the latter play was set against a background and in a period that, although more approaching our own, were still purely imaginary. *Colombe*, by Jean Anouilh, and *Lorsque l'Enfant paraît*, by André Roussin, were among the better new plays of the year which, from the literary point of view, was considered by many to be exceptionally meagre.

The list of essays was not so long as in preceding years. It contained, however, a number of important titles: *Petite Préface à toute critique*, by Jean Paulhan; *Les Voix du silence*, by André Malraux (a greatly revised version of his *Musée imaginaire*); Albert Camus' much-discussed *L'Homme révolté*; and a posthumous study by Simone Weil, *La Condition ouvrière*. Among the philosophers, Jean Wahl published a volume of his Sorbonne lectures on *La Pensée de l'existence*; Gaston Bachelard discussed *L'Activité rationaliste de la physique contemporaine*; Louis Lavelle (who died in September) discussed sainthood in a volume entitled *Quatre Saints*; and the German-born Eric Weil brought out an authoritative volume, *Hegel et l'état*, in addition to his doctor's thesis entitled *Logique de la philosophie*. In the related fields of aesthetics, psychology, sociology, ethnology, history and the sciences, the activity was so great as to render impossible anything other than the mention of this fact. There were, also, a number of works of immediate, topical interest that were much discussed: *Visa pour Moscou*, by Michel Gordey; *Réflexions politiques (1932-1952)*, by Hubert Beuve-Méry, editor of *Le Monde*; *La Guerre en question*, by Jules Monnerot; *Les Guerres en chaîne*, by Raymond Aron; *Où va le peuple américain?* (vol. II), by Daniel Guérin; and *La Chine*, by Jean-Jacques Brieux.

The death of André Gide at 82 (see OBITUARIES) was marked by a special memorial issue of the former *Nouvelle Revue Française* (of which he was a founder), and by several other volumes of appreciation and reminiscences. His intimates could only deplore the fact that an unauthorized commercial distribution of the fragment of his *Journal* that touched upon his marriage (under the title *Nunc manet in te*) should have surrounded his death with much the same atmosphere of scandal and dissension that had so frequently surrounded him in life. Others who died during the year were: the philosopher Alain (see OBITUARIES), the dramatists Henri-René Lenormand (see OBITUARIES) and Robert de Traz, the novelist Maxime van der Meersch and the poet and literary historian Léo Larguier.

More than a dozen well-edited literary reviews and weekly newspapers continued to promote discussion and criticism. (See also LITERARY PRIZES.) (M. JOL.)

FRENCH SOMALILAND. Former colony situated in the Gulf of Aden the status of which was changed in 1946 to that of overseas territory, bounded N. by Eritrea, N.W. and S.W. by Ethiopia and S.E. by British Somaliland. Area: 8,376 sq.mi. Pop.: (1936 census) 46,391; (1948 est.) 56,000. Natives included 21,000 Danakilis, 15,700 Somalilis and 5,600 Arabs. Europeans 2,000, incl. 1,260 French. Capital, Jibuti (pop., 1949 est., 22,000). Governor, Numa Sadoul.

History. In the elections of June 17, 1951, for the National assembly in Paris, the deputy going out, a Socialist, was replaced by a Gaullist. Work on the port and on the street-plan of Jibuti was continued. Steps were taken towards establishing centres of cultivation in the hinterland, with a view to settling nomads. The new local assembly, based on a better distribution of seats amongst the various peoples, seemed to have given satisfaction. There were no reports of disturbances.

Education. Schools (1950): primary 7, pupils 870.

Foreign Trade. (1950, million Jibuti francs): imports 2,720; exports 1,383 (coffee treated on the spot and re-exported, 963; sea salt 91).

Transport and Communications. (1950) Roads 400 km.; motor vehicles 500. Traffic handled by the port of Jibuti, 460,000 metric tons.

Finance. Budget (1951 est.): balanced at J.Fr. 539 million. Jibuti franc = metropolitan Fr. 1.64.

FRENCH UNION. With the establishment, by the constitution of 1946, of the French Union, in which are comprised both the mother country and the former empire, the old colonial terminology was abolished and for the colonies were substituted four categories of overseas regions. The older, completely assimilated colonies claimed recognition as French *départements* administered as in the mother country; the others became overseas territories (*territoires d'outre-mer*) which henceforward would elect representatives to parliament and would have their own local assemblies possessed of wide powers; the trust territories, to be known in future as *territoires associés*, were similar in structure to the overseas territories and had the same electoral privileges; lastly, there were the former protectorates, now styled *états associés*, which could belong to the union only by an act of voluntary accession. Total area of the overseas territories of the French Union: approximately 4,593,085 sq.mi.; total

population (1948 est.): 78.7 million. Certain essential information on the component parts of the French Union is given in the table. (See also separate articles).

History. The constitutional organs that cover at the same time the French Republic and the associated states were by 1951 set up. On Nov. 29 the High Council met for the first time in Paris, with Vietnam, Cambodia and Laos taking part. The Assembly of the Union continued to demand real powers instead of the purely consultative function that it in fact had. Albert Sarraut, a former prime minister and colonial minister, became president of this assembly in the place of Jacques Fourcade, who had been elected deputy.

Tunisia and Morocco still refused to take part in these institutions, which they thought prejudicial to their independence. In Tunisia the Neo-Destour party joined the government in order to obtain reforms tending towards autonomy. In Morocco the intransigence of the Istiqlal led to conflict with the resident general, and the sultan had to disown the Nationalists.

On May 24 the French National Assembly (for France and the overseas *départements* and territories) voted an electoral law giving the territories the right to 43 deputies (1 for every 800,000 inhabitants) and enlarging the number

* 1948 estimate if not otherwise stated. † 1949 estimate. ‡ 1946 census.

of electors by admitting heads of families who pay taxes and mothers of two children. Including Algeria and the *départements*, overseas deputies in 1951 numbered 80. The elections of June 17 resulted in a strengthening of the parties of the centre and the right, as in France. The Algerian elections were contested by the Nationalist parties. In French West Africa the Rassemblement Démocratique Africain lost seats and renounced its Communist affiliation.

Administration was still divided between the Ministry of the Interior (Algeria and the overseas *départements*), the Ministry of Foreign Affairs (Tunisia and Morocco), the Ministry of France Overseas (the territories) and the Ministry for Associated States (Vietnam, Cambodia and Laos).

Considerable sums of money were assigned to industrialization and development in overseas countries, whether under the Monnet plan in the case of North Africa or by the Investment Fund for Economic and Social Development (F.I.D.E.S. or Fond d'Investissement pour le Développement Économique et Social). The latter, which was devoted to the territories, had by 1951 invested Fr. 250,000 million, of which a large proportion was derived from France and the remainder from the territories themselves or from the European Recovery programme. Two-thirds of this money went to installations: harbours (notably that at Abidjan, inaugurated in 1951), roads, railways, electricity, town-planning. A new tendency towards limiting credits for roads so as to be able to increase production was remarked. Expenditure on social services (education and health) accounted for 10% of the investments.

See H. Deschamps, *L'Union Française: histoire, institutions, réalités* (Paris, 1951-52); Ministère de la France d'Outremer, *L'Équipement des territoires français d'outremer* (Paris, 1951). (HU. DE.)

FRENCH WEST AFRICA. Group of eight colonies, described from 1946 as overseas territories of the French Union, situated in western Africa and bounded W. and S. by the Atlantic ocean, N. by the Spanish Sahara, the Southern territories of Algeria and the Fezzan, and E. by Chad and Nigeria. The group is administered by a high commissioner assisted by a council of government composed of civil and military leaders and a Grand Council consisting of metropolitan members and Africans elected by the territorial assemblies in the proportion of five per territory. The eastern part of the former German colony of Togo, under French trusteeship, is administered with the A.O.F. (Afrique Occidentale Française). Areas and populations are:

	(Area (sq. mi.)	Population	
		(1936 census)	(1948 est.)
Mauritania . . .	364,092	383,000	524,000
Senegal	81,081	1,791,000	1,994,000
Sudan	461,389	3,569,000	3,137,000
Upper Volta* . . .	121,892	—	3,044,000
Niger	493,822	1,747,000	2,041,000
Ivory Coast	129,807	3,850,000	2,031,000
French Guinea . . .	108,455	2,011,000	2,130,000
Dahomey	44,749	1,351,000	1,474,000
	1,805,287	14,702,000	16,375,000
Togoland	20,463	781,000	953,000

* Territory of Upper Volta was formed on Jan. 4, 1947, from parts of Sudan, Ivory Coast and Niger.

Population: mainly Negro, but in the savannah lands there is some Arab and Berber admixture; European (1948), 51,760 (including about 40,000 French) in the A.O.F., 841 in Togoland. Religion: animists estimated at 53.4%, Moslems 44.2% and Christians 2.4%. Chief towns (pop., 1948 est. if not otherwise stated): Dakar, capital of the A.O.F. (1951 est. 330,000); Saint-Louis (62,900); Bamako (70,492); Conakry (38,000); Abidjan (36,000); Porto Novo (31,000); Lomé, capital of Togoland (30,100). High commissioner in the A.O.F., Governor General Bernard Cornut-Gentile. Governors: Mauritania, Marie Rogué; Senegal, Camille

Bailly; Sudan, Edmond Louveau; Upper Volta, Albert Mouragues; Niger, Jean Toby; Ivory Coast, Lucien Gay; French Guinea, Paul Sirix; Dahomey, Charles Bonfils; Togoland, Yves Digo.

History. The elections on June 17, 1951, to the French National Assembly in Paris were notable for an advance made by the moderate elements. Out of 21 seats, the extremists of the Rassemblement Démocratique Africain (which shortly before had renounced its Communist affiliation) got only 2; their leader, Félix Houphouët-Boigny, was re-elected in the Ivory Coast. Lamine Gueye, a Socialist deputy and the president of the French West African Grand Council, was thoroughly beaten in Senegal by Sedar Senghor's list (overseas independent). All the deputies were natives.

In Togoland the Parti Togolais du Progrès was clearly ahead of the Comité de l'Union Togolaise, which supported Ewe autonomy. In the permanent consultative commission for Togo affairs all the delegates from French Togoland opposed the setting-up of an Ewe state and the unification of the two Togolands.

On his being elected deputy, High Commissioner Paul Béchard was succeeded by Cornut-Gentile.

On Feb. 5 the harbour of Abidjan, capital of the Ivory Coast, was inaugurated. A canal 2,700 m. long, 300 m. wide and from 10 to 20 m. deep leads from the sea to the inner lagoon, where ships can find depths of 12-26 m. Abidjan is the terminus of the Ivory Coast and Upper Volta railway and is also the centre of the coastal lagoons which, on completion of the two canals, would connect 300 km. of coast.

Town-planning operations (avenues, squares, skyscrapers and water supply) changed the appearance of Dakar and prepared for the extension of the Grand Dakar. In 1951 there were 330,000 inhabitants (cf. 131,000 in 1939), including 30,000 Europeans. Reckoned by the number of ships entering, Dakar was the third port of the French Union, after Marseilles and Le Havre. Nine ships could refuel there at once, and 25 aircraft land every day at the airport at Yoff.

In Casamance experiments were made on the mechanized cultivation of groundnuts. The Ziguinchor-Bathurst road was opened. On the lower Senegal, in the Richard Toll area, a vast lacustrine depression (the Lac de Guiers) was to be adapted for rice-growing.

New mineral deposits were found: copper at Akjoujt (Mauritania); high-grade iron at Fort Gouraud (Mauritanian Sahara); and tin in the Air (a Saharan region of the Niger).

Education. Schools (1950) (A.O.F., state, primary 827, pupils 99,000; secondary 66, pupils 6,610; technical, pupils 1,200; private 237, pupils 33,000; higher, Institut des Hautes Etudes de Dakar; bursaries in France, 900. *Togo*, pupils, elementary 37,000, secondary 700, technical 200.

Foreign Trade. (1950, million Fr. C.F.A.): A.O.F.: imports 42,400, including 31,930 from the French Union; exports 31,000, including 24,540 to the French Union. Principal exports (million Fr. C.F.A.): groundnuts, oil-cake and groundnut oil 11,550; palm kernels and palm oil 3,000; coffee 7,000; cocoa 4,600; bananas 1,000; timber 650. *Togo*: imports 1,600, incl. 1,070 from the F.U.; exports 1,500, incl. 860 to the F.U.

Transport and Communications. (A.O.F. and *Togo*, 1950): Railways 4,370 km.; roads 79,000 km., including only 25,000 km. passable to vehicles in all weathers. Ships entered (all ports), 3,944.

Finance. Budget (1951 est.): A.O.F., balanced at Fr. C.F.A. 27,234 million; *Togo*, balanced at Fr. C.F.A. 650 million. Franc C.F.A. (Colonies Françaises d'Afrique) = metropolitan Fr. 2. (HU. DE.)

FRIENDS, THE RELIGIOUS SOCIETY OF.

Membership in London Yearly meeting, which includes Friends in Great Britain, Australia and New Zealand, increased by 19 to 21,988 in 1951. Of this number 20,795 were in Great Britain. Friends in Ireland Yearly meeting (the republic and Northern Ireland) increased by 13 to 1,977, and there were about 250 Friends in India and 180 in

South Africa. In Europe, the largest group of Friends was that in Germany, which numbered over 500 members, besides others known as "friends of the Friends."

Quakers in Britain, the United States and Europe gave much attention to the problem of east-west tension and, while a group in America produced proposals for U.S. foreign policy, called "Steps to Peace," British Friends sent a mission of seven to the U.S.S.R. in July. During a fortnight's stay the visitors talked with leaders of the Russian Orthodox Church and Baptist Evangelicals, and with editors, scientists and public men. In a three-hour interview with Yakov Malik, a deputy foreign minister of the U.S.S.R., they asked the Soviet government to take the initiative in easing the tension. The mission was followed with great interest in the world's press. As in 1950, British and U.S. Friends sent observers to the United Nations assembly.

Among Friends all over the world much preparatory work was done for the Friends World conference, planned for the society's tercentenary year (1952) at Oxford. The Christian basis of the Quaker testimony against war was restated in a document presented to the secretary of the World Council of Churches. Many meetings advocating an early peace in Korea and protesting against rearmament were held by British Friends. During the Festival of Britain, Friends house, London, the headquarters of the Society of Friends in Great Britain, was thrown open to visitors and the manuscript of the journal of George Fox, founder of the society, was lent to the Festival of Britain Book exhibition.

The Friends allotments scheme, which helped many unemployed and others in Great Britain to obtain seeds, fertilizers and tools at low prices, came formally to an end in 1951, after 25 years, and the residue of its work was handed over to the National Allotments and Gardens society.

(B. CA.)

United States. In 1951 there were almost 180,000 Friends, of whom considerably more than half were in the United States (117,000 in the U.S., Canada and Alaska). According to the American Friends Fellowship council report of 1951, 100 new meetings had been established in the U.S. in the previous 14 years. During 1951 there were increasing evidences of a feeling of unity among all Friends, shown particularly by the enthusiastic preparation for a world conference of Friends to be held in Oxford in 1952.

In May there was published an official report of a mission of four U.S. Quakers to Yugoslavia, which had taken place in Sept. and Oct. 1950. Also early in May, the American Friends Service committee published a 64-page pamphlet, *Steps to Peace; A Quaker View of U.S. Foreign Policy*, prepared by a working committee of 15. There were 95,000 copies printed and distributed. The pamphlet offered a critical analysis of U.S. foreign policy and recommended methods other than armaments and force to resolve the east-west conflict.

During the year the Ford foundation gave the American Friends Service committee two substantial grants for use in its world-wide programme of education and reconciliation. The Technical Co-operation administration of the U.S. Department of State contributed \$150,000 to help finance a "pilot project" in social and technical assistance in the state of Orissa, India.

(L. W. R.)

FRUIT. During 1951 prices of fruit failed to keep in step with prices of other foods and raw materials and fruit growers as a body were less favourably situated than in 1950. The total world production of fruit was slightly less than in 1950, but the reduction was largely due to cyclical changes in the yield of cider fruit. Final expectations for deciduous fruits were: all apples, 575 million bu., table apples 405 million bu., all pears 156 million bu., table pears 131 million

bu. The global citrus crop was 5%-10% more than that for 1950 and 25% above the prewar figure. Banana crops made some recovery and world exports were on a 90% level as compared with prewar. Stone fruits, too, were produced in 8% greater quantity than in 1950, aggregate production being estimated at 7,170 short tons. The global fruit crop in 1951 was thus about one-third higher than the prewar average.

Export outlets for the main centres of production remained almost closed, and pressure upon internal markets was severe. Increased attention was given to processing, but adjustment in the traditionally exporting countries was slow. The long-term downward trend in the deciduous fruit acreage in the United States had been offset by higher yield per tree and per ac., and even in Canada, at a time when the seaboard provinces were finding exceptional difficulty in disposing of their apple crops and the whole structure for co-operation in marketing was in jeopardy, planting-out continued in districts near the main consuming centres.

Great Britain. The orchard area for England and Wales as returned at June 4, 1951, was 276,500 ac., 3,000 ac. higher than in 1950. As the acreage in Kent alone increased by 3,000 ac., it was probable that the relatively low national increase was due to more extensive grubbing-out of old trees in other areas. Fruit crops were generally abundant. Official Ministry of Agriculture estimates of table fruit production as at Aug. 1 were (in imperial tons): apples 560,000 (dessert 180,000, culinary 380,000), pears 27,000, plums 117,000, cherries 14,000. Weights of all crops except cherries exceeded those of 1950. The total available crop of table apples was expected to equal the 1947 record, though a less active market subsequently led to a commercial crop probably lower than in 1947. Dessert apples, however, were harvested in unprecedented quantities. The estimated production of 10 million bu. of dessert sorts was equal to 80% of average 1935-39 dessert imports. This sustained production was quite a new feature in British fruit growing; there had been no crop failure since 1941. Plums were the most disappointing crop financially. As a result of the very late season, marketings of the fresh fruit were unusually concentrated, and neither sugar nor tinsplate was available in adequate quantities for the supplies of fruit for processing; on balance, processors gave preference to soft fruit rather than to plums.

An apple and pear marketing scheme, sponsored by the National Farmers union and prepared in accordance with the Agricultural Marketing acts of 1931 and 1933, was submitted to the minister of agriculture. Growers of dessert fruit were by no means unanimous in support of the scheme. Investment in storage and in packing facilities progressed and both growers and market men shared in the movement. By the end of the season storage capacity was some 15% of a normal commercial crop.

Imports of apples in the early part of the year were the highest since 1945, Denmark and Argentina being notable suppliers.

United States. Production of most orchard fruits was higher in 1951 than in the previous year, the chief exception being apples, which were 4 million bu. down on the year, but still 3% above 1947-51 average. The effect of higher taxation and higher earnings on consumer income was watched with some trepidation, for not only were there large new crops to be cleared, but also an abnormal carryover of both fresh and processed fruit at the beginning of the year. Stocks of apples were 26% more than usual, grapefruit and pear holdings were up, while frozen fruits and juices were held over in 49% above normal quantities. Seasonal prices for apples were not so favourable after January, although 446,000 bu. were bought under the surplus removal

programme, and more than 1 million bu. had been either earmarked or handled for export programme outlets. Exports to the United Kingdom were resumed on a small scale (500,000 bu.). More than 2 million bu. were reported to be still in store on May 31, and on June 6 the Department of Agriculture instituted export programme aid for dried apples at the rate of 10 cents a lb. dry weight.

Citrus fruit production was estimated to be higher than in 1950 by 8% for oranges and tangerines, and 25% for grapefruit. Californian production diminished, but gains in Florida and Texas more than offset the loss. Some 60% of the Florida crop went for processing into canned juice. Programme-aided exports of canned juice, at 723,000 gal. were four times greater than in 1950. As from Nov. 15, 1950, export aid had been available to grapefruit and grapefruit products. Packs of frozen apple concentrate were reported from both eastern and western producing areas. Official estimates of production of the principal crops were: oranges 111,550,000 boxes (California 44,800,000, Florida 62,300,000), tangerines 4,600,000 boxes, grapefruit 44,370,000 boxes, lemons 13,000,000 boxes; apples 119,892,000 bu., pears 31,397,000 bu., peaches 67,772,000 bu., grapes 3,244,600 tons, cherries 232,210 tons, plums 102,000 tons.

(R. R. W. F.)

FURNITURE INDUSTRY. Heavy buying of furniture by the public, which had begun in the previous autumn, continued during the first half of 1951. Fear of shortages resulting from the rearmament programme and a belief that prices would soon rise persuaded householders to buy furniture probably in excess of their current needs. During the second quarter of the year manufacturers' sales of utility furniture were more than £30 million; because of increasing financial stringency, however, a very high proportion of this was bought by the public on hire purchase terms, with the result that the large credit firms now had outstanding debts of many millions of pounds.

Suddenly the picture changed. Following, but not necessarily because of, an interim increase in the permitted prices of utility furniture in the middle of the year, public demand slowed down and in some areas came almost to a standstill. The probable reasons for this were the increased cost of living, over-buying in the earlier months and a general feeling of uncertainty. The result was the operation of short time in nearly all furniture factories, with some working as few as three days a week. Following the election in October, however, a slight improvement began to be felt, and the target of 300,000 houses a year which the new government had set itself in the building programme gave hope of a gradual return to normal trading conditions.

The industry's embarrassment, caused by alternating periods of strong and weak buying, was increased by the rapid rise in production costs. Raw material costs leaped alarmingly throughout the year, wages were increased by 2*l.* an hour through an increase in the cost-of-living bonus, and the new carriage charges for transporting furniture from factory to shop issued by Road Haulage executive (to which the handling of furniture by road had been given as a monopoly) showed increases amounting in some instances to more than 100%. For these reasons manufacturers found that it was becoming impossible to produce the higher qualities of utility furniture within the maximum prices permitted by the Board of Trade. Urgent representations were made for higher ceiling prices for many models and, following the completion of the Board of Trade's investigation into furniture production costs, these were granted in December.

One of the first productivity teams to go to the United States was sent by the British furniture industry. The team's

preliminary report showed that much information had been gathered, and it was hoped that their final report would eventually provide manufacturers with many improved processes that would decrease production costs, offset to some extent the increases in raw material and labour costs, as well as in transport charges, and result in lower retail prices. (L. L.)

United States. The 4,000 factories in the United States making wooden and upholstered furniture during 1951 recorded a total dollar output for the year of about \$1,525 million, as compared with the 1950 production of \$1,500 million, the highest volume ever before attained. The 1951 unit volume, however, was 9% smaller than the 1950 output. The high production during 1951 was the result of scarce buying following the outbreak of the Korean war. This created a buying lull during the spring and early summer season; autumn and holiday buying during the balance of the year, however, brought the total dollar volume above the previous year's total.

Furniture prices rose 12% at the manufacturers' level in 1951. Some factories received small price increases from the Office of Price Administration upon proof of higher production costs, but the majority asked for no relief, in order to remain competitive.

French Provincial furniture was the favourite style in the U.S. in 1951, especially in the costlier range. Although modern furniture still accounted for the largest number of units produced and sold, French Provincial was rapidly approaching it and was second in demand. (See also INTERIOR DECORATION.) (J. A. G.)

FURS. The British fur trade's contribution to the Festival of Britain 1951 was an exhibition staged at Beaver hall, London—the headquarters of the Hudson's Bay company—at which the whole story of the British fur industry was portrayed.

Some of the special features were: a collection of about 250 different varieties of skins from all over the world; a section showing the various stages in the dressing and dyeing of skins; the manufacture of fur garments by skilled operatives; and a fine display of model garments by some of the leading firms in the industry. Queen Mary and other distinguished visitors saw the exhibition, and there was an attendance of about 50,000, including many visitors from overseas.

The International Fur Trade federation met in London on several occasions during the year, and many important problems of interest to the world's fur trade were discussed. The promotion of a world fur propaganda and publicity campaign met with the approval of all the delegates, but measures to raise the necessary funds were not decided on. Sir Patrick Ashley-Cooper (Great Britain) was re-elected president, R. H. Papernow (U.S.) vice president; Leopold Swiners (France), chairman; Gordon Blyth (Great Britain), vice chairman; and M. Mousson-Mallien (Brussels), hon. treasurer.

British fur breeders held their first postwar pelt show in Jan. 1951. A large number of mink and fox pelts were exhibited, and it was noted that the mink pelts, in particular, could be favourably compared with any bred elsewhere. This branch of the industry was making rapid progress. The number of breeders was increasing and it seemed likely that within a few years the volume of pelts produced would make an important contribution to the export trade.

The British home trade did good business during the first six months of the year, but the second half of the year was most disappointing. This could partly be attributed to the exceptionally mild and rainy autumn.

On the other hand, the year showed record figures for

Two British dealers examining furs at the international fur auctions held in Leningrad in Aug. 1951.

fur imports and exports. In the ten months ending Oct. 31, 1951, imports amounted to £21,882,311, as compared with £13,288,662 in 1950. Exports were £19,416,453 (1951), as compared with £13,367,639 (1950). (S. L. L.)

United States. Retail sales of furs in the United States continued to be satisfactory through the first quarter of 1951, but thereafter steadily declined, and from June onward a period of confusion and difficulty was experienced in the trade. Production of ranch and mutation mink continued to increase. The total world crop was estimated at 3.5 million to 4 million skins, as compared with about 3 million to 3.5 million in 1950. The U.S. produced about 2 million to 2.5 million skins, Canada about 800,000 and the Scandinavian countries about 500,000. The new mutation "Sapphire," a clear, light blue, introduced in 1950, fetched up to \$350 a skin, a record for any mink.

Early in 1951, when business was unusually good, raw fur prices shot upward to levels 25% to 30% above those prevailing in late 1950. When manufacturers made up their new lines in May and June, they found prices higher than the consumer would pay. After months of gradual downward price adjustments, mink again began to move, especially in the mutation family of pastels, silver blues, Aleutians and others. Persian lamb also encountered price difficulty, but managed to continue among the better sellers, along with sheared raccoon, Alsaka seal, mouton, muskrat, beaver, squirrel and marmot.

A feature of the year was the further development of blonde dye colour on many furs. Introduced on otter a few years earlier it was expanded to nutria, beaver, sheared raccoon and Australian opossum, and was well received in many sections of the country. Styles followed the modified pyramid, with natural shoulders and mostly small collars and turn-back, cocktail cuffs. Small fur pieces—capas, jackets, capelets, and especially stoles—proved more popular than ever, one reason being the high prices of full-length coats during the first half of the year.

According to government tax collections, total sales for the year would be from \$250 million to \$260 million, or about the same as 1950, which was also a subnormal year. Four or five years earlier the total volume had been between \$400 million and \$450 million. (E. SN.)

FYFE, SIR DAVID MAXWELL, British politician (b. Edinburgh, May 29, 1900), was educated at George Watson's college, Edinburgh, and Balliol college, Oxford, and was called to the bar by Gray's Inn in 1922. He practised on the northern circuit and became a K.C. at 33, the youngest barrister to do so since 1668. He was made a bencher of Gray's Inn and a member of the general council of the bar in 1936. He was returned to parliament unopposed in a by-election in 1935 in the West Derby division of Liverpool, which he continued to represent. Fyfe was solicitor general in Winston Churchill's wartime coalition from 1942 to 1945 and attorney general in the caretaker government in 1945. He was recorder of Oldham from 1936 to 1942. At the Nuremberg war crimes trials he was deputy chief British prosecutor. In Winston Churchill's government of 1951 he was appointed secretary of state for home affairs and given special responsibility for Welsh affairs.

GABON: *see* FRENCH EQUATORIAL AFRICA.

GAMBIA. British colony and protectorate on the west coast of Africa surrounded by the French territory of Senegal. Area: 4,033 sq.mi., incl. 69 sq.mi. for the colony. Pop.: (1931 census) 199,520; (1949 est.) 276,000, almost entirely African with Arab admixture. Capital, Bathurst (1944 est. 21,152). Language: many tribal dialects, Hausa. Religion: predominantly Moslem, some pagan, c. 5,000 Christians. Administration: governor; executive council, 1 *ex-officio* member, 5 official and 4 unofficial; legislative council, 3 *ex-officio* members, 4 nominated official, 5 nominated unofficial (4 from the protectorate and 1 for commercial interests) and 3 elected. Governor, Percy Wyn Harris.

History. The new constitution came into operation in 1951, and elections in Bathurst for three members of the legislative council took place on Oct. 25. It was also announced that the number of unofficial members of the executive council would be increased to four, to be selected from the eight unofficial members of the legislative council, and that two of them would be members of government without portfolio and receive remuneration.

Early in the year, it was announced that modifications would have to be made in the scheme undertaken by the Colonial Development corporation in 1948 for the production near Bathurst of dressed poultry and eggs for the British market, as it had proved impossible to grow feeding stuffs locally. Later, after a serious outbreak of poultry disease, it was decided to abandon the scheme altogether. The total expenditure on the scheme up to Dec. 31, 1950, was £832,645. An experimental farm was established on part of the land cleared for this scheme to test the possibility of growing cotton and tobacco.

Education. School enrolment (1948) 3,770.

Finance and Trade. Currency: West African pound (£WA=£1 sterling). Budget (1950): revenue £999,216; expenditure £1,062,311. Foreign trade (1950): imports £2,752,000; exports £1,743,000. Principal export: groundnuts (65,000 tons). (K. E. R.)

GAMBLING: *see* BETTING AND GAMBLING.

GAS. The first report and accounts of the Gas council since nationalization were published during 1951 and covered the period July 1948 to March 1950. They gave a comprehensive picture of the industry under public ownership, but much of the information was of necessity out of date. It was intended to reduce the time lag in 1951 by publishing the accounts for the period April 1950 to March 1951 on Dec. 10.

The production of gas during the year showed a steady increase of over 5%; both coal gas and water gas contributed

to the increase. There was also an increase of about 5% in the amount of gas bought from coke ovens. The production of coke also increased, but stocks during the year fell considerably. In Jan. 1950, for example, the total stocks were 2,317,000 tons, and in Jan. 1951 1,245,000 tons; in June 1950 they were 2,211,000 tons, and in June 1951 1,263,000 tons. This meant that coke had to be rationed again.

The year was again one of large capital extensions, and there was news of new plant going up in many parts of the country. In spite of this the demand for gas still exceeded the supply, and the rearmament programme made severe calls on the industry, particularly in the midlands.

On the distribution side, plans for gas grids were announced by various gas boards, the most ambitious being those of the North-Western Gas board and the Wales Gas board. Some of these would take several years to complete, but their progress would be marked by improved efficiency as the smaller and less efficient gas works closed down.

The high production of gas cookers achieved in 1950 was almost maintained in 1951, in spite of the growing scarcity of materials. The production of gas wash boilers, however, increased from about 400,000 to about 450,000, and that for gas water heaters also increased slightly. Gas meter production was about the same. Much preliminary work was done during the year on gas research, but the former Gas Research board, which included representatives of the gas undertakings, the gas plant manufacturers and the Department of Scientific and Industrial Research, was being wound up, and the Gas council was undertaking the organization of research, in accordance with the nationalization act. A new research council was set up and included a number of distinguished scientists, and in addition to the existing London Research centre a new centre was proposed for the midlands, at which the problems of complete gasifi-

cation would be carefully studied. Interesting experiments in the midlands in underground gasification of coal, although conducted by the Ministry of Fuel and the Coal board, were being watched with great interest by the gas industry.

It was a year practically free from strikes and labour troubles, but the rising cost of living resulted in a number of increases in wages and salaries, which combined with increasing costs of coal, transport, oil, etc., to increase the prices of gas throughout the country. Nevertheless, the price of gas was still less than twice its prewar price in most areas. In one area, the North Thames Gas board's, uniform prices of gas were introduced throughout the area—probably the first instance of its kind in the world. Requests were received from consumers in other areas for a similar scheme, but it seemed possible that they were not sufficiently concentrated for this to be easily achieved. Most area boards succeeded in arriving at uniform prices for gas appliances, and there were requests for uniform prices throughout the country, but these were not found to be possible. Concerning staff, there was considerable progress towards standard terms and conditions, and machinery for salary negotiations was beginning to take shape.

In view of the general shortage of gas, coke and appliances, gas publicity was on a restricted scale. Advertising, having been completely stopped in the winter months at the request of the minister of fuel, was resumed on the smaller scale of advising consumers about the care and maintenance of their equipment. The production of educational films and film strips, however, continued as before, and every quarter the number of showings to schools, associations, clubs and other bodies increased.

The industry had always taken a large part in exhibitions, and this continued during 1951, the Gas council being responsible for displays at national exhibitions, such as the

Coke being discharged from the coke-oven at Nantgarw, Glamorganshire, which was opened on Sept. 20, 1951. The basic daily output of the plant included 1,100 tons of coke and 16,500,000 cu.ft. of gas.

Ideal Home and the British Industries fair, and the area boards for local exhibitions, civic weeks and similar efforts. In March, a new exhibition hall was opened at Watson house, Fulham, containing a comprehensive series of displays of the production, distribution and utilization of gas in industry, commerce and the home. This exhibition hall was to be used for visits of local authorities, commercial and industrial bodies, and selected parties from the general public. During the year Watson house research, development and training departments, which were formally owned by the Gas Light and Coke company and later the North Thames Gas board, became a national centre subscribed to by all the area gas boards.

The Gas Consultative councils were very active during the year, and numbers of problems concerning price increases, charges for equipment and meters were discussed with the area boards and solved to the satisfaction of both sides.

In Europe, there was a similar record of steady progress in 1951. In France, in the fourth year of nationalization of the gas industry, there were increases in gas plant and coke ovens, and in the distribution network. In the Netherlands, too, there was news of extension of existing works and erection of new centres of production. In the Netherlands, Belgium and Germany there was an increasing tendency to set up distribution companies which purchased gas from large manufacturing centres, distributed it by high pressure network and then resold it to local undertakings. (L. HDN.)

GASCOIGNE, SIR ALVARY DOUGLAS FREDERICK, British diplomat (b. Aug. 6, 1893), was educated at Eton college and served in World War I, when he was mentioned in dispatches. He joined the Foreign Office in 1919 and after a number of appointments abroad was consul general in Tangier (1939-44), British political representative in Hungary (1945-46) and United Kingdom political representative in Japan (1946-51). He went to Moscow in Oct. 1951 to succeed Sir David Kelly as ambassador. He was created K.C.M.G. in Jan. 1948.

GAS TURBINES: see JET PROPULSION AND GAS TURBINES.

GEMS. An otherwise uneventful year was marked by the discovery of a further gemstone. Yet, since only two cut specimens had been known to exist, this could be regarded as of academic interest only. The discovery was made while a Dublin collector was examining a parcel of spinels, when slight birefringence was noticed. Its hardness was found to be the same as spinel, and the refractive index and specific gravity were also very close to those of that species. As its general appearance was similar to that of spinel and the double refraction was so small, it was suggested that other specimens might have been identified incorrectly as spinel.

Another noteworthy event was the publication of the fifth edition of *Gem Testing* by B. W. Anderson (London, 1951), in which were recorded all the recent developments in the production of synthetic stones, the latest results of Anderson's research work in spectrology as applied to gemstones, and a full description of the "distant vision" method of using the refractometer. (See also DIAMONDS; MINERALOGY.) (F. E. LK.)

See Francis J. Sprisken, *The Art of the Lepidary* (Milwaukee, Wisconsin, 1951).

GENETICS. The 16th annual symposium on quantitative biology at Cold Spring Harbor, Long Island, New York, was in 1951, as in 1941, devoted to the subject "Genes and Mutations." The most remarkable difference between the two meetings was the displacement of the classical genetical objects *Drosophila* and maize by micro-organisms,

such as fungi, protozoa, bacteria, viruses and the *pneumococcus* transforming principle. This change resulted in drastic revisions of current conceptions of the gene, which was seen to be neither so uninfluenced by the surrounding medium, nor so individually distinct from its neighbours, as was formerly thought. Nevertheless, the fundamental notion of the gene as a self-reproducing unit, retaining its specificity unchanged through innumerable replications, seemed as well established as ever. No western geneticist would concede that induced genic changes of an adaptive nature occurred. Moreover, though the role of the cytoplasm in the expression of hereditary traits became increasingly recognized, especially as a result of studies with the ciliate protozoon *Paramecium*, the chromosomal gene was still regarded as the essential and most fundamental unit of heredity.

Apart from the reports on micro-organisms, great interest was shown in the work of Barbara McClintock with maize. It was found that small pieces of chromosome could frequently be transposed from one region of the chromosomes to another (such transposition being itself under genic control) and, as a result, often caused striking alterations in the properties of genes near to the disturbed regions.

Irregularities in Chromosome Number. It had long been assumed that every cell of an organism, with few exceptions, contained the same number of chromosomes. Since the addition or subtraction of a chromosome in *Drosophila* could lead to the death of the affected individual, an exact and even distribution of chromosomes to every cell seemed essential for the satisfactory functioning of the genic system. Recent observations of somatic cells (especially of differentiated cells) in higher animals and plants showed the falsity of this assumption. Thus, Eeva Therman and Sakari Timonen found, with human material, that irregular chromosome numbers occurred in both adult (uterine epithelium) and embryo (skin, liver, connective tissue, intestine, etc.) tissues. Outside the germ line the diploid number of 48 was rarely found, and the numbers ranged from 20 to 50.

Therman also examined differentiated cells of the plant *Allium cepa*. By treating the roots with indole-3-acetic acid, cells which had ceased dividing were induced to divide once more, and then revealed the presence of a large number of chromosomes, often many times the normal diploid number. Soviet workers, studying various somatic tissues—the epithelial cells of the skin and gut in the chick, pig and sheep—also found very irregular chromosome numbers, and concluded that such results were inconsistent with the postulates of classical genetics. Therman and Timonen, however, saw no such inconsistency. They assumed that each of the 48 chromosomes present in the human fertilized egg divided the same number of times, but that in differentiated somatic tissues, the daughter chromosomes might be unevenly distributed among the individual cells. Because of the intimate physiological interaction between neighbouring cells in higher animals, a lack of a chromosome in one cell could easily be compensated for by an extra chromosome in a neighbouring cell. The tissue as a whole would have a satisfactory balance of genes. The chromosome theory of heredity would be seriously challenged only if such irregular numbers were to be found in the germ cells, and that was never observed.

Genetics of Influenza Virus. F. M. Burnet, working with human influenza virus, found that he could get a recombination of two or more hereditary traits previously present only in separate strains. He did this by injecting into mice two strains of virus simultaneously, one of which produced encephalitis, while the other formed an extremely heat-resistant haemagglutinin. He was then able to extract from the infected mice a new strain of virus exhibiting both traits. Such a strain had never been encountered previously, and

was assumed to arise through some kind of reassortment of gene-like particles in the virus while the latter was developing in the mice cells. This kind of recombination process had been previously found also with bacteriophages, and could be of great importance in the sudden production of new, highly virulent strains of virus in nature.

Reproduction of Bacteriophage. Experiments had been attempted to distinguish between parental and assimilated atoms in the growth of bacteriophage. Thus F. Putman and L. Kozloff grew bacteriophage in bacteria "labelled" with radioactive phosphorus P^{32} . The labelled bacteriophage thus obtained was then grown in unlabelled bacteria, and a second generation of bacteriophage obtained. It was found that this second-generation bacteriophage contained only 30% of the radioactivity of the parental bacteriophage, and Putman and Kozloff considered that this might indicate that the bacteriophage consisted of two parts, a genetic and a non-genetic one. Only the radioactive phosphorus in the genetic part would be transmitted to the next generation. O. Maaløe and J. D. Watson then continued the experiment a further generation and found that once again only 30% of radioactive phosphorus was recovered in the third generation. Consequently, the distinction into genetic and non-genetic parts was seen to be unreal, and the problem of distinguishing parental from assimilated atoms remained intractable.

(G. H. BE.)

GEOGRAPHY. The annual meeting of the Institute of British Geographers was held in Oxford in Jan. 1951, under the presidency of Professor A. G. Ogilvie, of the University of Edinburgh, the members residing for the week in Jesus and Lincoln colleges. The papers covered a wide and representative range of subjects of research in British universities but the item of most general interest was perhaps the evening discourse by A. F. Martin on metaphysical problems which confront the geographer; he considered the implications of determinism and its validity as a working hypothesis.

The British Association for the Advancement of Science met in Edinburgh in August under the presidency of the Duke of Edinburgh, and its geography section celebrated its centenary. The presidential address to the section, by O. J. R. Howarth, appropriately reviewed the advance in the subject for which the section had ever been a focus and in which Howarth had played an active part in the great days of Sir Halford Mackinder and A. J. Herbertson. Two of Mackinder's most famous papers were reprinted in 1951 by the Royal Geographical Society *The Scope and Method of Geography* (first published in 1887) and *The Geographical Pivot of History* (first published in 1904). As might be expected from the venue of the meeting, it dwelt largely on the geography of Scotland but one whole day was devoted to papers on the survey of the world's under-developed areas, towards which the World Land Use survey has a special contribution to make; pilot survey sheets from many lands were on exhibition. The first fruits of the British Association Geographical Glossary committee were published this year in the *Geographical Journal* (147, 445-46) under the title "Some Definitions in the Vocabulary of Geography."

The Commonwealth Survey Officers' conference, last held in 1947, took place in July at the Royal Institution of

Chartered Surveyors in London. The techniques of air survey and the recent considerable progress in the mapping of British territories in Africa were among the principal subjects discussed. The diverse triangulation systems of Europe had recently been recomputed on a uniform basis and the conference approved a system of transverse Mercator projections, each belt to cover six degrees of longitude, which would provide a basis for survey computations of world-wide application. The observation of solar eclipses with photo-electric instruments was proposed as a means of effecting measurements between the continents, for if the rate of advance of the moon's shadow through space is known with sufficient accuracy the interval between the eclipses observed at two stations will determine their distance apart.

The International Union of Geodesy and Geophysics met in Brussels in August. Its constituent associations cover a wide range of subjects—geodesy, seismology, meteorology, magnetism, oceanography, vulcanology and hydrology—these are special studies in themselves and the scientific backbone of physical geography. The most notable papers were perhaps on the recent advances in oceanography and climatology.

An international congress on Columbus studies was held in Genoa in March as part of the celebrations extending over a year by which that city marked the 500th anniversary of the birth of Columbus; maps, pictures and relics were on exhibition at the Palazzo San Giorgio and the foundation of the Civico Istituto Columbiano in Genoa was announced.

The Royal Geographical Society of Egypt celebrated its diamond jubilee and ceremonies were held simultaneously to commemorate the silver jubilee of the Fuad I university in Cairo and the inauguration of the Fuad I Desert institute.

The gold medals of the Royal Geographical Society of London were, with the king's approval, awarded to V. E. Fuchs, leader of the Falkland Islands Dependencies survey in the Antarctic during the years 1948-50 and to Donald Thomson of Melbourne university for his geographical and anthropological work on the little-known northern coasts of Australia. The society's Victoria medal was awarded to C. A. Cotton of Victoria University college, New Zealand, for his contributions to the science of geomorphology.

The World Land Use survey which had been mooted at the International Geographical congress in Lisbon in 1949 came into being with the establishment in January of the headquarters of the Old World division at the house of the Royal Geographical Society in London. A number of pilot sheets of the survey were immediately taken in hand, both to test methods of compilation from existing materials and also the suitability of the proposed scheme of classification, and to demonstrate the diversity of land use in different parts of the world. These were exhibited at the British association meeting in Edinburgh. With the increasing importance of international plans for the development of under-developed areas this was a most promising field of geographical research, and one in which remarkably little had been done on a scale which would admit a world-wide assessment of the present use of land.

The picture of land use is one that is changing rapidly; but few projects for development can be as ambitious as that which was outlined in the newspapers of the U.S.S.R. for the diversion of the major rivers of Siberia. Yet it had points of considerable interest; the Ob, Yenisei and Lena carry an abundance of water to the frozen and uninhabited wastes of the north. The watershed between the Ob and the Aral sea is relatively low and, to the south, lands now desert lie in a latitude more promising for development. A dam less than 300 ft. high would effect the diversion, but the canal to carry this immense volume of water would be 900 km. long. It was claimed that the consequences of the diversion

would be unparalleled; apart from a vast area under irrigation, the Aral sea would become a fresh water lake and the coastal waters of the Arctic ocean more salt than they are now. Far-reaching plans were already understood to be in hand for the irrigation of a part of these southern deserts from the Amu Darya, which was being diverted into its old channel to the Gulf of Kara Bogaz on the Caspian sea.

The year was notable for the publication of a number of books which attempted to set out the scope of geography as a science. S. W. Wooldridge's and W. G. East's *The Spirit and Purpose of Geography* (London) did not perhaps entirely fulfil the promise of its title but made it clear enough that the physical and human branches of the subject are not separate studies, but parts of a whole. Griffiths Taylor's *Geography in the Twentieth Century* (London) was a collection of essays, some dealing with special topics, but many of them displaying the wider views of American and British geographers of the highest standing. L. D. Stamp's and S. W. Wooldridge's *London Essays in Geography* was a somewhat similar collection, the essays being contributed by the pupils and colleagues of the late Professor L. Rodwell Jones of the London School of Economics; the emphasis was on economic geography, the dominant interest of Rodwell Jones himself. Two interesting papers on the general subject of climatic change were on "The Range of Variation of the British Climate" by Gordon Manley (*Geographical Journal*, 117, 43-68, London), which set out to reconstruct the weather conditions that must have obtained after the recession of the glaciers of the Ice Age, and "The Climate of Egypt: an Historical Outline" by G. W. Murray (*Geog. J.*, 117, 419-31), which interpreted the modern desert landscapes in terms of the corresponding changes in rainfall in that country. (See also ANTARCTICA; EXPLORATION AND DISCOVERY.)

(F. GE.)

GEOLOGY. Physical Geology. A statistical analysis was applied to the problem of recognition of ancient erosion surfaces by O. T. Jones in his presidential address to the Geological Society of London. The need for objective methods to check subjective impressions had long been clear but rarely attempted.

In Nordaustlandet, Spitsbergen, an Oxford party, in the summer of 1951, in the course of thermal drilling through ice, discovered minimum temperatures of approximately -9°C at a depth of about 50 ft. Glaciers, in temperate latitudes, approximate to 0°C .

In the Arctic basin large floating islands of ice up to 1,000 ft. thick and 25 mi. in diameter, were observed by the United States Air Force.

Professor Blackett developed an instrument for rapid determination of direction of palaeomagnetism in sediments. Basalts in Iceland showed several cases of reversed polarization, which consistently correlated with stratigraphically distinguishable phases of eruption.

Mineralogy. Two systematic indexes appeared for the identification of minerals and crystals each after many years of preparation: *An Index of Mineral Species and Varieties arranged Chemically* by Max H. Hey (British Museum, Natural History, London, 1950) and *The Barker Index of Crystals* by M. W. Porter and R. C. Spiller (Cambridge, 1951).

The study of feldspars, the largest group of rock-forming minerals, had achieved the status almost of a separate science. A special number of the *Journal of Geology* (vol. 58, no. 5, Chicago, 1950) was devoted to some recent advances in this field.

Petrology and Tectonics. Sill intrusions showing a number of remarkable contact structures were described by O. Tweto in "Form and Structure of Sills near Pando, Colorado" (*Bull. Geol. Soc. Amer.*, vol. 62, pp. 507-532, New York,

1951). The margins showed faulting, folding, and *b*-lineation of crystals, in contrast to *a*-lineation found in the body of the sill. It appeared that magmas of greater viscosity formed regular widespread sills and, conversely, more fluid magmas produced irregular swellings, possibly due to contemporaneous arching.

Marine Geology, by Ph. W. Kuenen (New York, 1951), covered a wide range of sedimentary problems in the field of sedimentary petrogenesis. *Stratigraphy and Sedimentation*, by Krumbein and Sloss (San Francisco, 1951), epitomized this outlook, already suggested 40 years earlier by Grabau. The palaeogeographical and tectonic approach to sedimentary environments marked an emphasis developed during the intervening years.

Practical applications of sedimentary petrology were emphasized in two important publications: *Technische Gesteinskunde*, by von Moss and F. de Quervain (Basle, 1948), and *Applied Sedimentation*, edited by P. D. Trask (New York, 1950), with 35 contributions by different authors on the interrelation between fundamental problems of geology and engineering practice.

After years of steady expansion of the oil industry, 1951 was marked by the sudden appearance of several general works including: E. N. Tirtsoo, *Petroleum Geology* (London, 1951) and K. K. Landes, *Petroleum Geology* (New York, 1951). A valuable symposium in a similar but wider field was Le Roy's *Subsurface Geologic Methods* (Colorado School of Mines, 1950).

Palaeoclimatology. It was shown (Epstein *et al.*, "Carbonate-water Isotopic Temperature Scale," *Bull. Geol. Soc. Amer.*, vol. 62, pp. 417-426, New York, 1951) that the proportion of the O^{18} isotope in calcium carbonate, as formed in marine shells, varied with temperature. When the relative abundance of O^{18} in sea water was known the temperature of formation could be deduced to an accuracy of $\pm 1^{\circ}\text{C}$.

This was applied to the measurement of palaeotemperatures. Preliminary results were given for the Upper Cretaceous of England, Denmark and the southeast United States, which indicated a uniform temperature of $15^{\circ}\text{--}17^{\circ}\text{C}$ (H. C. Urey *et al.*, "Measurement of Palaeotemperatures and Temperatures of the Upper Cretaceous of England, Denmark and the S.E. United States," *Bull. Geol. Soc. Amer.*, vol. 62, pp. 399-416, New York, 1951).

A thorough review of Molluscan faunas reproduced the orthodox conclusion that, in the Pacific during the Palaeocene and Eocene, the 20°C marine isotherm was north of 49°N . Thereafter, successive cooling brought temperatures down to their present level in mid-Pliocene. The present arrangement of coastlines was thought to be adequate to explain these distributions ("Cenozoic Marine Climates of the Pacific Coast," by J. W. Durham, *Bull. Geol. Soc. Amer.*, vol. 51, pp. 1243-64, New York, 1950).

Ernst Mayr argued against parts of Wegener's and DuToit's hypotheses ("Bearing of some Biological Data on Geology," *Bull. Geol. Soc. Amer.*, vol. 62, pp. 537-546, New York, 1951). According to his analysis, the distribution of birds in the southern hemisphere favoured the present distribution of the continents since late Mesozoic time.

The Oceans. Rapidly increasing facilities for echo-sounding enabled Tolstoy to outline the "Submarine Topography of the North Atlantic" (*Bull. Geol. Soc. Amer.*, vol. 62, pp. 441-450, New York, 1950). In places, the shape of the mid-Atlantic ridge was shown to suggest faulting and folding. (See also OCEANOGRAPHY.)

Gutenberg's revised seismic analysis of "Crustal Layers of the Continents and Oceans" (*Bull. Geol. Soc. Amer.*, vol. 62, pp. 427-440, New York, 1950) continued to contrast the Pacific (no distinguishable sial) with the Atlantic (possibly with a little sial). (See SEISMOLOGY.)

W. H. Bucher argued ("Megatectonics and Geophysics," *Amer. Geophys. Union Trans.*, vol. 31, p. 495) that, from an initial basaltic layer, sial grew in orogenic zones by addition of potash brought up from below in the waters forming the hydrosphere.

The idea of slow accumulation of the oceans fitted determinations of the atmospheric content of A.⁴⁰. Assuming this to have derived from K.⁴⁰, J. L. Kulp argued ("Origin of the Hydrosphere," *Bull. Geol. Soc. Amer.*, vol. 62, pp. 326-329, N.Y., 1951) that the sial, hydrosphere and atmosphere might turn out to be a gradual accretion from below.

Regional Geology. Britain. The D'Arcy Exploration company reported on the progress made between 1945 and 1949 in the search for carboniferous rocks with suitable anticlinal structures in southern England. Over a large area systematic gravity and magnetic surveys were carried out. This was summarized on several maps (see "The Gravitational and Magnetic Exploration of Parts of the Mesozoic Covered Areas of South Central England," *Quart. Journ. Geol. Soc.*, vol. 106, pp. 141-170, London, 1951).

Research on the concealed coalfields, carried out by the Geological Survey in collaboration with the National Coal board, gave specially valuable results: extensions of the South Derby and Leicestershire and the Bristol and Somerset and the South Lancashire coalfields were proved. A bore near Northleach, Gloucestershire, was carried to 4,500 ft. through Jurassic and Triassic rocks. The survey also took part in a search for new sources of sulphur, including the investigation of extensive reserves of anhydrite in the St. Bees area of Cumberland.

Caledonides. Holtedahl, Wollaston medallist, gave the William Smith lecture to the Geological Society of London on the tectonic history of Scandinavia. Speculations on the relations of his structures to Scotland and Spitsbergen were attempted. Attention was drawn to the suggestive contribution by J. S. Turner, "The Deeper Structure of Central and Northern England" (*Proc. Yorks. Geol. Soc.*, vol. 27, pp. 280-297, 1949). Holtedahl and his Norwegian colleagues had long worked in Spitsbergen. In 1951, three British university expeditions from Birmingham, Cambridge and London continued studies in the structure and stratigraphy of the Hecla Hoek rocks, supposed by many to represent a northern continuation of the Caledonian orogen.

European Alps. Continuing a tradition of comprehensive alpine syntheses, E. Kraus published a further work, "Baugeschichte der Alpen" (*Akad. Verlag, Berlin*, vol. 1, 1951), which dealt with the succession of strata and tectonic events to the end of the Cretaceous.

F. X. Schaffer, (editor, *Geologie von Österreich*, 2nd ed., Vienna, 1951), continued a notable work in which leading geologists presented a thorough account of the geology of Austria.

Mediterranean Region. New ideas regarding the structure of Italy involved important concepts which, if proved, would have general influence on tectonic theory. A school of geologists regards much of Italy, as comprising, for instance, the Argille Scagliose, as allochthonous; moreover, the structures showed a fluid gravitative mode of deformation riding on erosion thrusts. E. Beneo gave a description and tectonic sketch map of Italy on this basis ("Tentativo di sintesi tettonica dell'Italia peninsulare ed insulare," *Boll. Geol. Soc. Ital.*, 68, pp. 1-15, Rome, 1949). These ideas were applied to economic possibilities in his paper "Le possibilità petrolifere della Sicilia nel quadro di una più realistica interpretazione della tettonica Italiana" (*Boll. Servizio geologico d'Italia*, vol. 72, Rome, 1951), and extended to an interpretation of north Morocco, "Sull' Identità tettonica esistente fra la Sicilia e il Rif" (*Boll. Serv. geol. d'Ital.*, vol. 72, Rome, 1951).

Preliminary results of further gravity surveys in one of H.M. submarines in the eastern Mediterranean showed negative belts of anomalies south of the main Dinaric and Taurus mountain arcs.

India. The third edition, revised by Sir Edwin Pascoe, of the *Manual of the Geology of India and Burma* (in 4 vols., vol. 1 [pre-Cambian], 1950, Calcutta), marked the end of one stage in Indian geology and provided for the future a valuable source of well-organized detail.

Africa. Furon's *Géologie de l'Afrique* (Paris, 1950) provided another comprehensive view of a Gondwana continent, in this case with emphasis on Mesozoic and Tertiary deposits. *A Mineral Map of Southern Rhodesia*, 1: 500,000, (Salisbury, 1951) summarized the distribution and total production to date of economic minerals.

North America. Perhaps the most important general publication was A. J. Eardley's *Structural Geology of N. America* (New York, 1951). This treatise, designed for students, summarized for the first time the structural characteristics of each of the major tectonic elements which make up the continent and provided a convenient summary of published material with references. The *Tectonic Map of Canada*, 1: 3,801,600, (Geological Association of Canada, 1950) was a valuable summary at a time of active exploration.

South America. Two important maps were published by the Geological Society of America in 1950. The *Geological Map of S. America*, 1: 5,000,000, was compiled by G. W. Stose and followed the style and scale of the earlier revised map of the northern continent. A *Geologic-Tectonic Map of the United States of Venezuela*, 1: 1,000,000, was compiled by W. A. Bucher and made available much of the data previously known only to oil companies. (See also MINERALOGY; OCEANOGRAPHY; PALAEOLOGY; SEISMOLOGY.)
(W. B. HD.)

GEORGE VI (ALBERT FREDERICK ARTHUR GEORGE), king of Great Britain, Ireland and the British dominions (b. York cottage, Sandringham, Norfolk, Dec. 14, 1895); for his earlier career see *Encyclopædia Britannica* and *Britannica Book of the Year 1951*. On Jan. 1, 1951, he broadcast to Australia on the opening of the jubilee year of the Commonwealth. But his proposed tour of Australia and New Zealand in 1952 had to be cancelled after his operation in September and it was announced that Princess Elizabeth, accompanied by the Duke of Edinburgh, would carry it out in his stead. He received the commonwealth prime ministers for luncheon at Buckingham palace on Jan. 4 and held a Privy Council meeting in which they took part. In February Clement Atlee, in reply to a question in the House of Commons by Winston S. Churchill, announced that, to help to meet the higher cost of running the royal households, the king would in future receive free telephone and telegraph services from the Post Office and that the cost of fuel and power would be met by the Ministry of Works, making a total relief of about £40,000 a year; the king had also indicated his desire to make certain economies which would save £20,000.

The first report in 1951 of the king's being unwell was when he had a feverish chill in March. He fulfilled a number of engagements that month and in April, and on May 3 attended the service of dedication and opened the Festival of Britain at St. Paul's cathedral. He received King Frederik and Queen Ingrid of Denmark on their state visit, May 8-11. Later in May he had influenza and early in June suffered from catarrhal inflammation of the lung and was ordered a complete rest. His speech at the state dinner at Buckingham palace for King Haakon of Norway on June 5 was read by Princess Elizabeth. On Sept. 1, he was visited at Balmoral by Dr. George Cordiner, a radiologist, and Dr. Geoffrey Marshall, an authority on respiratory diseases. He visited London on

King George VI with his grandson, Prince Charles. This photograph—the first after the king's operation on Sept. 23—was taken on Prince Charles's third birthday, Nov. 14.

Sept. 8-9 to permit further clinical investigations to be carried out and on Sept. 15 returned to London from Balmoral; three days later a bulletin stated that certain structural changes had developed in the lung and that he had been advised to remain in London for further treatment. On Sept. 22 a bulletin said that he had been advised to undergo an operation. This operation, for lung resection, was performed at Buckingham palace, on Sept. 23, by Clement Price Thomas, with seven other doctors assisting.

The king appointed, on Sept. 27, five counsellors of state to relieve him of formal constitutional duties; they were Queen Elizabeth, Princesses Elizabeth and Margaret, the Duke of Gloucester and the Princess Royal. On Oct. 6 a bulletin said that the post-operative stage had passed without complication but that progress towards the convalescent stage "must necessarily be slow and gradual." After the general election he received personally, on Oct. 26, Clement Attlee and Winston S. Churchill, although this duty could have been performed by the counsellors of state. His recovery proceeded satisfactorily and on Nov. 30 he made his first journey after the operation and went with the queen to Royal lodge, Windsor, for the weekend. He cancelled the appointment of the counsellors of state on Dec. 10 and on Dec. 14 he knighted Dr. Price Thomas and Dr. Marshall, the only two of the eight doctors present at his operation, apart from the anaesthetist, who had not previously been knighted. Because his voice had not regained its normal strength, he recorded the message that was broadcast to the peoples of the Commonwealth on Christmas Day.

GERMAN LITERATURE. A visit to the Frankfurt Book fair, the representative show of the year's production,

showed that in 1951 the market in Western Germany was still overflowing with translations of foreign books and that important works of purely native origin were again few and far between.

There were a few new figures in the German literary world, most of whom seemed to be occupied with the interpretation of recent events, or rather of what was taking shape in their wake. *Zero* was a remarkable first novel by Karl August Horst: its scene was laid in Greece, agonized and rent by political faction after World War II, with a most unheroic hero trying to strike new roots. Another outstanding first novel was Siegfried Lenz's *Es waren Habichte in der Luft*, as sad and gloomy as the dark Karelian forests that provided its setting. Gerd Gaiser's *Eine Stimme hebt an* was a step further in a promising literary career: it was a tale of a soldier's return, told with an epic breadth of vision capable of overcoming darkness and despair. *In der Mitte des Lebens*, Luise Rinser's latest and most mature work, was a brilliantly painted, sympathetic picture of a modern woman determined to be mistress of her fate. In *Die Arche*, the second volume of his "Deluge" trilogy, Stefan Andres told of "the deeds and sufferings of certain citizens—selfless conspirators and lovers—who, in the face of an omnipresent tyranny, try to live like human beings"; the interwoven Noah legends once again proved this writer's mastery of the short story.

Under the pressure of the times, lyric poetry, always cherished in Germany, diminished in volume though not in quality. Wilhelm Lehmann, a prose writer who in his later years had turned to poetry, published *Noch nicht genug*, beautifully turned poems in which a feeling for nature was combined with spirituality. Werner Bergengruen's poems, some of which were collected in *Die heile Welt*, were permeated by the spirit of Christianity. From Marie Luise Kaschnitz, whose verse was musically beyond reproach, came *Zukunftsmusik*, her finest and ripest work to date. In characteristic free rhythm she saluted the future that would emerge from the ills of her time.

The essay still held its own in 1951, and many of Germany's thinkers and writers continued to look upon it as the form most congenial to the restless and fitful times. Dolf Sternberger's *Figuren der Fabel* were praised as worthy to be set beside the work of the classical French essayists. Ernst Jünger's *Über die Linie* was a concept of a coming world; it was the prelude to a later work, *Der Waldgang*, that defined the position of the strong individualist in the approaching era. *Minima Moralia*, by Professor T. W. Adorno, were highly intelligent "reflections on a damaged life," which in turn amused, intrigued and even startled their readers. The *Frühe Prosa und Reden* of Gottfried Benn dated back to his expressionist beginnings, including as they did his prose from 1914 to 1925 and his speeches and lectures between 1928 and 1950. Hermann Hesse's *Späte Prosa* and his *Briefe*, written after 1927, showed his views on life and the modern world and his broad-minded humanity. *Ungleiche Welten* was Hans Carossa's modest but deeply convincing account of his life in the "Thousand-Year Reich," written with a rare insight into human frailty and strength and confirming this author's outstanding personal position. Walter Benjamin in his *Berliner Kindheit um 1900* conjured up the ghosts of the shattered city in conclusive, unforgettable pictures. The *Nachmittag* of Reinhard Piper was a remarkable book by a remarkable personality. (X.)

GERMANY. Country of central Europe, bounded N. by the North sea, Denmark and the Baltic sea, E. by Poland, S. by Czechoslovakia, Austria and Switzerland, and W. by France, Luxembourg, Belgium and the Netherlands. According to a declaration signed in Berlin on June 5, 1945, the country was under the supreme authority of the four

Allied powers—the United States, Great Britain, the U.S.S.R. and France—and divided into the four following zones together with Berlin (*q.v.*):

Zone	Area		Population	
	(sq.mi.)	(1939 census)	(1946 census)	
British	37,723	19,785,500	22,344,900	
United States	41,506	14,257,600	17,174,400	
French	15,405*	6,088,900	5,044,000*	
Soviet	41,623	15,157,100	17,332,900	
Berlin	344	4,321,500	3,179,200	
	136,601†	59,610,600	65,035,400	

* Excluding the Saar (area, 734 sq.mi.; pop., 874,400).

† Including some small German frontier areas which, as agreed upon under the six-power agreement of March 26, 1949, were taken over by Belgium, Luxembourg, the Netherlands and the Saar respectively (total area, 52.1 sq.mi.; total pop., about 13,500).

Before the *Anschluss* of Austria the area of Germany was 181,742 sq.mi. with a population (1939 census) of 69,317,000. The British, Soviet and U.S. zones contained larger populations than in 1939; by 1946 the zonal increases were: British zone 12.9%, Soviet 14.4%, U.S. 20.5%. The additional inhabitants were mainly Germans evacuated or transferred from Poland and Czechoslovakia. Only the population of the French zone was less (3.5%) than in 1938. Language (1946 est.): German with small admixture of Lusatian (260,000 in Kottbus-Bautzen area), Polish (150,000, mainly in Westphalia) and Danish (17,000). Religion (1938 est.): Protestant 62.7%; Roman Catholic 32.5%; Jewish 0.7%; others 4.1%. Chief cities (first figure, 1939 census; second, 1946 census): Berlin (4,332,242; 3,179,200); Hamburg (1,711,877; 1,406,158); Munich (829,318; 738,018); Cologne (772,221; 489,812); Leipzig (707,365; 608,111); Essen (666,743; 520,592); Dresden (630,216; 463,032); Frankfurt-on-Main (553,464; 389,097); Düsseldorf (541,410; 421,506); Dortmund (542,261; 436,198); Hanover (470,950; 347,040).

During the year Germany remained partitioned into two states with a special provisional régime for Berlin.

WESTERN GERMANY. Area, 94,634 sq.mi. Pop. (Sept. 13, 1950, census): 47,557,926 (incl. 25,259,619 women) which indicated an increase of 3,034,626 since Oct. 29, 1946. Religion (1950 census): Protestant 51.2%, Roman Catholic 45.2%. Capital: Bonn (pop., Dec. 1949 est., 110,000). President of the German Federal republic, Theodor Heuss; federal chancellor, Konrad Adenauer (*q.v.*). Allied high commissioners: British, Sir Ivone Kirkpatrick; French, André François-Poncet; U.S., John J. McCloy. Allied commanders in chief in Western Germany (Dec. 31, 1951): British, General Sir John Harding; U.S., Lieut. General Manton S. Eddy; French, Lieut. General Roger Noiret.

EASTERN GERMANY. Capital: Berlin-Pankow. President of the German Democratic republic, Wilhelm Pieck; prime minister, Otto Grotewohl. Soviet Control commission: Army General Vasily Ivanovich Chuykov, chairman; Ivan Fedorovich Semichastnov, deputy chairman; Vladimir Semenovitch Semenov, political adviser.

History. *International.* Unification of Germany was still the goal for both Eastern and Western Germans, but no great advance in that direction was made during 1951. Grotewohl's letter of Nov. 20, 1950, proposing conversations between the two governments on the formation of an all-German Constituent council, was answered by Adenauer in a broadcast on Jan. 15, in which he laid down conditions for free, secret, direct and truly democratic all-German elections. In reply to another appeal for union the federal chancellor reminded the German Democratic republic (Feb. 10) that it had signed away a quarter of the pre-1938 territory of Germany, that since 1945 about 200,000 Eastern Germans had been placed in concentration camps and 37,000 deported to the U.S.S.R. Adenauer also suggested that the release of

political prisoners would be one proof of the Soviet zone's sincerity (Pieck announced the liberation of 20,000 prisoners in September, but by December it was still unclear how many of these were political prisoners or how many had been released).

From March onwards came numerous proposals and counter-proposals both from Pankow and Bonn. Then, on Sept. 27, Adenauer presented in the Bundeshaus a programme including the following points: in any really free elections all parties should be able to submit candidates throughout the whole country; no travel restrictions from Federal republic into Soviet zone and into greater Berlin at least three months before elections; freedom of political meeting and personal freedom as well as international protection and supervision.

About the same time the Allied High commission agreed to bring in the question of all-German elections before the United Nations and to request a preliminary U.N. investigation on political conditions in Germany, as to whether democratic elections could be held—a request rejected by Eastern Germans as "foreign interference."

As the issue of all-German elections unfolded, it became clear that the Democratic republic was concerned not with elections but with discussions which could drag on interminably. For the main Communist objective was to prevent Western Germany becoming an integral part of any Western European community, and especially to prevent its making any military contribution to the North Atlantic Treaty organization. The Communists also wanted to discuss a German peace treaty and the withdrawal of Allied troops. In a letter to the federal parliament, Grotewohl declared that "the incorporation of Western Germany in any European defence force would create a strong possibility of civil war." The Social Democrats proposed on Sept. 25 that the federal parliament should sponsor all-German elections under international control and that elections throughout Berlin should be the first step towards achieving German unity. To a similar suggestion made earlier by the mayor of West Berlin, Ernst Reuter, Grotewohl replied that he was not interested in "parish elections."

At their Washington conference the three foreign ministers stated on Sept. 14 that their aim was "a democratic Germany, on the basis of equality, in a continental European community." Agreement along these lines was reached in Paris, on Nov. 22, between Adenauer and the foreign ministers of the United States, Great Britain and France. Four gains were registered by Western Germany at that conference: complete freedom of decision for the German government; the end of economic restrictions; German control of foreign trade; and an assurance that Germany would be heard whenever its interests were involved. Many Germans were, however, sceptical because the agreement and German participation in a European army were to become effective simultaneously.

On this latter issue of rearming differences existed not only abroad but also among the Germans themselves. The Social Democrats objected to the Pleven plan—or any other—which did not first guarantee full security to the Federal republic against possible Soviet aggression. Objections also came from neutralists like Pastor Martin Niemöller who said at Frankfurt, on April 17, that Germany could best serve the cause of peace by becoming a buffer state between east and west. There was also the Emergency Committee to Save European Peace founded on Nov. 25 by Frau Helene Wessel, chairman of the Zentrum (Catholic) party, and counting among its leaders Gustav Heinemann, chairman of the Evangelical Church synod and former federal minister of the interior, who were opposed to German rearmament.

During the year the state of war between the Federal

republic and many other states was officially ended: with the United Kingdom this was announced on July 9 by a notice published in the *London Gazette*; in the United States, a proclamation was signed by the president on Oct. 24, after a resolution to that effect had been adopted by the Congress.

Chancellor Adenauer (also officially foreign minister since March 15) visited Paris to sign the Schuman plan (April 10) and again to sign the agreement on the new status of the Federal republic (Nov. 22). He was in Rome from June 14 to 20 and visited London from Dec. 3 to 8.

On March 6 the Federal republic accepted in principle responsibility for Germany's pre- and postwar debts estimated at DM. 19,000 million. Jewish claims for restitution were dealt with on Sept. 27 in a statement which promised the rapid implementation of legislation, but also stressed the limits of German capacity to pay in view of other victims' claims. Nevertheless the federal government expressed its readiness to discuss the issue with the representatives of world Jewry and the Israeli government.

While the Federal republic strengthened its contacts with the west, the Democratic republic did likewise with the east. President Pieck paid an official visit to Prague on Oct. 23 and President Boleslaw Bierut, of Poland, visited Berlin-Pankow on April 22. Eastern and Western German governments continued to be sharply divided over the frontier with Poland. The former accepted the Oder-Neisse line as the "final peace frontier" in a treaty signed at Frankfurt-on-Oder on Jan. 27. Chancellor Adenauer on the other hand declared in Berlin, on Oct. 6, "For us, the territory east of the Oder-Neisse line belongs to Germany." The western allies' point of view was that the frontiers of Germany would be finally settled at some future peace treaty.

Federal Republic. Political battles were fought mainly about international rather than internal issues during the year: Western Germany's rearming and the Schuman and Plevan plans, with the Saar problem cropping up periodically in leading debates between the government and the opposition. The Social Democrats continued to press for a new federal election (not due until 1953) because Adenauer's party, the Christian Democratic union, lost heavily in Länder elections and because the rearming was such a vital issue that the electorate should be consulted before any action was taken.

A special feature of the local elections in Lower Saxony, Schleswig-Holstein and Bremen, apart from the defeat of the Communists, was the increase in the support of the neo-nazis, the Socialist Reich party. One of its outstanding members, Otto Ernst Remer, who in the July 20, 1944, *Putsch*, played an important part on the nazi side, was sentenced on May 26 to four months' imprisonment for slandering the government. The federal government announced in November that it would seek a juridical ruling from the Supreme court on banning both the Communist and neo-nazi parties.

The Supreme court, whose function was to interpret the constitution and decide issues between federal and Land authorities, was officially constituted at Karlsruhe on Sept. 28. In its first case it decided in favour of a plebiscite on the creation of a Southwest state, out of the present states of South Baden, Württemberg-Baden and Württemberg-Hohenzollern. Voting took place on Dec. 9. Rather less than 60% of the registered electors voted and only the South Badener provided a majority against the plan; 69.8% voted for a Southwest state and 30.2% for the reconstruction of the former Länder of Baden and Württemberg.

One of the outstanding struggles in industry had been over *Mitbestimmung* (co-partnership) of employers and employees. This system was introduced into the coal, iron and steel industries of the Ruhr by the British occupation authorities and, by a law passed on April 11, it would be continued there. But important details as to the form of workers' representation

on various committees had still to be agreed on. Meanwhile, the German trade union movement (Deutscher Gewerkschaftsbund or D.G.B.) demanded that the system be extended to other industries; e.g., chemicals. Throughout the year there was only one big strike, that of the metal workers in Hesse for higher wages (Aug. 27 to Sept. 24).

Little progress was made towards a satisfactory agreement between the federal and Länder governments for equalizing of burdens or for the implementation of a six-year plan for resettling the 9 million refugees now concentrated mainly in Schleswig-Holstein and Bavaria.

Allied plans for decentralizing the iron and steel industries and for breaking up the chemical trust (Interenen-Gemeinschaft Farbenindustrie or I.G.F.) were announced on Aug. 24. A law depriving the former German owners of the legal right and title to assets abroad, thereby confirming the Allied use made of them for reparations and other claims, was promulgated on Sept. 5.

The federal budget for 1950 closed with a deficit of DM. 256.8 million. For first six months of the financial year 1951, receipts from the ordinary and extraordinary budgets were DM. 13.1 million less than expenditure. Germans attributed these deficits mainly to the heavy occupation costs and mandatory expenses. For the fiscal year 1951-52, these were fixed by the Allies at DM. 6,595 million (DM. 1,132 million more than the previous year). German demands that these charges should be reduced and converted into security costs for the upkeep of Allied forces stationed in the Federal republic and possibly later for meeting the costs of any German contingent in a European army were under consideration. The unofficial Allied estimate of DM. 13,000 million as the Federal republic's contribution for the first year of rearming was condemned as far too high by German experts. But it represented only 11% of the calculated national production for 1952, and Great Britain and France were themselves paying somewhat higher percentages for their rearming.

Western Germany received from the E.R.P. funds, from 1948 to Sept. 30, 1951, \$1,317,284,000. Of this, 50% went into industry in the form of machinery and machine tools and raw materials. Most of the rest went to improve agriculture. (The

The gateway of Landsberg prison, Western Germany, as 39 war prisoners were released on Feb. 3. Among those freed were Alfried Krupp and four former generals.

1951 harvest was a record for postwar years). From G.A.R.I.O.A. (Government Appropriation and Releases in Aid of Occupied Areas) funds \$80,340,116 was received in 1950-51. The grand total of U.S. aid amounted to about \$3,500 million since 1945.

Whereas in the spring the Federal republic had an adverse balance with the European Payments union, this was later corrected through the increase of exports and restricted imports. For October the monthly surplus in trade balance was DM. 77 million; exports were DM. 1,260 million and imports DM. 1,183 million. Ludwig Erhard, the federal minister for economic affairs, announced in parliament on Oct. 11 that the German dollar reserves amounted to \$950 million.

Production, though by Oct. 1951 only 91% per head of the 1938 figure, was phenomenal as compared with 1946 (26%). Coal was still a great problem. Daily extraction needed to be raised from 375,000 tons to 410,000 tons to be sufficient for all needs. Conditions of ownership in the industry, more houses for miners, a capital investment programme to modernize equipment and the retention of the present coal-marketing system (which the western powers rejected) were among the essential issues that the government was considering in co-operation with the German Coal board and the trade unions.

Unemployment was still very high: 1,257,000 by mid-Nov. 1951. As for the future, much would depend upon whether funds were available to continue building at the present high rate. In the previous two years over 700,000 dwellings, with accommodation for 2.5 million people, were built.

Final figures of the 1950 census showed that 9,630,000 people moved into Western Germany during and after World War II. The total was made up as follows: 4.5 million from the territory east of the Oder-Neisse line and the Saar; 3.4 million from Czechoslovakia, pre-1939 Poland and other eastern European countries; 1,030,000 from Eastern Germany (Soviet zone); 518,000 from Berlin; and 182,000 foreigners.

German Democratic Republic. Differing economic structures in Western and Eastern Germany presented different problems. Whereas the Western republic was predominantly industrial, the Eastern was mainly agricultural, but striving to become an industrial state. In 1950, Western Germany imported foodstuffs to a value of DM. 5,000 million, whereas similar imports by Eastern Germany had not 5% of that value.

Production, especially in heavy industry, was the main concern of the five-year plan, 1951-55. This envisaged an annual pig iron production of 1,250,000 tons, and of 3 million tons of crude steel. Foreign trade increased since 1949, when it amounted to DM. (East) 700 million (exports and imports, without reparations), to about DM. (East) 1,200 million in 1950 and was expected to be still higher in 1951. But 90% of this trade was with the Soviet Union and the people's democracies (the U.S.S.R. led with 50%, then came Poland and Czechoslovakia). In fact, rapid strides were made towards incorporating Eastern Germany into the economic bloc of eastern Europe. A five-year trade treaty extending to 1955 was signed in Moscow on Sept. 27.

Eastern Germany was still dependent, however, upon Western for about 50% of its machinery and raw materials, so that interzonal trade was essential for the success of its five-year plan. Yet the trade agreement signed on July 4 was not in force by December because the Eastern German government refused to remove hindrances to traffic on the international highway between West Berlin and Western Germany. This agreement was for an exchange of goods valued at about DM. 500 million—manufactured goods from the west and agricultural products from the east. Illegal interzonal trade was such a menace that any West Berlin firms caught engaging in it were threatened with the stoppage of

Otto Ernst Remer, a former soldier and in the German army, who in 1951 emerged as leader of the neo-Nazi Socialist Reich party in Western Germany.

E.R.P. aid. In October, in a single case before a West Berlin court, 15,000 tons of steel valued at DM. 9 million marks were involved.

The ownership and management of industrial concerns were further concentrated in the hands of the Sowjet Aktien Gesellschaften (S.A.G.)—entered in the trade register as owned by the Ministry of Foreign Trade in Moscow—and in the Eastern German nationalized industries the so-called *volkseigene Betriebe*. By Nov. 1951 only 26% were in private hands, and of these 2% were under trusteeship. The S.A.G. owned 66% of the chemical industry, 95% of petrol and diesel oil, 36% of brown coal and 45% of the electrical industries.

Production in April was said to be 75% (in volume) of that for 1936. But some idea of the outlook for the individual might be gathered from the fact that Walter Ulbricht, the deputy premier and secretary general of the Sozialistische (Communist) Einheitspartei, in dealing with the five-year plan promised that in 1955 it would be possible to give every person in the Soviet zone 1.24 pairs of leather shoes—a rise of 376% over 1950 supplies.

Political activities continued to concentrate upon criticism of the west. A White Book on *American-English Policy of Intervention in Western Germany and the Revival of German Imperialism* was published on Aug. 11. Party organizations were still being purged of all unreliable elements and a sharp watch was being kept on all publications. In November most of the Russian staff of the Soviet-controlled newspaper *Tägliche Rundschau* was replaced as were also some of the chief German editors of the Soviet-licensed press agency A.D.N. (Allgemeiner Deutscher Nachrichtendienst). Literature was being carefully scrutinized by a new branch of the A.D.N. Every new book was judged from the standpoint of whether it fulfilled its "intended social function." Publishing firms were controlled after some of the publications had been withdrawn because they were too "objective." Measures were first taken against current literature, but now the second-hand bookshops were also being purged of bourgeois material.

(J. E. Wt.)

Education. *Western Germany.* Schools (May 1950): elementary 28,400, pupils 6,291,000, teachers 130,400; higher elementary 579, pupils 196,067, teachers 6,011; secondary 1,488, pupils 620,488, teachers 28,872; universities 16, students 74,258, professors and lecturers 3,450; Roman Catholic theological and philosophical faculties 10, students 3,778; technical colleges 7, students 21,640. The Free University in Western Berlin had 2,000 students in 1951.

Eastern Germany. Universities 5, students (1948) 12,269, teaching staff 671. In addition there was the University of Berlin with, in 1948, 5,634 students and 157 professors and lecturers.

Agriculture. Tables I, II and III show respectively the production of main crops, the amount of livestock and the production of certain foodstuffs.

Industry. The index of industrial production, which stood at 89 in 1949 (1936=100), rose to 113 in 1950 and reached 148 in 1951. The number of persons employed in industry in Sept. 1951 was 14,884,500, or 587,500 more than at the corresponding period of the previous year; but there were still 1,234,900 unemployed. Production progress in basic industries is summarized in Table IV; 1936 is given as a measure

of comparison because the Allies considered this a year of neither boom nor depression.

A five-year plan came into effect in Eastern Germany on Jan. 1, 1951, and the Communist press estimated that the population of the Democratic republic would regain a prewar living standard by 1952. The Berlin-Pankow government claimed that the 1951 industrial production rose to the 1936 level. Eastern Germany produced in 1951 about 2.5 million metric tons of coal, about 900,000 tons of crude steel and about 100 million tons of lignite, used as raw material for synthetic oil and rubber.

Foreign Trade. Western German imports in 1951 doubled in value in comparison with 1949. As exports increased more than threefold, the adverse balance of trade was wiped out.

TABLE V. WESTERN GERMANY: EXTERNAL TRADE (DM. million)

	1936*	1948	1949	1950	1951
Imports	2,650	3,168	7,332	11,376	14,700
Exports	3,000	1,812	3,804	8,364	14,600

* Estimate for Western Germany.

Eastern German imports and exports were together estimated at DM.(East) 700 million in 1949 and at DM.(East) 1,200 million in 1950. Nine-tenths of exports were taken by the Soviet Union (50%), Poland (23%), Czechoslovakia (10%) and other people's democracies; 85% of imports were supplied by the U.S.S.R. and its satellites.

Transport and Communications. Railways (Dec. 1950): Western Germany 30,734 km.; Eastern Germany 14,400 km. Railway traffic (Western Germany, monthly average, 1950): passenger-km. 2,443 million; goods ton-km. 4,007 million; goods transported 19,360,000 m. tons. Roads (Dec. 1950): Western Germany 127,621 km., including 2,116 km. of Autobahnen; Eastern Germany 54,900 km. Motor vehicles licensed (Western Germany, Dec. 1950): 2,155,355, including 987,583 motorcycles. Shipping (Dec. 1950; Dec. 1948 in brackets): 762,263 (247,290) gross registered tons. Ships entered in Western German ports (monthly average, '000 N.R.T., June 1951; June 1950 in brackets): 708 (699). Cargo in Western German ports in external trade (monthly average, '000 metric tons, May 1951; May 1950 in brackets): loaded 820 (647), unloaded 1,578 (967). Telephones (Jan. 1950): Western Germany 2,112,728; Eastern Germany about 300,000.

Finance and Banking. *Western Germany.* Budget: (1950-51 est.) balanced at DM. 13,013.6 million, including occupation costs of DM. 4,598.4 million; (1951-52 est.) balanced at DM. 17,260 million, including occupation costs of DM. 7,300 million. National income (1950, 1949 in brackets): DM. 73,400 (64,500) million. Bank deposits (May 1951): DM. 8,200 million. Currency circulation (June 1951; Aug. 1950 in brackets): DM. 7,550 (7,420) million. Monetary unit: *Deutsche Mark*, created by the currency reform of June 20, 1948; official exchange rate (Dec. 1951): £1=DM. 11.76; \$1=DM. 4.20.

Eastern Germany. Budget (1950 est.): balanced at DM.(East) 13,500 million, including occupation costs estimated at DM.(East) 6,100 million. Currency circulation (Dec. 1951): DM.(East) 3,331 million. Although theoretically at par with the western Mark, the free exchange rate in Berlin was (Dec. 1951): DM.(West) 1=DM.(East) 4.70.

GHULAM MOHAMMAD. Pakistan statesman (b. Punjab, Aug. 29, 1895), was educated at the Mohammedan Anglo-Oriental college (Muslim university after 1920), Aligarh, United Provinces, and entered the Indian Audit and Accounts service in 1920. He later became financial adviser, communications, to the central government. During the early part of World War II he was chief controller of stores, controller general of purchase (1940) and additional secretary, Department of Supply (1941). From 1942 to 1946 he was seconded to Hyderabad state as financial member of the Nizam's government; he had also served in the Bhopal state service (1932-34). When the dominion of Pakistan was set up (Aug. 15, 1947) he became minister of finance and in 1948 took over the additional portfolio of economic affairs. On the assassination of Liaquat Ali Khan (see OBITUARIES) on Oct. 16, 1951, Khwaja Nazimuddin (q.v.) became prime minister and Ghulam Mohammad succeeded him as governor general.

Ghulam had been knighted in June 1946 but renounced his title in the autumn of that year, in accordance with the Muslim league's decision, when M. A. Jinnah's offer to form an interim government was rejected.

GIBRALTAR. British fortress colony, on a peninsula from S.W. coast of Spain covering the western outlet of the Mediterranean. Area: 2·12 sq.mi. (incl. reclamation). Pop., excl. armed forces: (1931 census) 17,613; (mid-1950 est.) 25,000. Language: Spanish (50% also speak English). Religion: mainly Roman Catholic. Administration: governor; executive council, 4 *ex-officio* and not more than 3 unofficial members; legislative council, 3 *ex-officio*, 2 nominated and 5 elected members. Governor, General Sir Kenneth Anderson.

History. The new legislative council, which had been opened by the Duke of Edinburgh on Nov. 2, 1950, got under way in 1951 and ran into no stormy weather until the autumn session when it was presented with bills introducing income tax and workmen's compensation, neither of which were popular. On April 27 an Admiralty supply vessel, the "Bedenham," blew up in the harbour; ten civilians were killed and extensive, though largely superficial, damage was done to the town, particularly to Government house and the secretariat. The big flat-building scheme continued to make good progress: the first part of it was completed by the end of the year. On Aug. 4 the Spanish government organized the first annual "Gibraltar day" to impress upon Spanish youth the continuing tragedy, as the Spaniards saw it, of occupation of the fortress by foreigners.

Education. Primary and infant schools 15 (1,638 pupils), secondary schools 6 (1,013 pupils).

Finance and Trade. Currency: sterling with local notes. Budget (1951 est.): revenue £819,000; expenditure (incl. development) £1,240,000. Foreign trade: imports (1950) £5 million; exports (incl. re-exports) £634,000. (K. G. B.)

GILBERT AND ELLICE ISLANDS: *see* PACIFIC ISLANDS, BRITISH.

GIRL GUIDES. During the festival year of 1951 practical demonstrations of the Girl Guides' ideal of service to the community through the "good turn" took the form of planting flowers to brighten city window boxes and hospital grounds, removing litter from much-loved beauty spots and setting an example of tidiness wherever they camped or held functions. They joined in the nation-wide ceremony of lighting beacons on the eve of the Festival of Britain and, at the South Bank exhibition in London as well as in towns and villages up and down the country, took part in great rallies and pageants. At the many Festival camps the general public was given an opportunity of seeing the recreational and outdoor activities of the movement. In addition, many fine indoor exhibitions and displays gave evidence of the contribution to the life of the community made by every member of the movement. Princess Margaret (*q.v.*), as commodore of the sea rangers, took the salute from 5,000 guides of County Durham after a service in Durham cathedral on May 13, and a rally and pageant were held on Oct. 6 in London for over 1,200 cadets, the young girls in training to be the leaders of tomorrow. (B. PL.)

United States. Activities in 1951 included the International Encampment of Girl Guides and Girl Scouts at Camp Wind mountain, near Stevenson, Washington, July 17-Aug. 6; the All-States Girl Scout camp, the first of its kind to be held in the U.S., July 31-Aug. 21; and the 31st national convention at Boston, Massachusetts, Oct. 15-18. During the year, girl scout units celebrated the 25th anniversary of the Edith Macy school, the national girl scout training school. The total membership on June 30, 1951, was 1,764,682. The officers in 1951 were: Dorothy C. Stratton, national executive

director; Mrs. C. Vaughan Ferguson, president; and Mrs. Amory Houghton, secretary.

GLASS. The year 1951 was a period of increasing activity—commercial, manufacturing, technical and scientific—in the glass industries of all countries. Shortage of metals caused by rearmament increased the world demand for glass. National exhibitions of unusual character enhanced public interest in glass. The demonstration of glass-making in the Power and Industry pavilion, at the South Bank exhibition, London, was popular. The "Two Thousand Years of Paris" exhibitions included "L'Art du Verre" in the Louvre, where great manufacturers of artistic glass (Lalique, Baccarat, Daum and Saint-Louis of France; Val Saint-Lambert of Belgium; Barovier and Toso, Seguso and Venini of Italy; Leerdam of the Netherlands; Kosta and Orrefors of Sweden; and Steuben of the United States) collectively provided a galaxy of specimens of beautiful craftsmanship. The centenary of Corning glass works, leading U.S. glass manufacturers, was made known to Europe in the lecture to the 1951 Design congress in London on Sept. 19 and 20 by Arthur Houghton, Jr.

Technological and scientific progress was manifested in lively discussions at the meeting in Paris, in June, of the International Commission on Glass, when research workers of nine countries presented contributions to contemporary technology.

Shortage of certain raw materials for glass-making created anxieties: particularly the world shortage of selenium, used in the glass industry for ruby glasses and for "decolourizing" commercial glasses. Methods of economizing in the use of selenium were devised, possible substitutes investigated and new world sources of selenium explored.

Continued expansion of production in the United Kingdom was demonstrated particularly in the output of containers, this was nearly 25 million gross, as compared with about 22 million gross in 1950; container productive capacity was increased by the use of electricity in glass-melting.

In many European countries, important manufacturing developments took place. In Italy, 360 glass factories employing 36,000 workers reached an output approaching 450,000 tons. Yugoslavia worked to a target of 30,000 tons of containers and 50 million sq. ft. of flat glass.

In Western Germany, 109 glass factories reached a productive capacity of more than one million tons of glass, 12½% higher than in 1936. In Austria production valued at £10 million sterling resulted from the work of 10,000 employees. The overseas expansion of the Australian glass manufacturers was continued by the erection of a factory in Bangkok. In India, the Hindusthan-Pilkington glassworks was established with the object of producing 21 million sq. ft. of sheet glass a year. In Israel, the erection of Negev Glass works at Beersheba was started, intended to manufacture 60 tons of glass containers a year, while the already established Phoenicia glassworks increased its plant and equipment for containers and window glass. (E. MGH.)

United States. In 1951 the U.S. glass industry continued to be prosperous. Glassware selling for \$1,000 million was produced in 1951 by 130,000 workers. Production reached new high levels in several fields. Competition by foreign producers of hand-made glass tableware began to be felt. Plastic substitutes for tumblers and small dishes appeared in larger numbers than formerly.

Polished plate glass production was 8% over that for 1950, which was a record year. Automobiles required the major portion of the polished plate and a great deal of the window glass. The plate glass industry made progress in the improvement of glass quality and in techniques such as the bending of polished plate. Certain of the manufacturers of plate glass established plants for making glass fibres and increasing production and widespread application of this new engineering

material was expected. Numerous patents disclosing new methods of making and using glass fibres were issued during the year.

Raw materials were in good supply, with the exception of selenium and cobalt oxide, both essential for making colourless glasses in tanks. (S. R. S.)

See J. E. Stenworth, *Physical Properties of Glass* (Oxford, 1950).

GLIDING. There were no international contests in 1951. The British National Gliding championships (no longer contests) were held once more at Great Hucklow (Derbyshire), in July. The winner was Flight Lieut. R. C. Forbes, who produced a photograph of a lighthouse to prove that he had passed over it. Both Forbes and G. H. Stephenson, runner-up, used the new Slingsby Sky sailplane. The R.N. Gliding and Soaring association's win of the Kemsley trophy for the leading club was evidence of the flourishing state of the sport in the services.

Flight Lieut. A. W. Bedford broke the British single-seat distance and "goal" records with a flight on May 2 from Farnborough, Hampshire, to near Newcastle-on-Tyne (253 mi.). P. A. Wills (awarded the Britannia trophy for 1950) set up yet another home record by soaring 163 mi. "out and return" on June 3.

In May, the Allied high commissioners "withdrew existing prohibitions on gliding" in the Federal German republic. Later in the year reports and photographs were already appearing of German competitive gliding. (G. D. H. L.)

Western Germany held its first postwar glider meeting on Aug. 25 and 26 at the Wasserkuppe. About 30,000 people attended the demonstration by 15 gliders, most of which were home-built.

The French women's distance record was broken on May 11, 1951, when Mme. M. Choisnet-Gohard flew the Air 100 for 235 mi. In France, on May 5, 1951, René Fonteillis flew a passenger in a Kranich at an average speed of 41 m.p.h. for a new record.

The Institute of Gliding in Poland created the I.S. 4 Jastrzab, an aerobatic glider with excellent stability characteristics, and the I.S. 6X Nietoperz, a tailless glider which was flown successfully. Fritz Raab, of Western Germany, produced the Doppelraab, designed to serve as an inexpensive, simple intermediate two-seat sailplane suitable for glider training. The A.M. 11 Albatros, a powered glider, was designed in Argentina by Martelli. The fuselage ended at the trailing edge of the wing, and the tail surfaces were supported by two booms. The French designed the Arsenal 4-111, a high-performance, single-seat sailplane with a predicted glide ratio of 34 to 1 at 53 m.p.h. and the Fouga CM 8-13 Aero, an aerobatic glider which successfully performed at air shows.

Three pilots earned the newest Fédération Aéronautique Internationale award, the Diamond C; John Robinson of the U.S., no. 1; Gérard Pierre of France, no. 2; and J. Shelly Charles of the U.S., no. 3.

United States. On Dec. 30, 1950, William S. Ivans, Jr., flying a 1-23, reached an absolute altitude of 42,000 ft. and an altitude-gained record of 30,100 ft. On March 5, 1951, Robert Symons and a passenger soared to an absolute altitude record for multi-seat gliders of 38,035 ft., in a Pratt Read. On Aug. 5, 1951, Richard H. Johnson set a distance record of 536·169 mi. flying his RJ-5.

The 18th National Soaring contest of the Soaring Society of America was held at Elmira, New York, during July 4-12, 1951. Thirty-five pilots participated and flew 7,093 mi. The longest flight was 363 mi. by R. H. Johnson, who became

The largest sheet of plate glass ever made, being moved into position by means of a vacuum-sucker apparatus in the Power and Production pavilion at the South Bank exhibition in 1951.

national soaring champion for the second consecutive time.

Ten pilots assembled at Odessa, Texas, for a soaring expedition. In the following five days the average distance per flight was 255·7 mi. Besides the international distance record already mentioned, W. Wiberg, on Aug. 5, 1951, flew his LK to a predetermined destination 332·903 mi. away for a new national record.

Two new designs appeared—a sailplane by Kemp Trager with a pressurized cabin for high-altitude flight, and a modification of the RJ-5. (B. Sk.)

GOA: see PORTUGUESE OVERSEAS TERRITORIES.

GOLD. Production. Extraction of gold in the main producing countries during the greater part of 1951 was carried on at a rather lower rate than in the preceding year. High operating costs and the relatively low selling price favoured by the International Monetary fund during most of the year were deterrents to higher output.

Canada. Whereas the recovery in production which set in after 1945 continued in 1950, a slight drop was recorded in 1951. During the first seven months of that year output ran at an annual rate of 4,342,000 fine oz., or about 100,000 fine oz. less than the amount raised in 1950.

South Africa. Output in 1950 was slightly lower than in 1949, and this trend continued in 1951 when, during the first nine months, production was 8,614,282 fine oz., which is equivalent to 11,485,708 fine oz. a year. Extraction in 1950 came to 11,663,692 fine oz.

World total* .	26,100	27,500	29,800	29,600	30,000†	29,600†

* Estimated. † Including an estimated 7,000,000 fine oz. for the U.S.S.R.

United States. In 1950 production of gold reached a postwar record of 2,375,130 fine oz., but during the first eight months of 1951 extraction fell to an annual rate of 1,971,190 fine oz.

Prices and Movements. During the early part of 1950 the price of gold in the free market rose to \$44 a fine oz., on the strength of hopes in the far east that the U.S. official price would be raised. This did not happen, and the price slowly went back to \$40·50. This tendency was strengthened by the moves towards an armistice in Korea in early summer. Buying came chiefly from the near east; the price fluctuated between \$40·50 and \$42 a fine ounce.

The most important event of the year came on Sept. 28, when the International Monetary fund dropped its objections to the sales of non-monetary gold at a premium. Before this many mines (particularly in South Africa) found it impossible to produce at a profit at the official rate of \$35 a fine oz., and attempts had been made to ease the position by subsidies (for instance in Canada), and by selling certain amounts of gold at a premium for industrial and private purposes against certificates, a method which was sometimes abused. During the first half of 1951 such premium sales in South Africa came to nearly £4 million. When the ban was raised Southern Rhodesia decided to sell 40% of its output on the free market. Policy in South Africa was affected by the consideration that

excessive offerings would depress the premium. The Canadian government decided to sanction premium sales, subject, however, to the withdrawal of the subsidy. Late in November, Australia decided to sell all gold produced on the free premium market.

The immediate result of the fund's decision was an increase in the free price. This was due to a shortage of gold—dealers had been keeping their stocks low pending a decision—coupled with a deterioration in the international position.

Movements of gold, as in 1950, were dominated by conditions in the United States. During 1951 it became clear that the outflow of gold from the U.S. in 1950 was merely temporary. In that year U.S. stocks of monetary gold declined by \$1,744 million; during most of 1951 stocks of gold remained stable.

There was a converse movement in the sterling area, where reserves of gold (and dollars) did, indeed, increase by \$567 million during the first half of the year; but this gain was more than lost during the third quarter, with all the indications suggesting more losses to come. Some gold had also to be paid to the European Payments union. Substantial increases were recorded in the gold holdings of the national banks of Belgium and Sweden. (W. H. JN.)

GOLD COAST. British colony and protectorate on the west coast of Africa bounded W., N. and E. by the French territory of Ivory Coast and Upper Volta and Togoland under United Kingdom trusteeship respectively. Togoland under United Kingdom trusteeship, the western part of the former German colony of Togoland, is administered with the Gold Coast.

	Area		Population	
	(sq. mi.)	(1931 census)	(1948 census)	
Gold Coast	78,650	2,869,854	4,118,450	
Togoland	13,040	293,714	382,768	

Pop.: African with Arab admixture; non-African (1948 census), Gold Coast 6,770, Togoland 51. Language: tribal dialects and Hausa. Religion: pagan, with Moslem and Christian minorities. Chief towns (pop. 1948 census): Accra (cap., 135,926); Kumasi (78,483); Sekondi-Takoradi (44,557). Administration: governor; executive council, 3 *ex-officio* ministers, 6 responsible for departments and 2 without portfolio; legislative assembly, 38 members elected on adult

Electors of Accra in the Gold Coast, lining up to vote in the colony's first general election, Feb. 1951.

suffrage partly directly and partly through electoral colleges, 18 elected by the local councils of Ashanti, 19 elected from the Northern Territories council, 6 elected by the chambers of commerce and mines (only 2 have voting rights) and the 3 *ex-officio* ministers. Governor, Sir Charles Noble Arden-Clarke.

History. The year 1951 saw the inauguration of the remarkable political experiment in the Gold Coast, the new constitution which established a legislative assembly of 84 members (75 elected) and an executive council, with the governor as president and 11 members, 8 of whom were chosen from the assembly and were removable at its instance. Elections for the assembly were held during Feb. 5-10. There was no disorder and few election offences were reported. About 80% of the electorate were illiterate.

The three main political parties were the Convention People's party led by Kwame Nkrumah (*q.v.*), the United Gold Coast convention led by Dr. J. B. Danquah and the much smaller and, as events proved, quite ineffective National Democratic party. In the 33 rural seats, for which there were 89 candidates, the Convention People's party secured 1,946 votes and 29 seats against 745 votes and 4 seats for all others, while in the municipalities of Accra, Kumasi, Sekondi-Takoradi and Cape Coast they polled 58,886 votes against 5,500 for the rest and secured all 5 seats. The new assembly had an average age of just below 40, and of its 84 members 22 were graduates and 40 had received no post-primary education. Nkrumah, who was elected for Accra with a vote of 20,780, was at the time serving a prison sentence not due to end until November, but on Feb. 12 the governor remitted the remainder of the sentence "as an act of grace on the eve of the inauguration of the new constitution." At a press conference next day, Nkrumah said: "I come out of gaol and into the assembly without the slightest feeling of bitterness to Britain." He added that the Gold Coast would remain within the Commonwealth.

On Feb. 26 Sir Charles Arden-Clarke submitted to the assembly the names of Nkrumah as leader of government business, and seven others as ministers. Six were members of the C.P.P., and the two remaining were representatives of Ashanti and the Northern Territories. These appointments were approved almost unanimously.

The government produced a development plan involving an expenditure of £74 million of which 52% was to be on economic development and communications and 33% on social services. The Volta river power project would in addition require £70 million to £100 million. The government declared its intention to proceed with this, provided the money could be raised and suitable terms agreed with the aluminium companies for the purchase of power for smelting Gold Coast bauxite.

Education. Primary schools attendance: (1950) 212,000; (est. for Jan., 1952) 270,000. Univ. coll. (1951-52): students, 340; staff, c. 100.

Finance and Trade. Currency: West African pound (£WA = £1 sterling). Budget (1950): revenue £20,564,750; expenditure £15,643,150. Foreign trade (1950): imports £44,276,174; exports £71,435,395. Principal exports: cocoa, gold, manganese and timber.

See J. R. E. Carr-Gregg, *Self-Rule in Africa* (New York, 1951); J. H. Price, *The Gold Coast Election* (London, 1951); F. J. Pedler, *West Africa* (London, 1951). (K. E. R.)

GOLF. In many respects 1951 was the most eventful year of British golf since World War II. M. Faulkner, who, at Portrush, Northern Ireland, won the first British open championship to be played in Ireland and the masters' tournament at Wentworth, was the outstanding golfer. Splendid putting and a rare determination enabled him to score most consistently and at last do justice to his great ability. Faulkner played admirably and his open victory would have been overwhelming but for a brave last round by A. Cerda. Of the other professionals J. Panton, who won the Vardon trophy, and C. H. Ward were the most consistent. The matchplay champion hit immense distances and putted ruthlessly at Hoylake, Cheshire, in beating

Kwame Nkrumah (fifth from left), leader of government business and leader of the Convention People's party, seen at Accra airport in the summer of 1951 after visiting Great Britain and the United States. Left to right: R. P. Armitage (minister of finance), K. A. Gbedemah (minister of health and labour), E. O. Asafu-Adjaye (minister of local government), J. A. Braimah (minister of communications and works), Kwame Nkrumah, T. Hutton-Mills (minister of commerce, industry and mines), Kojo Botsio (minister of education and social welfare), P. R. Branigan (minister of justice), E. Norton-Jones (minister responsible for defence and external affairs).

Harold Paddock (United States) putting at the 18th hole at Birkdale, Lancashire, in his Walker cup match with Ian Caldwell (Great Britain), May 1951. The United States retained the cup by 6 matches to 3.

F. Van Donck, T. H. Cotton, W. D. Smithers and, in the final, J. Adams, who won the Italian open a few days later. P. Thomson, a young Australian, returned a 62 at Oakdale and created a new record for major British tournaments.

The United States retained the Walker cup after a magnificent contest at Birkdale by 6-3. Two down in the foursomes, the British fought gallantly against powerful opposition. The match in which C. R. Coe, a glorious golfer, was beaten by R. J. White, the finest amateur of his generation, was probably the greatest within memory. J. B. Carr defeated F. R. Stranahan and A. T. Kyle, with the aid of a stymie on the last green, beat W. P. Turnesa, the U.S. captain. In the Ryder cup match at Pinehurst (U.S.), the British team, although defeated by $9\frac{1}{2}$ - $2\frac{1}{2}$, did as well as was expected. A. Lees became the first British professional to win both his foursome, with Ward, and his single in the U.S. F. Daly halved his single and D. J. Rees was only beaten on the last green. Faulkner and Ward played finely against the greatest U.S. players, S. J. Snead and B. Hogan. The remainder were outclassed.

The amateur championship, played in Wales for the first time, included a formidable U.S. entry at Porthcawl, Glamorgan. Most of the leading British players did not compete and although Carr again defeated Stranahan a U.S. victory was almost inevitable. R. D. Chapman in his third final played superbly and overcame Coe by 5 and 4. For the last eight holes of the game he required only 26 strokes. G. P. Roberts won the English title at Hunstanton, Norfolk, defeating H. Bennett at the 39th. The women's championship was won by an Irish golfer, Mrs. P. G. MacCann, who surprisingly beat Miss F. Stephens by 4 and 3 at Broadstone. Later in the year Miss Stephens was a member of a British team which toured South Africa. In July six leading U.S. women professionals visited England, played in two events and made a great impression by their power and technical efficiency.

F. Van Donck (Belgium) was the most successful European professional. In addition to the Silver King and North British tournaments he won the Dutch and Spanish opens and was runner-up to A. Pelissier (France) in the Belgian.

Several U.S. Walker cup players appeared in the French amateur championship and R. W. Knowles (U.S.) defeated H. de Lamaze, the best European amateur, in the final. The Vicomtesse de Saint-Sauveur remained the most elegant and effective woman player in Europe.

During the summer representatives of the United States Golf association visited Great Britain to confer with the Rules of Golf committee of St. Andrews and uniformity of rules between the two countries was agreed upon. The most important changes, which became effective on Jan. 1, 1952, were the abolition of the stymie, revised definitions of putting surfaces and hazards and, most wisely, reversion to the increased penalty of stroke and distance for out of bounds, lost and unplayable balls. In the autumn the illustrious Francis Ouimet drove himself in at St. Andrews and became the first U.S. captain of the Royal and Ancient club. (P. A. W. T.)

United States. In the 1951 U.S. open championships at Oakland Hills, Detroit, Ben Hogan, winner of the 1948 and 1950 championships, was five strokes behind at the end of 36 holes in the 72-hole test, but he won with a 35-32-67 round. His score was 287. Only one other man, Clayton Heafner, who was runner-up with 289, was able to break 70 at Oakland Hills.

Dorothy Kirby of Atlanta, Georgia, won the women's national amateur championship by defeating Claire Doran of Cleveland, Ohio, 2 and 1, in the 36-hole final match at St. Paul, Minnesota. Miss Kirby had entered her first national at 13 years of age, and had twice finished as runner-up for the title.

Sam Snead of White Sulphur Springs, West Virginia, achieved his third victory in national professional championship golf by running away from the field in the 1951 Professional Golfers' association championship at the Oakmont club, Pittsburgh.

Richard D. Chapman of Pinehurst, North Carolina, a relentless seeker after the British amateur championship for half his 41 years, finally did the trick when he defeated his Walker cup compatriot, C. R. Coe, in the final at Porthcawl, Glamorgan (see above).

Lloyd Mangrum, Niles, Illinois, and Billy Maxwell,

Odessa, Texas, also won their first major honours. Maxwell won the national amateur championship at Bethlehem, Pennsylvania, and Mangrum led all professional money winners with \$26,008, and also captured the Vardon scoring trophy with an average of 70.05 strokes a round for 104 rounds.

Apart from the competitive aspect of the game, golf prospered in every part of the U.S., notably in the open championship at the Oakland Hills club, Detroit, where a record attendance revenue of \$70,000 was taken. A following of 15,000, the largest single-day attendance in the 51-year history of the United States Golf association's classic event, saw the final two rounds of the tournament. (C. Br.)

GOVERNMENT DEPARTMENTS. The following were the chief officers of the more important public departments in the United Kingdom on Dec. 31, 1951.

<i>Admiralty, Board of</i>			
First Lord	J. P. L. Thomas		
Parliamentary and Financial Secretary	Commander A. H. P. Noble		
Permanent Secretary	Sir John Lang		
<i>Agriculture and Fisheries, Ministry of</i>			
Minister	Sir Thomas Dugdale		
Parliamentary Secretaries	Lord Carrington G. R. H. Nugent		
Permanent Secretary	Sir Donald Vandeppeer		
<i>Air Ministry</i>			
Secretary of State	Lord de L'Isle and Dudley		
Parliamentary Under Secretary	Nigel Birch		
Permanent Under Secretary	Sir James Barnes		
<i>Cabinet Office</i>			
Secretary to the Cabinet	Sir Norman Brook		
<i>Civil Aviation, Ministry of</i>			
Minister	J. S. Maclay		
Parliamentary Secretary	J. Gurney Braithwaite		
Permanent Secretary	Sir Arnold Overton		
<i>Civil Service Commission</i>			
First Commissioner	A. P. Sinker		
<i>Colonial Office</i>			
Secretary of State	Oliver Lyttelton		
Minister of State	A. T. Lennox-Boyd		
Parliamentary Under Secretary	Earl of Munster		
Permanent Under Secretary	Sir Thomas Lloyd		
<i>Commonwealth Relations Office</i>			
Secretary of State	General Lord Ismay		
Parliamentary Under Secretary	J. G. Foster		
Permanent Under Secretary	Sir Percivale Liesching		
<i>Customs and Excise, Board of</i>			
Chairman	Sir William Croft		
<i>Defence, Ministry of</i>			
Minister	*Winston S. Churchill		
Permanent Secretary	Sir Harold Parker		
<i>Development Commission</i>			
Chairman	Countess of Albemarle		
<i>Duchy of Lancaster, Office of the</i>			
Chancellor	Viscount Swinton		
<i>Education, Ministry of</i>			
Minister	Florence Horsbrugh		
Parliamentary Secretary	K. W. M. Pickthorn		
Permanent Secretary	Sir John Maud		
<i>Exchequer and Audit Department</i>			
Comptroller and Auditor General	Sir Frank Tribe		
<i>Food, Ministry of</i>			
Minister	Gwilym Lloyd-George		
Parliamentary Secretary	Charles Hill		
Permanent Secretary	Sir Henry Hancock		
<i>Foreign Office</i>			
Secretary of State	*Anthony Eden		
Minister of State	Selwyn Lloyd		
Parliamentary Under Secretaries	Marquess of Reading Anthony Nutting		
Permanent Under Secretary	Sir William Strang		
<i>Forestry Commission</i>			
Chairman	Lord Robinson		
<i>Fuel and Power, Ministry of</i>			
Minister	Geoffrey Lloyd		
Parliamentary Secretary	L. W. Joynson-Hicks		
Secretary	Sir Donald Fergusson		
<i>General Register Office</i>			
Registrar General	George North		
<i>Health, Ministry of</i>			
Minister	H. F. C. Crookshank		
Parliamentary Secretary	Patricia Hornsby-Smith		
Secretary	J. M. K. Hawton		
<i>Health, Welsh Board of</i>			
Chairman	G. C. H. Crawshaw

Minister	David Eccles
Parliamentary Secretary	Hugh Molson
Permanent Secretary	Sir Harold Emmerson

* See separate article.

GRAIN CROPS. In northern Europe, including Great Britain, a long wet winter handicapped winter cereal crops and delayed spring sowings. Conditions were better in Spain and Portugal and in eastern Europe. In India, floods caused some damage to rice, and drought was severe in parts of north Africa. Excessive dryness also caused a setback to winter cereals in the United States, but in Canada growing conditions were highly satisfactory.

TABLE I. ESTIMATED AREA AND PRODUCTION OF MAIZE

	Area		Production	
	('000 ha.)		('000 metric tons)	
	1950	1951	1950	1951
Europe (excluding U.S.S.R.)	10,500	10,800	13,000	17,000
North and Central America	39,400	40,100	83,800	83,900
South America	7,500	8,800	9,200	10,600
India	3,061	—	1,709	—
Pakistan	381	—	374	—
Indonesia	—	—	—	—
Philippines	950	—	570	—
Turkey	593	617	628	842
North and Central Africa	5,100	—	4,420	2,470
South Africa	3,300	3,200	2,633	—

SOURCE: Figures in Tables I, II and III are taken from the F.A.O. *Monthly Bulletin*. Data are not available from the U.S.S.R., eastern Europe or China. Figures for the southern hemisphere (excluding rice) relate to the 1949-50 and 1950-51 crops respectively.

The rye crop showed comparatively little change over the preceding year though it may have lost ground to wheat in the U.S.S.R. A tetraploid strain of the variety Stål was tested out in Sweden. It had much larger kernels than the normal strain, but had to be grown in isolation from the latter for proper grain setting.

There was little change in the production of oats. In North America, races of crown rust, to which the numerous varieties deriving their resistance from the variety Bond were susceptible, became prevalent.

Barley production was up on the previous year. In England, breeders worked on the production of types with greater winter hardiness.

Maize generally did well, and production in several
